MAGNUS'S ENAMELLED SLATE is handsomer and more durable than the choicest Marbles, is less than half the cost of the commonest, and is PATRONISED by her MAJESTY and PRINCE ALBERT, the Nobility, Clergy, Architects of Eminence, Engineers, Builders, Railway Contractors, and the Public generally. It is suitable for Chimney-pieces, Pier-table tops, Vases, Ink-trays, and ornaments of various descriptions, Billiard-tables, Baths, Wash-stand, and Dressing-table Trays, Door Furniture, Candelabra, Columns, Monuments, Head Stones, Mural Tablets, Pilasters, Plinths, Fonts, Grand Staircases, Balusters, &c., and is made to represent not only the marbles in ordinary use but all the more costly descriptions, as Porphyry, Rose Granite, Broccatella, Brescia, Lapis Lazuli, Malachite, and Florentine Mosaics, and has obtained the Medal from the Society of Arts. Bored Chimney-pieces, from 25*s.* upwards. Price lists sent on application to Mr. MAGNUS, PIMLICO SLATE WORKS, 39 and 40, Upper Belgrave-place, London.

*** Roofing and Plain Slate work, of all descriptions, at low prices.

LIGHT, CHEAP, AND DURABLE ROOFING.

CROGGON'S PATENT ASPHALTE ROOFING FELT is perfectly impervious to rain, snow, and frost, and has been tested by a long and extensive experience in all climates. Saves half the timber required for slates; can be laid on with great facility by farm servants, or unpractised persons. Price 1*d.* per square foot.

CROGGON'S PATENT NON-CONDUCTING FELT, for Steam Boilers and Pipes, saves 25 per cent. of fuel.

Samples and Testimonials sent by post, on application to CROGGON and Co., 2, Dowgate-hill, London.

The Agricultural Gazette.
SATURDAY, JULY 20, 1850.

MEETING FOR THE FOLLOWING WEEK.
THURSDAY, July 25—Agricultural Imp. Society of Ireland.

A GREAT amount of hard writing, and still harder speaking, has been recently bandied about, respecting bad management both on the part of landowner and tenant. Much of what has been said has undoubtedly been richly deserved, but we are rather surprised to observe that there is a class of men who, though acting a very important part in connexion with our landed interest, have not hitherto received the slightest attention from the pens of those who so freely bestow their wisdom upon both tenant and landowner. We mean the land agent.

The first and almost sole idea which occupied the mind of our landowners, seems to have been, that it was not possible to mismanage their estates. We repeat, what we have more than once urged, that landed property is not a source from whence income can be derived at will, but that it is the material of a business which, like every other business, yields returns exactly proportioned to the labour and attention bestowed upon it. The English landowner cannot turn his back on his estate for 30 or 40 years together without the certain prospect of ultimate suffering. But our office to assert this is a thankless one, so long as the general drift of the education bestowed upon our aristocracy fills their minds with the idea that it is beneath their dignity to attend to the management of their estates.

A gentleman meeting a friend expressed some surprise that he could support such an establishment by his small estate. "Oh!" said his friend, "did you not know that I had a situation—*I am my own steward.*" Let every landowner then be to the utmost possible extent his own steward; and if from the want of business habits he is unable to attend to the details, let him at least show an interest in his property by visits, not like angels' "few and far between." As tenant farmers ourselves, we can answer for the pleasure and encouragement the owner's presence gives to the industrious tenant, and the spur it gives to the indolent. For reasons which they themselves deem sufficient, it has, however, become the custom of our landowners to delegate the entire management of their estates. The first objection we make against the prevailing system refers to the terms of this contract, the usual scale of remuneration being a per centage upon the revenue, thus giving the agent a premium not upon the value of the property, but upon the amount which can by any means whatever be squeezed out of it. Nor is this all; under such a system (and it is a very prevalent one), can we wonder that there is so much land undrained, and so many ruinous buildings.

Our second objection to the general system refers to the person to whom estates are entrusted, namely, a lawyer, who from his profession can have had no opportunity of making himself thoroughly acquainted with the value of land; and as he derives a profit from every legal transaction connected with the estate, what a fruitful source of litigation, seizures, confusion, and miseries of every kind!

Nor do we object alone to the system of paying by a per centage, and to the lawyer land-agent, but we also express surprise at other individuals to whom the landlords occasionally delegate the cares of ownership; we have heard of domestic chaplains, and even of worn-out butlers who have been raised to this responsible office. An advertisement which lately appeared for a person to manage a small estate, specified as the *ne plus ultra* of other accomplishments, that the applicant must be a member of the church of England. Another advertisement from a person seeking a situation as a manager of an estate, laid great emphasis on his sole recommendation—*he was in reduced circumstances.* That he hoped such a recommendation would have weight speaks clearly enough as to the men to whom such situations are given.

But there is in other cases a still more serious mistake committed. It is by no means uncommon to entrust estates to the care of a general agent, or one who, by having a great number on hand, can take each one at a lower price than a person could afford to devote the whole of his time to it for. We know of an estate worth 2000*l.* per annum, which by this system cost the owner only 50*l.* per annum for management, or 2½ per cent.! No doubt he chuckles at the cheapness; and yet the agent will certainly get not less than 10*l.* per day for the time he bestows upon it. A person of very moderate skill, by devoting proper time and pains to the management of this estate, could easily add 300*l.* to its annual value, whereas, under the present system, the rent roll is diminishing, the land undrained, and buildings deplorable. Landowners have yet to learn that cheap labour is in this case, as in every other, most certainly the dearest.

To manage landed property in the most efficient manner requires a rare combination of business tact and judgment, on the part of the agent, with perfect confidence on the part of the owner. We have been told of a gentleman who prefaced his instructions to his agents with the following sentence—"In the first place, remember the land is mine and not yours." Such language is plainly significant of the style of men he must have been addressing, and of the system upon which his estates must have been managed.

It is so obviously the interest of a landowner to give every encouragement and security to his tenant, that had we not often seen the very opposite opinion acted upon, we must have apologised for alluding to such a self-evident fact. To those landowners who are content to act upon the short-sighted plan of yearly lettings and no lease, an agent has a very simple path to follow. But to those who really desire that their estates should be to themselves and their descendants a source of steady and improving income, the agent assumes at once his proper position between landowner and tenant; protecting the former from injury and the latter from oppression in case of unforeseen variations in the market. But if the cases are rare where the agent combines sound business habits with a thorough knowledge of the value of land, they are unfortunately still rarer, where the landowner having found such an agent, allows him to exercise his abilities.

Such is the keen competition for land that landowners need be under no fear of getting the full value of their property—what they require most of all is to be guided by their own or their agents' estimate of its value, and not by the *promises to pay* which they will receive if the land be let by public auction—a most foolish practice; and when we consider that the owner has at least a life interest in the estate, and the bidders at such an auction only a yearly one—which party is the most likely to suffer by over cropping to make up an extravagant rent?

That the landowners themselves are the parties most to blame for much of the mismanagement that exists must be admitted, but at the same time we cannot overlook the very important part which is filled by the land agent—to whose ignorance, arising from his previous position, or from his present profession as a lawyer—superadded to such miserable pay as we have above alluded to, very much of the present state of agriculture must undoubtedly be traced.

As an example of the way in which estates ought to be managed, we will mention the system pursued upon one of the largest in the north of England. At the head of it is a gentleman so thoroughly versed in business, as to be capable of transacting it with any of the numberless interests connected with princely estate. He is assisted by men who are required to give their undivided attention, and are paid accordingly. When any tenant feels himself aggrieved by his rent — instead of the farm being offered to public competition—two valuers are appointed, and at whatever price they fix, the tenant has the first offer of the farm. So well has this plan worked that in every case the offer has been accepted, and what will we believe be without a parallel, there has not even this year been one farm offered to the public.

THE citizens of Exeter certainly have most successfully exerted themselves to do honour to the meeting of the Agricultural Society during the past week. Never was a city so decked out with flags and Laurel boughs before. The streets from end to end are covered with gay colours, and from side to side almost everywhere traversed by green arches ornamented with appropriate mottos. The weather has been all that could be desired; and, accordingly, the place has been very full of visitors. The Show neither of cattle nor implements has been so large as we have known it: but this has been advantageous rather than otherwise; for both at Norwich and at York it was unwieldily large. For a detailed report of the Exhibition, we must refer to another page.

PRINCIPLES OF CATTLE INSURANCE.

IT is somewhat cheering to see publicly announced so many thousands of pounds, as the directors of our insurance companies tell us they have paid for dead cattle, more especially as they also inform us that these sums would have been lost—entirely lost—to the farmers, but for these insurance companies. This sounds all very fine, but the question occurs, from what source does the money so paid arise? Are the directors of these companies so patriotic as to put their hands in their own pockets? This could scarcely be expected. In my opinion it just amounts to this: those farmers who insure their stock are pleased to constitute the directors of the insurance companies their bankers, &c., and in return, the directors, in accordance with certain conditions, pay back the farmers part of their own money. Premising this to be the case, let us examine whether this system is likely to be a profitable investment for the farmers' cash.

The average amount of premium payable for the different classes of animals insured, including districts where pleuro-pneumonia has visited (and where has it not been?), is rather above four per cent., that is, for 100*l.* insured he pays 80*s.*; but as the insurance company agrees to pay only three-fourths of the sum so insured—say 75*l.*, which is *bona fide* the sum really insured — then the premium is rather above 5¼ per cent. There are also a few items which bear heavily on the insured: there is, first, 10 per cent. to be deducted from the insurance money on all young stock that die of quarter-ill; also on all stock that die of pleuro-pneumonia; and again salvage claimed by the company—a sum, I should suppose, ranging from 10*s.*, the minimum for young stock, to perhaps 30*s.*, the maximum for grown beasts (20*s.* being the minimum for them). For the sake of illustration, suppose a farmer insures 20 stirks, from 6 to 18 months old, and averaging 5*l.* sterling value—say 100*l.*; for this he pays 5*l.* premium. I shall also suppose that two of the said stirks die of quarter-ill during the current year of insurance (nine-tenths of the stirks that die do so of the above disease). And here I would beg to state, that having had 30 years' experience among cattle, I consider the proportion of deaths here allowed as being too large; what with setoning, plenty of Turnips, and exercise, &c., not many young beasts die. However, admitting that 10 per cent. die, let us see the farmer's balance sheet at the close of the year of insurance, &c.:

Balance-sheet, Insurance of 20 *Stirks, &c.*

Premium paid ...	£5	0	0	By three-fourths of value insured ...	£7	10	0
Loss of cattle, two stirks	10	0	0	Deduct salvage, 12*s.*6*d.* each,	£1	5	0
One year's interest of premium ...	0	5	0	Deduct 10 per cent, &c. ...	1	0	0—2 5 0
Value lost, &c. ...	15	5	0				
Money paid by insurance company	5	5	0	Money paid by insurance company	5	5	0
				Net balance &c. ...	10	0	0
Net balance lost to the farmer ...	£10	0	0		£15	5	0

So much for the insurance of young stock; and sure I am the case would be still less favourable for insurance as regards full grown animals. In ordinary circumstances, I do not think that 5 per cent. of these die annually. In the case of pleuro-pneumonia, or any such diseases that sweep away a number of cattle, individuals may profit; but, as a matter of course, the insurance companies will endeavour to avoid these diseases as much as possible, their maxim also being, "Where extra risk to charge an extra rate."

So far as known to the public, no kind of sound basis exists for the proper calculation of tables applicable to

the insurance of cattle, &c. The principles by which the insurance of human lives is conducted will never work fairly and equably if applied to cattle. There is this important and essential difference: that as regards human life, there is an absolute certainty that all must die, and in all cases it is desirable that death should be a natural process. To effect this object every exertion, and almost any sacrifice, will be made: this never-failing law is the foundation on which all insurance calculations are made. The period at which human life will terminate being a contingent circumstance, but of the utmost importance, the probabilities connecting it with insurance are deduced from statistics furnished by the most careful and prolonged observations, the philosophy of which is generally termed the doctrine of chances.

As regards cattle, the two essential elements here adverted to are wanting: 1st. Although it is the fact that a few cattle will die a natural death, it is not necessary that any should do so. The peculiar position cattle occupy in connection with our social economy accounts for this; every part of the carcase being valuable after death—and this value depending in a great measure on the circumstance of the animal not having died a natural death—it becomes the aim and interest of the owner to put the animal as quickly as possible into that state in which the carcase is found to be most useful, and having done so, to deprive it of existence. This being the fact in ordinary circumstances, there must, of necessity, be few natural deaths among black cattle; and I believe, that in the neighbourhood of large towns very few are allowed to die, most being sent to the butcher as soon as they give evidence of decay or disease. Horses would require the application of principles in themselves essentially different from those applied to the circumstances of cattle; the carcase of the horse being comparatively of little value, he will, in general, be allowed to die a natural death. It is granted that many horses are destroyed; but this rarely takes place so long as the value of the labour which can be extracted from the animal exceeds in any considerable degree the value of keep and the expenses necessary for conducting his operations. It may therefore be said of horses, that previous to destruction, they were dead to any useful purpose. I may mention, however, that insurance companies do not hold themselves bound to pay for animals wilfully destroyed, notwithstanding they may be useless. This regulation requires revision. A horse, by accident, may get his leg broken—still this horse would not die, and therefore the owner loses the insurance; or he can be so affected by disease of any peculiar character as to render him useless, yet if he does not actually die there is no payment made. Again: an animal may be labouring under an incurable disease, but if he survive the 366th day from the date of insurance, the owner is the loser. It is probable that should the farmer wish to renew his policy for another year, these diseased animals would be excluded from the new schedule; so that after the owner has paid the premium almost up to the hour of death, all is lost. Again: there would require to be a very wide difference in the amount of premium charged on horses employed at farm-work and those used by carriers, stage-coach proprietors, &c., the latter employments being much more destructive of animal life than the former.

Insurance companies ought to confine their operations to one, two, or at most three adjoining counties, having all their affairs conducted by a local administration. After having properly organised a society, their first act should be to put themselves in possession of the most correct statistics of the rates of mortality among cattle and horses that circumstances will admit. For this purpose I would engage the co-operation of schoolmasters of parishes, and resident factors on estates, &c.; this agency to be co-extensive with the area of the company's operations. Each of the agents so employed to be furnished with a number of schedules properly constructed, so as each farmer in the respective localities might record for each of the five preceding years, the number of cattle, sheep, and horses kept—the number of deaths in the different classes of animals—the diseases supposed or real of which the animals died, with the ages at which death took place—and the breeds of cattle and horses—the nature of work the horses were employed about—also the breeds of sheep, with the nature of their walk, &c. Owners' names to be concealed if requested. Reports to be given in by a fixed date, and a small salary allowed the agents for their services. I am very far from expecting that returns procured on the above plan would be correct, as regards the mortality of cattle; still they would be a near approximation to the truth, and from them tables could at once be constructed, indicating rates of premium which, being computed and deduced from statistical facts, must be intrinsically valuable and suited for practical purposes. I am also of opinion that the mutual plan of insurance is best adapted for the lower animals. It would tend to keep up the interest of the community in the Society's operations, and by adopting the system of division of profits, there would still be, as it were, a link connecting the one year with the other. The amount of money overpaid by any member could be returned to the individual members, or carried forward as part payment of premiums for the year following. I have thus endeavoured to show the evils of the present insurances, and suggest plans for the future. The cause is worthy the attention of the public, and I trust some of your numerous readers will take up the subject in earnest. I shall close with a few remarks on the principles of insurance in general, and their adaptation to cattle in particular.

To the most superficial observer it is evident that insurance companies are intended to stand in the same relation to the working of our social economy that a balance-wheel does to the working of machinery. There are only two ways in which a balance-wheel is useful to machinery—first, where the motive power does not exert a uniform degree of force; second, where the work to be done does not present a uniform degree of resistance. In machines where the motive power constantly maintains the same degree of force, and where the resistance to be overcome is of the same character, the balance is useless—it is injurious; a balance therefore is not a generator of force—it merely accumulates; and the amount of accumulated force cannot in any case exceed that spent by the motive power in its accumulation, but must in all cases be minus the friction connected with the balance. Insurances are accumulations of power (of a certain kind) fitted to meet and overcome any undue or uncommon pressure on society in general on some of its relative parts, such as the destruction of property or life by fire, water, or tempest—the demise of the head or support of a family—the approach of old age and consequent helplessness, or the visits of sickness, &c. Still all these circumstances are different from the ordinary routine of business, and are fit subjects for insurance. It must, however, be borne in mind that all insurances are like the balance, subject to loss of power by friction (expenses of management); therefore the selection of subjects for insurance requires discrimination. There are only two circumstances in which cattle insurance can be beneficial: the first is where epidemical diseases make their appearance, and threaten to sweep away whole herds at once, thereby becoming absolutely ruinous to individuals; and the second is where poor cottagers, having only one or two cows, come to lose them. Under these circumstances the cases are ruinous, and insurances would be decidedly beneficial. But, with the above exceptions, the deaths of cattle are so few in number, and so uniform in occurrence, that they cannot be viewed as ruinous visitations, but rather as the ordinary tear and wear of farming.

I have already stated it as my opinion, that cattle in this country are not very subject to epidemical attacks; and where these do appear they are much more mild in character, and therefore not so fatal, as they are among our continental or our English neighbours. Most, if not all, of the fatal epidemics that have visited Britain have had their origin in the damp marshy countries of the continent; and I have no doubt but that the system of draining now so vigorously pursued in this country, by improving the climate and the pasture, will have the effect of lessening the amount of disease among cattle in a very great degree. Moreover, most of the cattle insurance companies having had their origin since the appearance of the late and present epidemics in England, the premiums are necessarily high—they may be said to have been calculated on the war establishment principle. It remains to be seen what the peace establishment principles are. *A Practical Farmer, in the Scottish Farmer.*

Home Correspondence.

Appearance of Crops.—Having just travelled through the part of the country named in the enclosed note, though by railway the view is not satisfactory, I send my notes, which you are at liberty to use if you think fit.

	Wheat.	Barley.	Peas and Beans.	Grass.	Potatoes.
Totness to Exeter ...	Good, late.	Good, late.	—	Good.	V. good.
Taunton	Do.	Do.	V. good.	Do.	Good.
Gloucester ...	Do.	Do.	Moderate.	Moderate.	Do.
Tewkesbury	Do.	Do.	Do.	Do.	Moderate.
Worcester ...	Do.	Moderate.	Do.	Do.	
Droitwich	Moderate, bad.	Do.	Do.		
Birmingham	Good.	Good.	Good.	Do.	Moderate.
Blisworth ...	V. good.	Do.	Do.	Do.	Do.
Thrapston ...	V. good.	Do.	V. good.	Do.	Do.

But little Wheat or Barley in ear from Totness to Birmingham; from Blisworth to Thrapston Wheat in ear and crops very good. Land apparently not very well farmed S.W. of Birmingham; much draining required in many places. Between Bristol and Birmingham, four horses stirring the fallows, land apparently lightly stocked by sheep and cattle; much land in preparation for Turnips, but not many Turnips yet safe; hedges high and crooked, and in many places smothered with timber; very few corn stacks, indeed. Potatoes North of Gloucester injured by frost. *R. L. O.*

Rural Institutes.—The very favourable notice my pamphlet on the Establishment of Adult Schools in Agricultural Districts received in your Paper induces me to forward to you the enclosed prospectus. The object, if not entirely similar, is kindred in its nature, that of introducing a higher standard of knowledge in country districts. Your valuable paper will form a leading feature in our institute, and will be most useful and attractive, as we have a village horticultural society, to which nearly all the farmers belong. But why do I request you to insert this prospectus? Because, besides the actual usefulness of the institute, I anticipate that much good will emanate from the project. Our farmers will meet together on friendly terms—I hope not to grumble at the times, but to compare experience and to devise methods for improved practice in the several departments of rural economy. Nor do I anticipate in this movement less advantage to myself. Though my heart is always with my kind brothers, the farmers, I regret that personally I am but little amongst them. The curate of two large and straggling parishes (in one of which are 17 miles of road), cannot see his respected friends so often as he could wish, nor, as he would fain believe, they wish to see him. But here he hopefully looks forward to the constant interchange of friendly commerce, perhaps not seldom having for its theme the welfare of themselves and others. The next object we should all have at heart, after doing good in our own locality, is that of extending similar benefit to others. For this reason I advocate my plan in your widely circulated paper. But it may be objected chapels are not to be found in every parish. Indeed I most sincerely hope not. A room, however, sufficiently large for the purpose, if not to be hired, can be run up at a very trifling expense by every enterprising country squire who has the interest of his tenantry at heart. "PROSPECTUS.—An opportunity having occurred of hiring the Methodist chapel (at ——), it is proposed to open it as a reading-room, and to supply it with agricultural and local papers and magazines. It is thought that this plan will be the means of promoting much moral good, and of affording instruction and amusement to those who have a little leisure time at their command. It is anticipated also that the farmers will derive much advantage, by obtaining the latest and most authentic intelligence as to the state of the markets, and the best and most recent records of agricultural improvements. It is proposed to take in the following publications:—The Norfolk Chronicle, the Gardeners' Chronicle and Agricultural Gazette, Bell's Weekly Messenger, the Mark Lane Express, the Illustrated London News, the Farmers' Monthly Magazine, and Half Hours with the best Authors. To the above list will be added other papers or magazines, as the funds will admit. Terms, 2*s.* 6*d.* per quarter, paid in advance. The institution will be opened from 9 o'clock in the morning till dusk, commencing on the Monday after old Midsummer-day, the 7th July, at 1 o'clock." *A Country Curate.*

Garden Farm.—It would be very interesting to know the plan which our friend "the Country Curate," has been led to adopt with respect to his garden farm, after the numerous and diversified counsel tendered to him through the medium of your Paper. If he will be kind enough to afford us that information, and after the harvest has been gathered give us the actual results of his first attempt, he would greatly oblige one of his advisers. *T. P. H.*

Societies.

ANNUAL MEETING OF THE ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

EXETER, *July* 17.—There is a very obvious diminution in the number of implements exhibited, when the present show is compared with those of York and Norwich. The 146 exhibitors at the former meeting, and the 145 of the latter, are here reduced to 118; and the average number of implements also, exhibited by each, is not so great. And this difference, it must be confessed, is greatly to the advantage of the Exeter meeting. For as it is, there are upwards of 40 ploughs in the yard, a dozen subsoil pulverisers, 30 drilling machines, 8 manure distributors, more than a dozen steam-engines, two dozen threshing machines, 20 corn-dressing machines, 50 grinding-mills and corn-crushers, two dozen chaff-cutters, 14 Turnip-cutters, 7 oilcake breakers, 29 carts and waggons, 11 draining-tile machines, and numerous sets of draining tools, 19 sets of harrows, two dozen cultivators or scarifiers, two dozen horse-hoes, besides numbers of horse rakes, horse seed dibblers, cider mills, hand drills, liquid manure distributors, haymaking machines, Gorse bruisers, stoves and steaming apparatus—not to speak of Barley hummellers, barrows, Bean splitters, bedsteads, cheese presses, churns, clod crushers, farm railways, fencing, fire engines, forks, garden chairs, gates, hand dibbles, harness, horse power, hurdles, mangles, models, pumps, rick stands, rollers, sack-holders, seeds, spades, straw shakers, troughs, vegetable washers, watering machines, weighing machines, wheels, whipple-trees, and 60 or 70 "other articles" not capable of being classified among the preceding. And visitors have thus no lack of materials from which to select either their purchases, if they are making a business transaction of their visit, or their models of excellence, if they are merely desirous of knowing the present state of agricultural mechanics. And in either case they are much the better for the absence of that overwhelming number of articles which, at Norwich, helped to confuse them.

The prizes offered by the Society take in the whole range of agricultural machines; implements of cultivation previous to the seed-time, as ploughs and harrows, and cultivators, paring ploughs, and pulverisers, and manure distributors; implements for depositing the seed, as drills and dibbles for corn and smaller seeds; implements of cultivation during the growth of the crop, as horse hoes for wide or narrow intervals; machines employed in harvesting the crop, as carts and waggons; and in preparing it for food or for market, as threshing and winnowing machines, cider mills, Gorse bruisers, and Turnip cutters, corn crushers and cake breakers—all are patronised. For steam-engines, not included in this list, two prizes, 50*l.* and 25*l.*, are offered; and the machines which compete for these prizes are perhaps the most remarkable feature

of the whole exhibition. The following is the award of the judges of implements :

AWARD OF THE JUDGES OF IMPLEMENTS.

Kind of Implement.	Prize. £	No. of Stand.	No. of Article.	Name of Exhibitor.
For the Plough best adapted for general purposes ...	7	68	1	William Ball, Kettering, Northampton
For the Plough best adapted for deep ploughing ...	7	10	4	John Howard and Son, Bedford
For the best—				
One-way or Turn-wrest Plough	5	87	1	Henry Lowcock, Collumpton, Devon
Paring Plough	5	78	1	Thos. Glover, Thrassington, Leicester
Subsoil Pulverizer	5	10	8	J. Howard and Son, Bedford
Drill for general purposes ...	10	76	2	R. Garrett and Son, Saxmundham, Suff.
Pair-horse Steerage Corn and Turnip-drill	10	8	2	R. Hornsby and Son, Grantham, Lincolnsh.
Drill for small occupations...	5	76	10	R. Garrett and Son
Turnip-drill on the flat ...	10	8	3	R. Hornsby and Son
Turnip-drill on the ridge ...	10	8	4	Ditto
Drop-drill for depositing seed and manure	10	76	5	R. Garrett and Son
Manure distributor	5	34	13	Holmes and Son, Norwich
Portable Steam Engine, applicable fo Threshing or other agricultural purposes	50	8	9	R. Hornsby and Son
For the second best ditto ...	25	5	3	Clayton, Shuttleworth and Co., Lincoln
Portable Threshing Machine applicable to horse or steam power*	20			
Corn-dressing Machine ...	10	8	8	R. Hornsby and Son
Grinding-mill for breaking agricultural produce into fine meal*	10			
Linseed and Corn Crusher ...	5	64	5	W. P. Stanley, Peterborough
Chaff Cutter	10	72	1	J. Cornes, Barbridge, Nantwich
Turnip Cutter	5	25	2	B. Samuelson, Banbury, Oxon
Oilcake Breaker for every variety of cake	5	92	3	W. N. Nicholson, Newark-on-Trent, Notts
One-horse Cart for general purposes	10	18	17	W. Busby, Bedale, Yorkshire
Light Waggon for general purposes	10	4	26	W. Crosskill, Beverley, Yorkshire
Machine for making draining tiles or pipes	20	9	1	H. Clayton, Park-pl., Dorset-sq., London
Set of Tools for general draining	3	89	42	Mapleback and Lowe, Birmingham
Heavy Harrow	5	28	3	Williams and Taylor, Bedford
Light Harrow	5	10	20	J. Howard and Son
Cultivator, Grubber, and Scarifier	10	62	5	Smith and Co., Stamford
Pair-horse Scarifier ...	5	71	1	E. H. Bentall, Maldon, Essex
Horse-hoe on the flat ...	10	76	14	R. Garrett and Son
Horse-hoe on the ridge ...	5	18	6	W. Busby
Horse-rake	5	10	26	J. Howard and Son
Horse Seed-dibbler, or Seed depositor not being a Drill	10	...	...	Prize withheld
Cider Mill*	10			
Barrow Hand-drill, to work with cups	3	76	13	R. Garrett and Son
Liquid Manure distributor ...	10	59	1	T. R. and J. Reeves, Westbury, Wilts
Haymaking Machine ...	5	62	1	Smith and Co., Stamford
Gorse Bruiser*	5			
Cottage Stove or Range for burning coals	5	92	7	W. N. Nicholson
For the best and most economical Steaming Apparatus for general purposes ...	5	64	2	W. P. Stanley
For Improvement to the Steerage, and adoption of Vulcanized India rubber pipes in place of tin conductors for seed ...	Silver Medal.	8	2	R. Hornsby and Son
For Draining Plough and Windlass, and Pipe-making machine ...	Silver Medal.	75	1, 2, 3, 4	J. Fowler, jn., Melksham, Wilts
For Expansion Movement in Horse-hoe	Silver Medal.	84	5	Edward Hill and Co., Dudley
For a Double Cistern Patent Agricultural Fire-Engine	Silver Medal.	58	3	R. Read, Regent Circus, Piccadilly
For a New Patent Cottage Stove	Silver Medal.	92	15	W. N. Nicholson
For a Patent Churn ...	Silver Medal.	25	17	B. Samuelson
For a Permanent and Portable Farm Railway	Silver Medal.	4	61, 62, 63	W. Crosskill

* Trials not completed at time of going to press.

Highly Commended.—General Purpose Drill, Stand No. 8, Article 1, Messrs. Hornsby and Son ; Liquid Manure Drop Drill, Stand, No. 59, Article 2, Messrs. Reeves ; Plough for General Purposes, Stand No. 18, Article 3, Mr. W. Busby ; Uley Cultivator, Stand No. 4, Article 50, Mr. W. Crosskill ; Clod Crusher, Stand No. 4, Article 4, Mr. W. Crosskill ; Steam Engine, Stand No. 76, Article 22, Messrs. Garrett and Son.

Commended.—Small Dibbling Drill, Stand No. 18, Article 18, Mr. W. Busby ; Horse-hoe for small occupations, Stand No. 61, Article 2, Mr. W. Smith ; Hand Manure Distributor, Stand No. 73, Article 7, Messrs. Dufaur and Co., 21, Red Lion-square, London ; Plough for Deep Ploughing, Stand No. 81, Article 4, Messrs. W. Hensman and Son, Woburn, Beds ; Subsoil Pulveriser, Stand No. 80, Article 4, Messrs. R. Gray and Son, Reddington, near Glasgow ; Horse-hoe on Ridge, Stand No. 76, Article 6, Messrs. Garrett and Son ; Norwegian Harrow, Stand No. 4, Article 51, Mr. W. Crosskill ; Potato Plough, Stand No. 35, Article 3, Mr. John Milward, Newton Abbott, Devon ; Gutter Plough, Stand No. 91, Article 4, Mr. Thomas Moore, Newton St. Cyres, Exeter ; Wrought-iron Skim, Stand No. 84, Article 2, Messrs. Edward Hill and Co. ; Tile Machine, Stand No. 17, Article 2, Mr. John Whitehead, Preston, Lancashire ; Winnowing Machine, Stand No. 81, Article 10, Messrs. W. Hensman and Son ; Chaff Machine, Stand No. 62, Article 6, Messrs. Smith, Stamford ; Steam Engine, Stand No. 12, Article 1, Messrs. Deane, Dray, and Deane, Birmingham ; Steam Engine, Stand No. 39, Article 43, Messrs. Barrett, Exall, and Andrews, Reading.

B. T. Brandreth Gibbs, Hon. Director of the Show.

Judges of Implements—Mr. C. J. Carr, Mr. Wm. Lister, Mr. Thos. Scott, Mr. Chas. Paget, Mr. Owen Wallis, Mr. W. Owen, Mr. John Overell, Mr. I. H. Nalder, Mr. Thos. Hawkins, Mr. Outhwaite. Consultin Engineers—Messrs. Easton and Amos.

With all these commendations and awards, we have not noticed much novelty in the yard. Probably the only important instance which can prefer any such claim is the drainage apparatus invented and exhibited by Mr. Fowler, of Melksham, where a common mole plough is employed to draw in after it a chain of wooden pipes, socketed into one another, and connected for the time being by a rope passing through 40 or 50 of them, and fastening on to the plough. In using this instrument a series of pits are dug in the intended course of the drains ; the plough commences operations at the first, being furnished with a ropeful of tubes long enough to last till it arrives at the second pit, when the rope is detached, pulled through the tubes, and employed again between the second and third pits, with a fresh set strung upon it. In the case of soft ground, where the tunnels made by the mole plough would soon fill up, this method of rendering them permanent seems likely to be useful. Mr. Fowler's implements include—(1.) A portable saw mill, for manufacturing square blocks of wood from the refuse material which is usually split into firewood, such as the crooked branches and butts of trees, pollards, and other useless timber ; it is cut up by means of two circular saws, working on the same bed, driven by a portable farm engine, by strap on a pulley 6 inches wide, 14 inches diameter, the fly-wheel being 6 feet, the saw travelling at speeds varying from 700 to 1400 revolutions per minute. It requires with the next article for boring the pipes not less than 10-horse power. Price 70*l.* (2.) Two lathes on one bed ; invented by the exhibitor, and manufactured by William Eyres, of Melksham. These lathes are for manufacturing the blocks of wood cut out by the saw mill into pipes, and making a spigot-and-fauset joint to the same ; also for boring the holes in the sides necessary to admit the water. The poppets are mounted on an inclined bed, and the tool travelling ; the piece of wood is fixed on a sliding bench, which is forced down against the tool. The lathes are driven by a strap 2 inches wide, and require about half a horse-power, at speeds varying from 400 to 700 revolutions per minute. Price 12*l.* (3.) A draining plough ; invented by the exhibitor, and manufactured by Stratton and Co., of Bristol. A mole or plug plough, for making a hole in the soil at depths varying from 2 feet to 4 feet, and at the same time drawing into the hole thus made any draining materials, such as earthen or wooden pipes, straw ropes, &c., &c. ; with apparatus attached for raising or sinking the plough, so as to lay a level drain under an uneven surface. Price 8*l.* 10*s.* (4.) A windlass, for drawing the above. This windlass is drawn forward by horses walking in a circular course, a rope being twisted round a drum, which forms part of the windlass ; the rope is fastened at each end, and the friction causes the windlass to travel forward with the plough or implement attached to it. The horses, by this means, are prevented from constantly treading on the same spot, as they describe circles from different centres at each revolution. The size of the drum varies from 14 inches to 3 feet ; length of levers, 12 feet 6 inches. Price 5*l.* 10*s.*

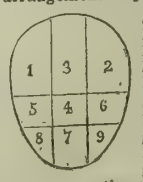
Of course this mode of draining is liable to all the difficulties to which the ordinary mode of using the mole plough is obnoxious. The even incline of the tunnel, which is almost essential to its efficiency as a drain, can be obtained only by a corresponding even incline of the surface over which the framework of the plough slides ; and, accordingly, this machine is fitted for use only on lands of tolerably regular surface ; and that the texture of the land below the surface be also sufficiently uniform seems also necessary. A stony subsoil would spoil its applicability.

There is another article exhibited which also seems to deserve particular notice, and that is, a portable farm railway, exhibited by Mr. Crosskill, of Beverley. The rails, manufactured in parts or lengths, are 15 feet long by 2 feet 11 inches wide, and 2 feet 6 inches gauge ; the ends fit into iron sockets : the wood rails are made of the best red deal, strongly put together, and edged with iron, and made to carry 15 cwt. loads. The portable railway is very serviceable for taking off Turnips, and is much better and cheaper than carts going upon the wet land, and doing considerable damage. With 100 yards of rail a quarter of an acre may soon be cleared, the Turnips being gathered up six yards on each side of the rail. Two active boys will move it 100 yards further on, and replace it in less than ten minutes. The following is an estimate of the cost of a portable farm railway to carry 15 cwt. loads :—

	£	s.	d.
100 yards, or 20 lengths of rail, at 2*s.* 6*d.* per yard ...	12	10	
1 truck, with side tippers, to tip on either side... ...	5	0	
1 truck, with end tippers, to tip at one end	5	0	
1 turn-table	5	0	
Extras.—2 sets of points, with cross double rails, each 15 feet long	5	0	
2 sets of double rails, to join the double lines, each 15 feet long	3	0	
6 turning curves, to join a double line, or change the course, each 10 feet long	3	0	
	£38	10	

A stronger set was exhibited, calculated for the carriage of 40 cwt. loads ; and though we do not suppose that portable railways will be brought into much use in ordinary farm management, yet lines so far portable as to be capable of easy removal once a year, are not uncommonly employed in the carriage of corn from rickyard to barn ; being removed during harvest time, when access to the yard is required for the ordinary carriage of the farm ; and these schemes of Mr. Crosskill's seem well adapted to this end.

A walk round the yard will not, excepting the above instances, display much novelty. The same machines appear as were shown last year. There is, however, improvement to be noticed in details. Thus, in the first stand, Mr. Phillips, of Bristol, has adopted a sort of circular grate to Gardner's Turnip cutter, which hinders the last piece of the Turnip from coming out uncut, as it was previously liable to do.—In Stand 3, Messrs. Stratton and Hughes, of Bristol, exhibited a plain-sided one-horse cart, with 2½-inch wheels, iron stocks, and iron axles. In this cart, strength and simplicity of structure are combined, and the use of mortices, projections, and carving is avoided. The body is of the full size of 5 feet by 3 feet 6 inches, and contains about a cubic yard when filled level with the top, and when heaped will contain a yard and a half or more, or other light material. It is believed that this cart possesses the following advantages over all others hitherto introduced. A larger capacity of body with the same weight and strength of material—the body nearer to the ground, having regard to the height of the wheels—diminished draught to the horse when travelling—ease and convenience in filling and emptying. This cart has wooden wheels, of the best and most durable description, manufactured by the exhibitors' newly-erected wheel-making machinery. Price, with 2½-inch wheels, 11*l.* ; with wing boards, 15*s.* extra ; with head and tail ladders, 20*s.* extra ; with single hay frame, 30*s.* extra ; and with double hay frame, 45*s.* extra. There was, undoubtedly, a close competition between this cart and that of Mr. Busby, which gained the premium. Mr. Stratton also exhibited his well known cylindrical liquid manure cart. The body of this cart consists of a wooden barrel, containing 100 gallons, and the chief improvement consists in the substitution of circular wrought-iron ends, strengthened with angle iron, instead of the wooden octagonal ends originally used, and in the adoption of small-sized boards, ploughed, tongued, and fitted together with the greatest nicety, to prevent any chance of springing or breakage at the joints. These cylinder carts have been honoured by the prizes of numerous local societies, and by the high commendations of the judges of implements, in their report at the York meeting of the Royal Agricultural Society. They are exceedingly light and easy of draught, the 100-gallon cart weighing less than 5 cwt. Price 14*l.* 10*s.* —At Stand 4, Mr. Crosskill, of Beverley, exhibited the railways already referred to. He also showed a number of his clod crushers and Norwegian harrows. He received the prize for his waggon, which is made light and strong, to carry as bulky and heavy a load as two horses will draw anywhere, about 3 tons weight ; it is fitted with a simple yet most complete double break, which is acted upon by a hand wheel in front of the waggon, so that a man, when ready to descend a steep hill, may, by turning this hand-wheel while walking beside the horses, place the double break upon both wheels almost instantly, and most effectively. Fitted with a pole and single pair of shafts. Fore wheels 3 feet 6 inches high, and 4 feet 10 inches hind wheels ; with 2½ inch flat tires. Price 29*l.* Without the double break, 26*l.* ; ditto with the double break, 3*l.* extra.



It is a significant mark of this show that so few waggons and so many carts are exhibited ; only 15 of the former to 51 of the latter. Mr. Crosskill's Norwegian harrow, with its rowels on round axles, received the commendations of the judges.

At Stand 5, Messrs. Clayton and Co., of Lincoln, exhibited four portable steam engines, to one of which the second prize offered in this class was awarded. It had a prize of 25*l.* at the Norwich meeting also. It has a tubular boiler of plates 5-16 inch thick, and tube plates ⅛ inch thick, quality best Butterley-made plates, excepting the fire-box and tube plates, which are Lowmoor ; the cylinder is 8½ inches in diameter, and 12 inches stroke ; the crank shaft is made of Lowmoor wrought iron, 2¾ inches in diameter, and makes 115 revolutions per minute ; diameter of fly-wheel, which serves as a driving-pulley, is 5 feet, and weighs 5 cwt. It will occupy about 45 minutes and consumes 50 lbs. of coals to raise steam to a pressure of 45 lbs. upon the square inch ; consumption of coals per hour, 70 lbs. This engine is fitted with improved governor, and the boiler is covered with hair felt, cased over with wood. Price 217*l.* —Stand 6 exhibited specimens and models of Messrs. M'Neill's patent roofing felt.—At Stand 7, Mr. Harding, of Market Drayton, showed the whipple-trees and cultivator which he has for many years exhibited ; the latter a very clumsy contrivance, which has been long superseded.—At 8, Messrs. Hornsby, of Grantham, the most successful exhibitors of the meeting, held their stand. An exceedingly neat mode of steerage for the drill coulters was shown, toothed wheels and rack-work being substituted for the ordinary crank-work which has been hitherto employed for that purpose. Messrs. Hornsby have received 90*l.* worth of prizes, and a silver medal, at this meeting. Their steam engine is pronounced the best in the yard. The prize of 50*l.* was awarded for this engine at York, 1848. This improved portable steam-engine is simple in its construction, fitted with governors, and easy to manage, with tubular boiler, fire-box and smoke box complete, also registered water-heating apparatus. It is particularly well adapted for threshing and other agricultural purposes ; also pumping, circular sawing, pile driving, &c. Thickness of boiler plates as follows : fire-box various, ¼ in., ⅜ in., 7-16ths, and ⅝ in. ; the horizontal part, 5-16ths ; the quality, best charcoal plates. The diameter of cylinder 10 inches ; length of stroke of the piston, 14 inches ; the number of revolutions of crank shaft per minute, 110 ; the crank shaft, 3 inches diameter, of wrought

iron; journals $2\frac{7}{8}$ and $2\frac{3}{4}$ in.; the diameter of fly-wheel, 6 feet; weight of same 7 cwt., which acts as driving pulley. The probable time it will require to generate the steam to 45 lbs. pressure is about 45 minutes; the quantity of fuel it will consume in getting up the steam about 46 lbs.; the consumption of fuel for every hour it is in full work, about 9 lbs. of coal per horse-power. Price 175*l.*—At 9, Mr. Clayton exhibited his double action tile machine, which received the prize for the best in its class. This machine is constructed for hand-working, entirely made of iron, mounted on large carriage-wheels, and very simple of use: it is fitted with two 18-inch cylinders, attached by swing brackets (so that there is no stoppage for filling) and strong wrought-iron shafts, with the cogwork cut out of the solid. This machine, combining both the "vertical and horizontal plans" of working in the one machine, renders that desirable and practical convertibility in its application according to the kind or shaped tiles required to be made, or the nature of the clay, and which in use has proved an important advantage, by having in one machine every facility that is required to make all kinds and shapes, with the greatest extent of scope yet extant, thus rendering this double-action machine complete in itself (without extra mouth-pieces, &c.), and perfectly applicable to the entire manufacture of the tile-yard. The machine, fitted with two 18-inch cylinders attached to the machine by swing brackets, fitted for working vertically (exclusive of dies, gratings, or other fittings), price 25*l.* Horse-shoe tile dies, &c., each 10*s.*; pipe dies, 18*s.*—Messrs. Howard, of Bedford, at Stand 10, exhibited a number of ploughs, receiving prizes for their two-wheeled large implement for deep ploughing, and their Read's subsoil plough, which seems altogether to have supplanted the Deanston swing implement.—Messrs. Williams, of Bedford, divided with Messrs. Howard, of the same town, the prizes for harrows.—The steam-engine exhibited by Messrs. Dean, of Swan-lane, Thames-street, London, was commended by the Judges. Mr. Busby, of Bedale, Yorkshire, has again received the prize for the best horse-hoe; and his one-horse cart was also rewarded by the premium. This cart is constructed without slot, nails, or mortice. The body is made of plain sides bolted together; the form, position, and finish of this body are adapted for farming work. The loose shelvings are soon taken off or put on the cart when required. The wheels are made with oak [raves, 4 feet 6 inches high, tire 4 inches by $\frac{5}{8}$. Price 11*l.*; with harvest shelvings, 2*l.* extra.—At Stand 25, Mr. Samuelson, successor to Mr. Gardner, of Banbury, justly received the prize for the best Turnip cutter. This implement obtained a prize of 5*l.* at the Norwich meeting, 1849. It cuts pieces of $\frac{3}{4}$ inch by $\frac{5}{8}$ for sheep or calves if the fly wheel is turned in one direction, and slices of $5\frac{1}{2}$ inch by $\frac{5}{8}$ for beasts if turned in the opposite direction. Price 5*l.* 10*s.* He also received the silver medal for Anthony's American churn, which has already been noticed in this journal.—At Stand 34, Mr. Holmes, of Norwich, exhibited a broad-cast manure distributor, for guano, nitrate of soda, salt, soot, and any other manure for top-dressing. The deliverers or "cups" are quite flat, and having rappers or cleaners fixed on the spindle, the manure is kept from adhering to them when in a moist state, but when used for dry manure they can be easily removed; it has also moving boards at the front of the box, to pull up or let down, to throw the manure more directly on to the stirrers; the slides can be easily adjusted, up or down, by a lever at the end, by which the manure can be regulated down to the deliverers; the different quantities are varied by gear wheels, and also regulated by the position of the slides; it is fitted with worm and wheel to regulate the box, which is necessary in going up or down hill. It will deposit regularly from 2 to 20 bushels per acre. Price in Norwich, 13*l.* 13*s.* On this point we may refer to two other similar machines, one exhibited by Dr. Newington, which received a silver medal, and another by Mr. Smyth, of Yoxford, the former of which has an oscillating apparatus for shaking the manure out regularly through a longitudinal slit in the bottom of the box, and the other employs a movement similar in effect (though, as it is produced by the continuous one-way revolution of a spiral—not oscillating) for delivering the manure into the cup-box, from which it is thrust out to the ground in the ordinary way.—Mr. Milward, at Stand 35, exhibited a Potato digger, resembling one of which we had long ago received drawings from Colonel le Couteur, of Jersey. This implement contains a beam and handles similar to the common plough, there being a share and the front part of a turn-wrest for, first to raise a furrow about upright, and behind that there are four forks working with a rotary motion, separating the furrow and throwing it abroad. This implement is adapted to ploughing eddishes and bringing the roots to the surface. Price 6*l.* 10*s.* It received the commendation of the judges.—The steam engine exhibited by Messrs. Barrett and Exall, of Reading, was commended by the judges. The liquid manure distributor invented by Mr. Chandler, of Stockton, Wilts, again received the prize in its class. It was exhibited by Messrs. Reeves, of Bratton, near Westbury. This implement was exhibited last year at Norwich, and obtained the prize for liquid manure distributor; it was then combined with a liquid drill, price 30*l.*, but is now, at the suggestion of Colonel Challoner, made as a liquid manure cart, to hold $2\frac{1}{2}$ hogsheads, and will distribute from the smallest quantity to 40 hogsheads per acre; from its construction, the liquid being thrown out by means of a succession of buckets, straws, leaves, and sediment, that is often found in liquid manure, cannot impede its working, as is the case where the liquid has to run through holes. Price 16*l.* A very simple steerage horse hoe was exhibited by Mr. Smith, of Kettering, Northampton. It draws with shafts; the wheels may be expanded or contracted, so as to be kept between the rows of all plants, the steerage of the implement being quite independent of the horse, so that the man may guide it to the greatest nicety. This horse hoe is adapted for hoeing Wheat, Barley, Peas, Beans, Mangold Wurzel, or Turnips, at any given width that may be required. Price, with eight hoes, 4*l.* 10*s.*; with 12 hoes, 5*l.* 10*s.* Remarkably cheap.—Messrs. Smith, of Stamford, received the prize for their hay-maker, and for their heavy scarifier, which is a very powerful instrument, but too heavy.—Mr. Stanley, of Peterborough, exhibited his steaming apparatus, which was rewarded both at York and at Norwich, and again at Exeter,—and his roller mill, which also carried off the prize. It consists of a pair of smooth narrow wheels, one large and the other small. Mr. Ball's, of Bedford, iron plough was deemed the best for light work. The best broadshare for skimming the surface of the land, was exhibited by Mr. Bentall, of Maldon, Essex, who received a prize of 5*l.* for it. The principle of the machine depends on the long projecting point, which takes hold of the land in advance of the cutting edge of the paring teeth. Mr. Cornes, of Barbridge, near Nantwich, who occupied the next stand, again exhibited his three-knifed chaff cutter, which again received the Society's premium. This machine gained a prize of 10*l.* at the Royal Agricultural Society's meeting at Shrewsbury in 1845, at Newcastle-upon-Tyne in 1846, at Northampton in 1847, at York the Society's silver medal in 1848, and at Norwich the prize of 10*l.* in 1849. It is 12 inches in the mouth, $3\frac{1}{2}$ inches thick; it is applicable to hand, horse, water, or steam-power, and makes five different lengths of chaff—one length of 4 inches, for litter. It is fitted up with the safety registered rollers, which regulate the hay or straw before entering the front rollers, whereby the danger of the feeders getting their hands entangled in the hay or straw is entirely avoided, when the machine is driven by steam or horse-power at a great velocity. This implement is much used in cutting green food for cattle. Weight of fly-wheel, 1 cwt.; diameter, 3 feet 4 inches; driven at 180 revolutions per minute. Price, delivered at Barbridge, 14*l.*; if fitted up to cut Gorse, 1*l.* extra.—At Stand 73, Dr. Newington exhibited his ingenious machines, made by Messrs. Dufaur & Co., of 21, Red Lion-square, London. They included several forms of his seed dibbler—both for hand and horse labour, the latter an exceedingly ingenious adaptation of the former to horse-power; a horse cultivator, a subsoil plough, and pulveriser; the manure distributor alluded to, a drop drill for hand and for horse power, and a hand cultivator. Near this was Mr. Fowler's Stand, whose ingenious apparatus for draining by means of the mole plough we have already described.—At Stand 76, Messrs. Garrett, of Saxmundham, exhibited their drills, horse hoes, threshing machines and steam-engines, for all of which they are so highly distinguished. They received the prizes for the drill for general purposes. Prizes were awarded to this drill at Liverpool in 1841, 10*l.*; at Derby in 1843, 30*l.*; at Southampton in 1844, 20*l.* and a medal; and at Northampton in 1847, 15*l.* This drill is suited to all the requirements of a farm, being enabled to deposit corn or seeds with compost, guano, well rotted farm-yard dung, or other manure, either in a moist or dry state, at any intervals apart. The most recent improvements in its construction consists—1st, in the application of a screw at one end of the box, worked by a pair of mitre wheels and crank handle from behind the drill, by means of which the position of the box may be altered as required to suit the slope of side hills, thereby preventing the inconvenience oftentimes resulting from the manure and seed being drifted to one side and overfilling one end, while the other is comparatively empty; 2dly, in the application of two slides to the two departments of the manure box (instead of the patent slide all in one, hitherto used), which are regulated from behind the drill, and possesses the advantage of allowing the quantity of manure to be altered as required in one department without affecting the manure in the other; 3dly, in making the slides which cover the opening of the corn box, through which the seed is delivered to the cups, to affix to an iron bar, which extends the width of the box, and being acted on by a lever from behind, allows the whole of the slides to be raised or lowered at once, to admit larger or smaller quantities of seed to the cups as required. Price 35*l.* 12*s.* 6*d.* Premiums were also awarded to them for their drop drill—their seven-row box corn drill, their hand seed drill, and their horse hoe. Their steam-engine was highly commended. The first prize of 50*l.* was given for this engine at the Norwich meeting in 1849. This engine, at the pressure of steam limited by the rules of the [Society, will work up to six horse power, and is adapted for driving agricultural machinery, such as threshing, dressing, grinding, and cutting machines; pumping water, sawing, and other stationary work on a farm, and being very simple in construction the management may readily be understood by any intelligent farm labourer. It is mounted on four strong carriage wheels, and the whole weighing only 50 cwt. renders it easy of conveyance from place to place, and only a fair load for two horses. It is made with a tubular boiler; the thickness of the fire box is $\frac{3}{8}$ and $\frac{1}{2}$ inch, smoke box 5-16ths and $\frac{1}{4}$ inch, shell 5-16ths inch, and quality best Staffordshire iron; the diameter of cylinder $7\frac{1}{2}$ inches; length of stroke 12 inches; the crank shaft makes 100 to 120 revolutions per minute, and is $2\frac{3}{4}$ inches diameter, forged from best faggoted iron; the diameter of fly wheel is $61\frac{1}{2}$ inches, and weight $4\frac{1}{2}$ cwt., the same answering for the driving pulley. It will take 40 minutes, and consume 30 lbs. of coal, to raise the steam to a pressure of 45 lbs. per square inch, and the consumption of fuel, when working at six horse power, $6\frac{1}{2}$ lbs. per horse per hour. Price 205*l.*—At 84, Messrs. Hill, of Dudley, exhibited their wrought iron horse-hoe, and received for it a silver medal. A small Norwegian harrow works behind the hoes, which not only has the effect of steadying the implement when at work, but is also very effective in bringing weeds, &c. to the surface. Price 2*l.* 10*s.*—Mr. Lowcock, of Collumpton, at 87, carried off the prize for the best turnwrest plough; the plough does not turn at the ends, but the ploughman having completed his furrow to the right, passing on the furrow side of the plough, turns over the handles from one end of the beam to the other, where they are re-adjusted by a spring-catch affixed to them, which, dropping into a mortice at the beam head, renders them immoveable. Whilst performing this simple operation, the horses turn round on the land side of the plough, thus preventing the ploughed land from being trodden; and by the act of turning, the draught chain, to which they are attached, slides on a rod to the other end of the plough. As soon as the horses commence drawing, the left-hand share and coulter drop into their work; the double fly, which forms part of the mould plate, each way coming in contact with the newly-cut furrows, instantly turns round, and assumes its correct position, when the implement proceeds without further adjustment, cutting out and turning over its furrow to the left.—At 92, Mr. Nicholson, of Newark-upon-Trent, received a prize of 5*l.* for the best oil-cake bruiser; and another prize of 5*l.* for the best cottage range. This article had a prize of 5*l.* awarded to it at the York Show. A compact and convenient-looking range, similar in outline to those usually made, with the following important improvements: viz.—1st, a fire-brick lining to the fire part; 2d, an improved form of fire, allowing a greater radiation of heat with less fuel; 3d, a new form of range, holding the fuel till all is consumed, and sliding in grooves, so that the remains of a fire can be cleaned out in an instant, whilst the top bar is conveniently contrived to fall both ways; 4th, improvement in the fitting and position of the door of oven, the boiler cover, the flues, and general fitting. Prices:—for 3 ft. 4 in. opening, 2*l.* 2*s.*; smaller, for 3 ft. 2 in. opening, 1*l.* 15*s.*; larger, for 3 ft. 8 in. opening, 2*l.* 10*s.* Mr. Nicholson also received the silver medal for a cottage stove.

The above are the chief points in the exhibition requiring notice. We cannot conclude without referring to the admirably arranged catalogue, the merit of which is due to Mr. Gibbs, who has long held the position of honorary director of the Show. If the different exhibitors were to confine themselves strictly to a description of their machines, without offering any opinion on their merits, leaving those to be found out by the visitors, it would, perhaps, be an improvement. Not that this is a rule generally departed from, but the exceptions to it might be advantageously avoided altogether. The fuller in point of description that they are, of course so much the better for the reader. And we can hardly imagine a more perfect library on the subject of agricultural mechanics, than a series of those annual volumes would, under these circumstances, ultimately prove.

WEDNESDAY, *July* 17.—PROFESSOR SIMONDS'S LECTURE ON THE DISEASES, &C. OF THE LIVER.—A whole city brilliant with flags and gaudy banners, triumphant with garlands and arches, and resounding with festivities,—this exhibits many minor indications of the growing success attending the Society's annual gathering. But not the least among the signs of prosperity is the fact that the Athenæum Lecture Room was filled on Wednesday with attentive listeners whilst Professor Simonds delivered his lecture on the Structure, Functions, and Diseases of the Liver in domesticated animals. Let us hope that the attendance was a *bona fide* indication of a desire among the farmers to hear from the lips of scientific men explanations of facts observed in common farm practice, and suggestions for remedying diseases commonly thought incurable; and let us hope that the announcement of the awards at the close was not the principal attraction. Doors were opened at half-past 5, and the President, the Marquis of Downshire, having taken the Chair, the learned lecturer proceeded somewhat as follows: The liver is one of the most important of the internal organs, as it separates injurious matter from the blood. Food entering into the stomach is digested; it then passes into the intestinal canal, where it is mixed with the bile and pancreatic juice; and it is by the combined action of these fluids upon the chymous mass that its change into nutriment is effected. As to the anatomy of the liver: It is one of the largest organs, and is denominated a *gland*, because it separates fluid from the blood. In one important respect, however, it differs from all other glands, viz., in separating the fluid from impure or venous blood. The liver of animals differs in size without reference to their bulk, that of herbivorous animals being generally the smallest. The human frame has several large cavities, each containing important parts of the viscera; thus, the heart is in the chest—the stomach, &c., in the abdomen, which is divided from the chest by a membrane termed the diaphragm. Anatomists divide the abdomen into regions, by means of two transverse lines drawn from the inferior rib to its opposite, and from hip to hip; and also by two vertical lines. The whole arrangement may be figured thus, and the spaces are named as follows: 1, right hypochondriac region; 2, left do.; 3, epigastric; 4, umbilical; 5, right lumbar; 6, left do.; 7, hypogastric; 8, right iliac; 9, left iliac. The hypochondriac regions are so named because they lie beneath the cartilage of the ribs. The umbilical, because it contains the navel. The epigastric, because it is above the stomach. The hypogastric, because it is under the stomach. The liver is situated in the middle one of the three great regions, termed upper, middle, and lower; sometimes stretching up into the epigastric region. It is

divided into lobes. In horses it consists of a right and left lobe, with a *lobus cistatus*, or notched lobed, in the centre. In the ox and sheep, the notches are absent, and there are three lobes—right, left, and middle. In some animals there is an appendage called the gall bladder; but the horse has none. Its absence is not confined to any particular tribe, as it is found in some of the deer tribe, and not in others. This receives secretion from the liver; but is not necessary to the life of animals, as horses and some other species do without. The liver being a secreting gland, and receiving much impure blood, has veins from nearly all the organs entering into it. The anterior and posterior mesenteric veins (from the large and small intestines), and the splenetic, pancreatic, and gastric veins (from the spleen, pancreas, and stomach), combine to form the vena portæ, which conveys the blood into the middle lobe of the liver. Thus, there is a constant conveyance into this organ of matters in the blood which are not essential to the general well-being, but only to the heat of the animal. The vena portæ comports itself like an artery, *i.e.*, it splits up into a number of veins so minute as to be named capillaries, which traverse the liver in every part; and it is in these that secretion takes place. The liver is also excretory. For in fœtal life in some animals it receives the whole of the blood before it passes into the fœtus. The veins pass through the portal canal, which is lined with cellular tissue. The veins, biliary ducts, and arteries lie in a triple form thus: ° ° ° with cellular tissue upon them; an arrangement which the lecturer very aptly illustrated by a reference to three drain-pipes in a trench bedded down with straw. The various vessels split up into lobules, the veins and ducts being named intra-lobular, inter-lobular, &c, according as they are within or between the lobules. So much for the anatomy.—The blood is purified by the bile which is secreted in the biliary ducts, the latter liquid exerting an influence upon the ligneous and starchy portions of the food, converting them into sugar; and this being soluble is suitable for nourishing the system. Within a few months past, experiments have been undertaken in this and other countries to ascertain what is the precise action of the pancreas and liver; and it has been found that although the pancreas chiefly is engaged in forming sugar, yet the liver also does the same; and thus it has been shown, in opposition to Liebig and others, that an animal is capable of generating a chemical principle, viz., sugar. The bile cells contain fat, and the liver has much sugar, from which fat is derived, there being a new light thrown upon the formation of fat in animals by this modern theory. Bile not only acts upon the food, but is also excrementitious. The colouring matter of the bile is found in the intestinal canal; and if there be too much here, the effect is diarrhœa. Having briefly touched upon the physiology, we now come to the diseases of the liver. This organ, like all others, is liable to derangement and structural changes. Its functions are very soon deranged, especially by placing the animal in a high temperature. Hence, in tropical climates liver diseases abound, and animals are peculiarly subject to such maladies during the summer. Now, there is one disease of the liver called jaundice, which depends often on functional derangement, sometimes upon structural changes, or obstruction; in fact there are three or four causes for it. This shows the necessity of consulting some individual who has made such things his study, and who is able to detect each of these causes. Whereas, to the unpractised, the effects of all these may appear alike. If the character of the secretions depend upon the purity of the blood, and if this again depend on the nature of the food, then, as is the food, so will be the bile; and from the wrong quality of the food, &c., the bile may become thickened, may run together; and thus we have calculi both in the ducts and in the gall bladder. Here then comes the question, if an animal is affected in this manner, is it from gall-stones or not? If so, there may be little danger; but if the calculus be in the biliary duct great harm will result, for in the former case there is no obstruction to the flow of the bile; in the latter there is. This is of more importance in the sheep than in the ox; for in the former the pancreatic duct joins with the biliary duct before entering the intestinal canal. A calculus in the biliary duct hinders the passage of that which forms nutriment; and, as when the liver secretes too much bile it runs into the membranes, &c., of the body, the calculus sends it in the same direction. It likewise affects the urinary secretions; but when gall-stones cause jaundice, there is no diarrhœa, and the urine is not rendered brown. A practiced man, therefore, would distinguish, by these and other symptoms, between the different sources of the disease. Now, as to treatment: If the cause is inflammation, get rid of the constipation in the bowels by aperient medicine, and there may be also an application of counter-irritants to the side. A gall-stone requires a different mode of treatment. We must get rid of the mechanical obstruction—we must excite the ducts to throw off more bile, so as to drive it away. These remarks lay the foundation for a few observations upon the rot in sheep. No disease has received so much attention; and it is most important to the farmer that we should enquire into its nature. Rot depends in a great measure upon the quality and kind of food with which sheep are fed, some pastures being notorious for it, others entirely free. As a broad principle it may be stated that when there is an excess of moisture, the food is prejudicial to the animal. This malady is not peculiar to this country but prevails over Europe and Asia, and in Egypt after the Nile waters have subsided; showing that the cause is not in the soil, nor in the temperature, since it occurs upon any soil and with any temperature. Perhaps there is more than one cause. Is there any particular period of the year during which it is most prevalent? We should say that it is from this time to the autumn. If a large quantity of rain were now to fall, there would be a luxuriant herbage, but that would be deficient in nutriment, and a great amount of moisture would be taken into the system of the animals which ate it. We have said that in the first stages of the disease there is a considerable accumulation of fat. Now, sheep put on to water-meadows at this season are almost sure to have the rot; and as this directly induces fatness, sheep have been fed in this way for the market. [The Marquis of Downshire here communicated a statement to the effect that the way to fatten sheep was to flood the meadows they were on with water 2 inches deep, and keep it there.] The bile next loses its properties of supplying nutrifying matter. The blood consequently becomes impure all over the system, for the same reason that pure water is never obtained from a poisoned fountain. We must now advert to those parasites of the liver called flukes, which in the gall ducts produce the effect of a structural change. Some think that these oviporous animals are the origin of rot. The feculent matter of rotten sheep contains millions of ova of the flukes, and just as an egg will keep for any length of time until heat is applied and the chick hatched, so these ova, while on the pastures undergo no change; but in their natural habitat, the body of the animal, they quickly develope themselves. Wheat, in the same way, has been locked up in mummies for thousands of years, and then being sown produced plants. Youatt, in his work on sheep, treating of the anatomy of the fluke, describes organs which do not exist. What he calls the "eye," is a sucking disc by which the animal adheres to the liver. Flukes are bisexile or hermaphrodites. They have another disc at one extremity of the body, by some supposed a mouth; but if not, their nutriment (viz. bile), must be imbibed by the whole surface of the body. When placed dead in warm water they will swell very much, which seems to indicate a considerable absorbing power. In conclusion, as to the principles that should guide us in the treatment of rotting sheep. Two years ago seven or eight sheep, each showing the rot in its advanced stages, were put in a shed and supplied with dry and nutritious food; two were cured, the liver being still affected, but so little that they might have lived for years. Rot is a disease analogous to dropsy. It arises from impure blood, that blood being rendered nutritious by the water it contains, and the water penetrates into the cellular tissue, between the jaws, &c. This has led writers into "sections" of this disease; but "water-rot" and "fluke rot" are only less or more advanced stages of one disease. If flukes exist we must strike at the root, get rid of the animalcules, and we must do this by bringing about a healthy condition of the animal, since no medicine will act directly upon the flukes. Many persons advocate the use of salt, it being a stimulant to the digestive organs. Some people keep it in troughs for their sheep to help themselves to; and it is certainly an excellent preventive. We know that it matters not how moist salt marshes are, for rot will not attack flocks there. But can we not do better? Salt has an injurious effect upon the stomach. We should throw tonics into the system. Mineral tonics are the best, and sulphate of iron gives the greatest tone. We have said that the kidneys now do what the liver ought to have done, and we should therefore stimulate them to greater action. We do not mean to recommend the exhibition of ordinary diuretic agents, because they produce debility; but the spirit of nitric ether, which is a good medicine. We ought, then, to husband the animal's powers by placing him in a proper situation, dry, &c.; supply him with nutritious and dry food; we should mix it with salt, and we should administer small quantities of sulphate of iron and nitric ether. We have no doubt that the farmer, by attention to these points, would often have to rejoice that he had not sent his sheep to the knacker, but to the butcher.

Mr. Brandreth having proposed a vote of thanks to the learned and lucid lecturer, the Marquis of Downshire thanked Professor Simonds on behalf of the meeting. Mr. Gibbs then read the awards of the judges of stock. Much interest was evinced during the lecture, the cheers rising highest whenever a fact was stated such as the flockmasters present knew to be correct.

THURSDAY, *July* 18.—The doors of the cattle yard were opened at 6 o'clock this morning, and those who wished to have a satisfactory examination of the animals soon after entered. The sheds soon became inconveniently crowded, though not, we think, to such an extent as on previous occasions. The following is the list of prizes awarded for cattle, sheep, and pigs:

SHORT-HORNS.

Judges.—Messrs. WILLIAM COX, WILLIAM SMITH, WILLIAM BARTHOLOMEW.

Class I. Bulls calved previously to the 1st of January, 1848.—1st prize, 40*l.* to Mr. Henry Ambler, of Watkinson Hall, near Halifax; 2d, 20*l.* to Mr. John F. P. Phillips, of Broomborough, near Totnes.

Class II. Bulls calved since the 1st of January, 1848, and more than one year old.—1st prize, 20*l.* to Mr. Richard Booth, of Warlaby, near Northallerton; 2d, 10*l.* to Mr. Charles Towneley, of Towneley Park, near Burnley.

Class III. Cows in milk or in calf.—1st prize, 20*l.* to Mr. Richard Booth, of Warlaby, near Northallerton; 2d, 10*l.* to the same.

Class IV. In-calf heifers, not exceeding three years old.—1st prize, 20*l.* to Mr. Benjamin Wilson, of Brawith, near Thirsk; 2d, 10*l.* to Mr. John M. Hopper, of Newham Grange, Middlesborough-on-Tees.

Class V. Yearling heifers.—1st prize, 10*l.* to Mr. Charles Towneley, of Towneley Park, near Burnley; 2d, 5*l.* to the same.

HEREFORDS.

Judges.—Messrs. HENRY CHAMBERLAIN, JOHN THOMAS, HENRY TRETHEWY.

Class I. Bulls calved previously to the 1st of January, 1848.—1st prize, 40*l.* to Mr. John Monkhouse, of the Stow, Hereford; 2d, 20*l.* to Mr. John Walker, of Westfield House, Holmer, Hereford.

Class II. Bulls calved since the 1st of January, 1848, and more than one year old.—1st prize, 20*l.* to Mr. W. Perry, of Cholstrey, near Leominster; 2d, 10*l.* to Mr. James Walker, of Northleach, Gloucester.

Class III. Cows in milk or in calf.—1st prize, 20*l.* to Mr. J. N. Carpenter, of Eardisland, near Leominster.; 2d, 10*l.* No animal exhibited.

Class IV. In-calf heifers, not exceeding three years old.—1st prize, 20*l.* to the Right Hon. Lord Berwick, of Cronkhill, near Shrewsbury; 2d, 10*l.* to Mr. George Pitt, of Wellington, near Hereford.

Class V. Yearling heifers.—1st prize, 10*l.*, to the Right Hon. Lord Berwick, of Cronkhill, near Shrewsbury.

DEVONS.

Judges.—Messrs. EMANUEL PESTER, THOMAS TOWNSEND, and T. HARTSHORNE.

Class I. Bulls calved previously to the 1st of January, 1848.—1st prize, 40*l.*, to Mr. George Turner, of Barton, near Exeter; 2d, 20*l.*, to Mr. John Passmore, of Bishopsnympton, near Southmolton.

Class II. Bulls calved since the 1st January, 1848, and more than one year old.—1st prize, 20*l.*, to Mr. James Quartly, of Molland, near Southmolton; 2d, 10*l.*, to Mr. John Quartly, of Champson, Molland, near Southmolton.

Class III. Cows in milk or in calf.—1st prize, 20*l.*, to Mr. James Quartly, of Molland, near Southmolton; 2d, 10*l.*, to the same.

Class IV. In-calf Heifers, not exceeding three years old.—1st prize, 20*l.*, to Mr. James Quartly, of Molland, near Southmolton; 2d, 10*l.*, to Mr. W. M. Gibbs, of Bishop's-Lydeard, near Taunton.

Class V. Yearling Heifers.—1st prize, 10*l.*, to Mr. John Quartly, of Champson, Molland, near Southmolton; 2d, 5*l.*, to Mr. James Quartly, of Molland, near Southmolton.

CATTLE OF ANY BREED.

Not qualified to compete as Short-horns, Herefords, or Devons. (Cross-bred excluded.)

Judges.—Messrs. HENRY CHAMBERLAIN, JOHN THOMAS, and HENRY TRETHEWY.

Class I. Bulls calved previously to the 1st January, 1848.—1st prize, 20*l.*, to Mr. Richard H. Chapman, of Upton, near Atherstone; 2d, 10*l.*, to Mr. James Gorringe, of Tilton Farm, Selmeston, near Lewes.

Class II. Bulls calved since the 1st January, 1848, and more than one year old.—The prize of 10*l.* No animal exhibited.

Class III. Cows in milk or in calf.—1st prize, 10*l.*, to Mr. James Gorringe, of Tilton Farm, Selmeston, near Lewes; 2d, 5*l.*, to Mr. N. Le Beir, of the Castel Parish, near St. Peter's Port, Guernsey.

Class IV. In-calf Heifers, not exceeding three years old.—The prize of 10*l.*, to Mr. Thomas Beards, of Stowe, near Buckingham.

Class V. Yearling Heifers.—The prize of 5*l.*, to Mr. Thomas Beards, of Stowe, near Buckingham.

HORSES.

Judges.—Messrs W. C. SPOONER, W. F. KARKEEK, and CHARLES BOWMAN.

Class I. Stallions for agricultural purposes, of any age.—1st prize, 30*l.*, to Mr. Thomas Beale Brown, of Hampden, near Andoversford, Gloucester; 2d, 15*l.*, to Mr. N. G. Barthropp, of Cretingham Rookery, near Woodbridge, Suffolk.

Class II. Two years old Stallions for agricultural purposes.—1st prize, 20*l.*, to Mr. F. T. Bryan, of Knossington, near Oakham; 2d, 10*l.*, to Mr. David Wright, of Hepworth, near Ixworth, Suffolk.

Class III. Roadster Stallions.—The prize of 15*l.* to Mr. Charles Poulton, of 7, Sidney-terrace, Reading.

Class IV. Mares and Foals for agricultural purposes.—1st prize, 20*l.*, to Mr. John Ward, of East Mersea, near Colchester; 2d, 10*l.*, to Mr. N. G. Barthropp, of Cretingham Rookery, near Woodbridge, Suffolk.

Class V. Two years old Fillies.—1st prize, 15*l.*, to Mr. N. G. Barthropp, of Cretingham Rookery, near Woodbridge, Suffolk; 2d, 10*l.*, to Mr. William Fisher Hobbs, of Boxtead Lodge, near Colchester.

LEICESTER SHEEP.

Judges.—Messrs. WILLIAM TOBB, VALENTINE BARFORD, and JOHN HALL.

Class I. Shearling Rams.—1st prize, 30*l.*, to Mr. William Abraham, of Barnetby-le-Wold, near Brigg, Lincoln; 2d, 15*l.*, to Mr. William Sanday, of Holme Pierrepoint, Nottingham.

Class II. Rams of any other age.—1st prize, 30*l.*, to Mr. William Abraham, of Barnetby-le-Wold, near Brigg, Lincoln; 2d, 15*l.*, to Mr. William Sanday, of Holme Pierrepoint, Nottingham.

Class III. Pens of five Shearling Ewes of the same Flock.—1st prize, 20*l.*, to Mr. William Abraham, of Barnetby-le-Wold, near Brigg, Lincoln; 2d, 10*l.*, to Mr. William Sanday, of Holme Pierrepoint, Nottingham.

SOUTHDOWN, OR OTHER SHORT-WOOLLED SHEEP.

Judges.—Messrs. ROBERT OVERMAN, EDWARD TRUMPER, and L. P. MATON.

Class I. Shearling Rams.—1st prize, 30*l.*, to Mr. William Sainsbury, of West Lavington, near Devizes; 2d, 15*l.*, to the same.

Class II. Rams of any other age.—1st prize, 30*l.*, to Mr. William Rigden, of Hove, near Brighton; 2d, 15*l.*, to Mr. William Sainsbury, of West Lavington, near Devizes.

Class III. Pens of 5 Shearling Ewes of the same Flock.—1st prize, 20*l.*, to Mr. William Rigden, of Hove, near Brighton; 2d, 10*l.*, to his Grace the Duke of Richmond, of Goodwood, Chichester.

LONG-WOOLLED SHEEP.

Not qualified to compete as Leicesters.

Judges.—Messrs. ROBERT BEMAN, WM. GILLETT, and EDWARD CLARKE.

Class I. Shearling Rams.—1st prize, 20*l.*, to Mr. George Hewer, of Ley Gore, near Northleach; 2d, 10*l.*, to Mr. William Garne, of Aldesworth, near Northleach.

Class II. Rams of any other age.—1st prize, 20*l.*, to Mr. William Garne, of Aldsworth, near Northleach; 2d, 10*l.*, to Mr. William Lane, of Eashington, near Northleach.

Class III. Pens of 5 Shearling Ewes of the same Flock.—1st prize, 10*l.*, to Mr. Charles Large, of Broadwell, near Lechlade, Gloucester; 2d, 5*l.*, to the same.

PIGS.

Judges.—Messrs. JOHN CLAYDEN, JOHN HANNAM, and WILLIAM BULLEN.

Class I. Boars of a large breed.—1st prize, 15*l.*, to Mr. Moses Cartwright, of Stanton-hill, near Burton-on-Trent; 2d, 5*l.*, to Mr. John H. Ley, of Trehill, near Exeter.

Class II. Boars of a small breed.—1st prize, 15*l.*, to Mr. John Bartlett, of Lifton, near Launceston; 2d, 5*l.*, to John Radmore, of Thorverton, near Collumpton.

Class III. Breeding Sows of a large breed.—The prize of 10*l.* to Mr. George Tuley, of Ecley Head, near Keighly, Yorkshire.

Class IV. Breeding Sows of a small breed.—The prize of 10*l.* to Mr. Wm. Northey, of Lifton, near Launceston.

*** The judges consider the competition in Class IV. for Sows of a small breed to be almost unprecedented.

Class V. Pen of Breeding Sow Pigs of a large breed.—The prize of 10*l.* to Mr. Moses Cartwright, of Stanton-hill, near Burton-on-Trent.

Class VI. Breeding Sow Pigs of a small breed.—The prize of 10*l.* to Mr. George Turner, of Barton, near Exeter.

LOCAL PRIZES.—SOUTH-HAMS CATTLE.

Judges.—Messrs. EMANUEL PESTER, THOMAS TOWNSEND, and T. HARTSHORNE.

Class I. Bulls calved previously to the 1st January, 1848.—1st prize, 20*l.*, to Mr. Philip Loye, jun., of Stokenham, near Kingsbridge, Devon; 2d, 10*l.*, to Mr. Nicholas Pitts, of South Allington, near Kingsbridge.

Class II. Bulls calved since the 1st January, 1848.—1st prize, 10*l.*, no animal exhibited; 2d, 5*l.*, ditto.

Class III. Cows in calf or in milk, having produced a living calf within the previous 12 months.—1st prize, 15*l.*, to Mr. R. H. Watson, of Dorseley Farm, near Totnes; 2d, 5*l.*, to the same.

Class IV. In-calf Heifers, not more than three years old.—1st prize, 15*l.*, no animal exhibited; 2d, 5*l.*, ditto.

Class V. Yearling Heifers.—1st prize, 10*l.*, not sufficient merit; 2d, 5*l.*, ditto.

COMMENDATIONS.

SHORT-HORNS.—Class 3, Generally commended. Class 4, The Judges highly commend Lord Feversham's Heifer, Mr. Kirkham's Heifer, Mr. R. Stratton's Heifer, Mr. Towneley's Heifer, Mr. B. Wilson's Heifer. The Class generally commended.

HEREFORDS.—Class 1. Commended Mr. W. O. Bigg's Bull. Class 2. Generally commended. Class 4. Commended Mr. Craddock's Heifer; commended Mr. George Pitts' Heifer.

DEVONS.—Class 1. Highly commended Mr. Thomas Miller's Bull. Class 2. Very highly commended Mr. T. B. Morle's Bull. The class generally commended. Class 3. Very highly commended Mr. James Quartly's Cow. Class 4. Very highly commended Mr. J. K. Farthing's Cow and Mr. James Quartly's Heifer. Class 5. Generally very highly commended.

HORSES.—Class 1. Highly commended Mr. H. Matthews' Stallion; commended Mr. Thomas Renton's Stallion, Messrs. S. and R. Spencer's Stallion, and Mr. W. Sherley's Stallion. Class 2. Commended Mr. N. G. Barthropp's Stallion. Class 3. Highly commended Mr. W. Gile's Stallion; commended Mr. Job White's Stallion. Class 4. Commended The Right Hon. Lord St. John's Mare and Foal; highly commended Mr. Edmund Wilcox's Mare and Foal. Class 5. Commended Mr. N. G. Barthropp's Filly; highly commended Mr. W. Fisher Hobbs' Filly. The Class generally commended.

LEICESTERS.—Class 3. Commended Mr. Wm. Sanday's Pen of Ewes.

SOUTH-DOWNS.—Class 1. Commended Mr. Wm. Sainsbury's Ram. Class 2. Commended Mr. Wm. Sainsbury's Ram. Class 3. Commended Mr. Shelley's Pen of Ewes.

LONG WOOLS.—Class 1. Highly commended Mr. Geo. Hewer's Ram; commended Mr. Charles Large's Ram. Class 2. Commended Mr. William Garne's Ram; highly commended Mr. William Lane's Ram.

PIGS.—Class 1. Commended Mr. R. Kinneir's Boar; highly commended Mr. Mark Stainsby's Boar. Class 2. Commended Mr. J. T. Davy's Boar; commended Mr. John Hole's Boar. Class 2. Commended Mr. Jas. Hardwick's Boar and Mr. Wm. Fisher Hobbs' Boars; highly commended Mr. H. L. Maw's Boar, Mr. John Savery's Boar, and Mr. Joseph Tuley's Boar. Class 3. Highly commended Mr. Moses Cartwright's Sows; commended Mr. J. A. Thomas' Sow. Class 4. Commended Mr. Wm. Balls' Sow; highly commended Mr. Richard Bartlett's Sow; commended Mr. Frederick Barlow's Sow, Mr. J. T. Davy's Sow, and Mr. Richard Mogridge's Sow; highly commended Mr. John Moon's Sow and Mr. J. F. P. Philips' Sow; commended the Right Hon. the Earl of Radnor's Sow; highly commended Mr. John Savery's Sow, Mr. Mark Stainsby's Sow, Mr. John Wippell's Sow, and Mr. Joseph Tuley's Sow. Class 5. Commended Mr. Joseph Tuley's Three Breeding Sows; highly commended Mr. G. D. Trotter's pen of Breeding Sows. Class 6. Commended Mr. W. M. Barber's three Breeding Sows; highly commended Mr. John Catherall's three Breeding Sow Pig; commended Mr. W. Fisher Hobbs' three Breeding Sow Pigs.

EXTRA STOCK.—Highly commended Mr. Chas. Towneley's Heifer, Mr. G. Coombe's pen of Ewes, and Mr. Mark Stainsby's pen of Pigs.

B. T. BRANDRETH GIBBS, Honorary Director of the Show.

The exhibition of cattle was, as might have been expected, remarkable chiefly for the show of Devon stock, which, in most of the classes, was very highly and justly commended by the Judges. But on this department of the show, and on the exhibition of horses, we are bound to postpone our report. The following remarks refer to the show of sheep.

The total number of SHEEP exhibited is less than last year, the principal deficit being in the Leicester, which the considerable increase in the number of Southdowns does not counterbalance. Leicesters, Class 1, shearling rams, the prize of 30*l.* has been awarded to No. 290, a 16 months old ram, belonging to Mr. William Abraham, of Barnetby-le-Wold, near Brigg, Lincolnshire. This sheep is remarkably wide, possessing a full breast, good plates, small head, and very firm handling. The neck is short, with plenty of mutton upon it. There is a fair quantity of good curly wool. The prize of 15*l.* was awarded to No. 309, a 16 months old ram, belonging to Mr. W. Sanday, of Holme Pierrepoint, near Nottingham. The frame is small, but the back is straight, the ribs springing wide from the chine, the neck thick and short, the breast wide and deep, the head very fine, bone thin; the rump and loin are good; meat firm, and wool good both in quality and quantity. No. 292, a Leicester from Devonshire; has a deficient fore-quarter, long thin scrag, and a rather coarse head. No. 298, from the same county, is long and high-standing, but has no depth of carcass, and thins off too much towards the rump. No. 299, belonging to the same owner, is far from being a good animal, the fore-quarter being narrow and confined, and the neck thin and tapering. Among Mr. Pawlett's sheep we noticed 304, which has a good straight back, a wide and full rump, chine and plate well filled out; it is, altogether, a very symmetrical animal, possessing fine bone and excellent quality. No. 310 is larger than the second prize sheep, but has a narrower chine, the mutton is firm and good; 317 and 318, from Yorkshire, are small sheep, having no especial points of beauty.—Class II. Rams of any age. The prize of 30*l.* was given to No. 323, Mr. Abraham's ram, aged 28 months. He has great size, very firm meat, amazing breadth of carcass, a full deep wide breast and fore-quarter, fine offal, and a good countenance; being altogether a paragon of excellence, but certainly in very good condition; 330, a sheep from Yorkshire, is a good-rumped, full-plated animal, round and full like an egg, but not fine enough in quality, the handling not being so good as that of the prize sheep. This and other animals were well fed, and it is certain that "breeding often goes in at the mouth;" perhaps with the animals less fat we have a better opportunity of seeing their defective points. The prize of 15*l.* was given to 342, Mr. Sanday's sheep, 28 months old. It has a good back, very wide deep plates, and an exceedingly good breast. It is very compact, but not overloaded with fat. The mutton is firm, the fleece a curly thick-set staple. Perhaps its defect is a high loin; 333, Mr. Hobbs' ram, 40 months old, is good in most points, and very compact; 337, Mr. Pawlett's ram is wide, good, straight, of fine quality, and firm handling; 343, Mr. Sanday's 28 months old, has a splendid handling, being also good in shape all over; the neck is not separated from the shoulder, but completes the oval form that a Leicester should possess; it has a pretty head and fine offal; perhaps a falling off in the plate and breast may have hindered it from taking the second prize.—Class III. Shearling Ewes. The prize of 20*l.* was awarded to Mr. Abraham's pen, No. 355, large, wide, heavy, beautifully compact ewes, some of them complete patterns of the Leicester breed; one or two a little failing in the flank; they have fine delicate heads and ears, but the wool is rather too close, like that of Southdown. The prize of 10*l.* was given to No. 364, Mr. Sanday's ewes, pretty little sheep, with small heads and fine bone, a fair quantity of wool; the handling of some rather loose. No. 363, the property of the same breeder, were commended, and deservedly so, having good form, good rumps, good backs, fine offal, and good curly wool. One of the best pens was 365, belonging to Mr. Simpson, of Yorkshire. These ewes are very large and well-proportioned, resembling in form and dimensions some of the shearling rams; they have good fleeces, but perhaps their main deficiency is in the rump. The ewes shown out of Devonshire were generally straight, tall, big, the necks too long and lean, the fleece light, and the handling loose. —Southdowns, and other short-woolled sheep, Class I. Here we were particularly struck with the appearance of No. 407, Mr. James Webb's ram, 17 months old; it was straight, round, beautifully filled out in every part, having a broad back from the neck to the rump, a fine head, excellent handling, and very fine wool. The prize of 30*l.* was assigned to 394, Mr. W. Sainsbury's ram, of Wiltshire; it is of beautiful shape, straight, round, with a good rump, but it has not so wide a chine, so good a neck, or so regular a shape as the sheep just mentioned. The prize of 15*l.* was awarded to No. 393, Mr. Sainsbury's ram, a beautiful animal, but not equal to some others in the class. No. 395, belonging to the same breeder, was commended, being of good form and quality. One of Mr. Webb's sheep (No. 405) is remarkably heavy and wide, somewhat resembling a Leicester with a Down fleece. The mutton is of good quality—the chine, breast, rump, loin, leg,—all excellent; altogether it is an astonishing animal for 17 months of age. No. 376, a sheep from Berkshire, is coarse and badly shaped, cutting a very poor figure beside its neighbours. Mr. Webb's generally exhibited great compactness of form, good backs, shoulders, necks, and legs, having wide fore-quarters, and wool of fine quality. No. 387, from Devonshire, is about half the width it ought to be, being very lank, and having no breadth or depth of chest, and yet thick clumsy bone.—Class II. Rams of any other age. The prize of 30*l.* was given to No. 432, Mr. W. Rigden's ram, of Sussex; it is 52 months old, having a fine wide deep chest, rib springing well from the chine, excellent rump, and good legs,—beautiful mutton and fine offal; perhaps it is a little too low in the middle of the back. The prize of 15*l.* was awarded to No. 436, Mr. Sainsbury's ram, aged 20 months: it has a very good rump and thick neck, very superior in many points; 438, Mr. Sainsbury's ram, is commended; 435, Mr. Shelley's ram, 40 months old, is a good animal, having a remarkably good neck, *i.e.* scarcely any at all. The chine, however, is deficient; 430, another sheep from Devonshire, is a poor animal,—it has a long thin neck, a narrow sunk chine, an uneven back, and a low rump, and it carries but little meat. The Messrs. Ellman of Sussex exhibited some thick-necked, wide-shouldered, good-rumped sheep, with good backs and sufficient wool.—Class III. Shearling ewes. The prize of 20*l.* was awarded to 446, the ewes of Mr. Rigden, Sussex. They are almost perfect animals, being of wonderful breadth behind the shoulder, and having good rumps, necks, heads, and backs. The prize of 30*l.* was obtained by his Grace the Duke of Richmond, for five beautiful ewes, long, wide, well filled out, of good quality both in meat and wool. No. 447, Mr. Shelley's ewes, commended, were equal to either of the prize lots in beauty of form, handling, and wool, but there were one or two deficiencies in the necks. — Long-wools, Class I. In these classes the judgment becomes bewildered, each sheep being a giant of its species, and each one a study for breeders. We must, however, defer any further remarks until next week.

Notices to Correspondents.

ABORTION IN THE WHEAT EAR: *J C.* We cannot explain it. But the case in question is by no means so serious as it sometimes is. We have seen acres wholly dead before being ripe; and sometimes ears with only their upper part thus destroyed. In your case only occasional florets seem to have perished. Wet and stormy weather during the period of flowering may have hindered the fertilisation of the seed.

GUERNSEY COW: *Thos. Tordiffe.* Your veterinary attendant should have discovered the mystery by means of a *post mortem* examination. In the absence of any detail of the symptoms before, or the appearance after death, it would be rash to give an opinion, but we do not think the symptoms of choaking a fortnight before had much to do with the death. *W. C. S.*

HAMS: *A B* asks if any of our correspondents can give him any information on the use of pyroligneous acid in the preparation of bacon and hams? Is salting by the ordinary process necessary when the acid is used? or will the acid alone effect the preservation of the meat? And if salting be necessary, should the application of salt precede that of the acid? Is it safe to keep bacon in an open rack uncovered or unprotected from flies throughout the summer?

WEED: *S.* We do not know how to advise for its destruction. We have had it so abundantly in some of our fields that the only remedy appeared to be to plough them up. Fork up the patches, and tramp in the Grass again.—*R H G.* It is the Clover Dodder which is sometimes the cause of mischief in patches through the Clover field, though not of what is commonly understood by the Clover failure. You will find a full history of the plant in past volumes of the *Gardeners' Chronicle.*

Markets.

COVENT GARDEN, JULY 20.

Vegetables are abundantly supplied; Hothouse Grapes and Pine-apples plentiful. Strawberries are scarcer. The supply of Peaches and Nectarines is well kept up. Ripe Gooseberries fetch from 2s. 6d to 3s. 6d. per half sieve. Walnuts and Chestnuts are abundant; Oranges and Lemons though scarcer are sufficient for the demand. Young Carrots and Turnips may be had at from 3d. to 6d. a bunch. Potatoes fetch from 1d. to 2d. per lb. Lettuces and other salading are sufficient for the demand, and so are Mushrooms. French Beans are plentiful. Cut Flowers consist of Heaths, Pelargoniums, Cinerarias, Lily of the Valley, Pinks, Carnations, Rhododendrons, Ranunculuses, and Roses.

FRUITS.

Pine-apples, per lb., 4s to 6s	Lemons, per doz., 1s to 2s
Grapes, hothouse, p. lb., 2s to 5s	Oranges, per doz., 9d to 1s 6d

COAL MARKET.—FRIDAY, July 19.

Carr's Hartley, 14s.; Wallsend Riddell, 13s. 9d.; Wallsend Haswell, 16s. 6d.; Wallsend Hetton, 16s. 9d.; Wallsend Lambton, 15s. 9d.; Wallsend Tees, 16s. 3d.—Ships at market, 66.

SMITHFIELD, MONDAY, July 15.

We have to-day a large supply of Beasts, and the quality is good. Trade is exceedingly dull, and a reduction of fully 2d. per 8 lbs. is submitted to. The number of Sheep and Lambs is also larger; the demand is small, and consequently prices are lower. Calves are plentiful, and about 4d. per 8 lbs. lower than on Friday. From Holland and Germany there are 628 Beasts, 2290 Sheep, 232 Calves, and 10 Pigs; from Spain, 10 Beasts; from Scotland, 200; and 900 from the midland counties.

		Pigs	2 8 — 3 6

FRIDAY, July 19.

The number of Beasts is not large; it, however, exceeds the demand. Trade is exceedingly dull, and Monday's rates are with difficulty maintained. We have a good supply of Sheep and Lambs; the choicest qualities are sold at fully Monday's quotations, but second-rate are lower. There are a great many middling Calves on offer; trade is very bad for them; choicest descriptions make rather more money. Foreign supply consists of 177 Beasts, 540 Sheep, and 196 Calves. There are 113 Milch Cows from the home counties.

HOPS.—FRIDAY, July 19.

—Messrs. PATTENDEN and SMITH report that the demand for new Hops and fine yearlings continues steady at late prices. The accounts from the plantations state that the bine for the most part is progressing favourably. Duty 180,000*l.*

MARK LANE.

MONDAY, JULY 15.—The supply of English Wheat to this morning's market by land carriage samples was small, and the weather being fine, and buyers only inclined to purchase at a decline of 1s. to 2s. per qr. upon the prices of this day se'nnight, it remained unsold at a late hour. Business in foreign was confined to the most retail purchases of necessitous buyers; the quotations may be considered nominally unaltered.—Barley is a slow sale at the terms of last week.—In Beans and Peas there is little doing, and prices are nominally the same. —We observe no alteration in the Oat trade.

FRIDAY, JULY 19.—The arrivals of all kinds of grain from abroad since Monday are good, those of English small. The attendance at market was tolerable, and a fair inquiry was experienced for Wheat of all kinds, and the English left over from Monday was cleared at the full prices of that day se'nnight. Foreign remains unaltered.—Barley, Beans, and Peas maintain our quotations.—Oats of all descriptions are selling at 6d. to 1s. less money.—Flour is in rather better demand, at improved rates.—In Indian Corn there has been very little doing, and prices are nominal, Galatz 27*s.* 6d.—The weather at the beginning of the week was fine and forcing, but since then has been wet, and accompanied in some districts with heavy thunder storms. The trade throughout the kingdom has been less buoyant, and in a few of the principal markets prices for Wheat have receded fully 1s. per qr.—Spring corn has more or less participated in the backward movement. At Konigsberg and Dantzic the markets were much excited, and irregular prices have been paid, on the whole exceeding the late advance in Mark-lane.

LIVERPOOL, FRIDAY, JULY 12.—We had a firm and steady trade in corn since Tuesday, with a little improvement in the weather. At this morning's market the business in Wheat and Flour was to a moderate extent, at very full prices, holders showing much confidence. A good many Oats were sold, and prices were 1d. per bushel higher. Barley, Beans, and Peas supported late rates. There were some buyers of Indian Corn at market, who would have operated if holders would have conceded a little in price, but they were firm for late prices, and the actual business was only limited.—TUESDAY, JULY 16.—The imports of grain, meal, and flour this week are upon a moderate scale. The attendance at our Corn Exchange this morning was shy, and the business small. Wheat was 1d. to 2d. per bushel lower than last Tuesday, but there appeared as much difficulty in making purchases as in effecting sales at the decline. No change in Barley, Beans, or Peas. Good Oats being scarce, fully supported late rates. We have to note a decline of from 6d. to 1s. per qr. on Indian Corn. Prices: Wheat, English, red, per 70 lbs., 6s. 0d. to 6s. 6d.; white, 6s. 2d. to 6s. 8d. Barley, Scotch and Irish, per 60 lbs., 2s. 9d. to 3s. Malt, English, per qr., pale, 48s. to 52s. Oats, English and Scotch, per 45 lbs., 2s. 8d. to 2s. 10d. Beans, English, per qr., 27s. to 31s. Peas, do. do., 26s. to 29s.

NEW EDITION OF

PROF. LINDLEY'S INTRODUCTION TO BOTANY.

Recently published, in 2 vols. 8vo, with Six Copper-plates and numerous Wood Engravings, price 24s. cloth,

INTRODUCTION TO BOTANY.

By Professor LINDLEY, Ph.D. F.R.S. Professor of Botany in University College, London, &c. Fourth Edition, with Corrections and numerous Additions.

EXTRACT FROM PREFACE.

In this new and enlarged Edition, the Author has followed very nearly the method recommended by the celebrated Professor De Candolle, than whom no man is entitled to more deference, whether we consider the soundness of his judgment in all that relates to order and arrangement, or the great experience which a long and most successful career of public instruction has necessarily given him.

The Author has begun with what is called ORGANOGRAPHY (Book I.); or an explanation of the exact structut of plants; a branch of the subject comprehending what relates either to the various forms of tissue of which vegetables are constructed or to the external appearance their elementary organs assume in a state of combination. It is exceedingly desirable that these topics should be well understood, because they form the basis of all other parts of the science. In physiology, every function is executed through the agency of the organs: systematic arrangements depend upon characters arising out of their consideration; and descriptive Botany can have no logical precision until the principles of Organography are exactly settled. A difference of opinion exists among the most distinguished botanists, upon some points connected with this subject, so that it has been found expedient to enter occasionally into much detail, for the purpose of satisfying the student of the accuracy of the facts and reasonings upon which he is expected to rely.

To this succeeds VEGETABLE PHYSIOLOGY (Book II.); or the history of the vital phenomena that have been observed both in plants in general, and in particular species, and also in each of their organs taken separately. It is that part of the science which has the most direct bearing upon practical objects. Its laws, however, are either unintelligible, or susceptible of no exact appreciation, without a previous acquaintance with the more important details of Organography. Much of the subject is at present involved in doubt, and the accuracy of some of the conclusions of physiologists is inferred rather than demonstrated; so that it has been found essential that the grounds of the more popularly received opinions, whether admitted as true or rejected as erroneous, should be given at length.

Next follows GLOSSOLOGY (Book III.); or, as it was formerly called, TERMINOLOGY; restricted to the definition of the adjective terms, which are either used exclusively in Botany, or which are employed in that science in some particular and unusual sense. The key to this book, as also to the substantive terms explained in Organography, will be found in a copious Index at the end of the volume.

It has been the Author's wish to bring every subject that he has introduced down, as nearly as possible, to the state in which it is found at the present day. In doing so, he has added so very considerable a quantity of new matter, especially in what relates to Vegetable Anatomy and Physiology, that the present Edition may be considered, in those respects, a new work.

Just published, in demy 8vo, price 2s. 6d.

ORCHIDACEÆ LINDENIANÆ; or, Notes upon a Collection of Orchids formed in Colombia and Cuba, by Mr. J. LINDEN. By JOHN LINDLEY, Ph. D., F.R.S. and L.S., Professor of Botany in the University of London, and in the Royal Institution of Great Britain.

"We assure our readers that it contains a vast quantityof matter interesting and useful to many classes of persons, and to none more so than to Pharmaceutists, to whom we strongly and cordially recommend it."—*Pharmaceutical Journal.*

PROFESSOR LINDLEY'S ŒCONOMICAL BOTANY.

This day is published, in one vol. 8vo, with numerous woodcuts, price 14s.

MEDICAL AND ŒCONOMICAL BOTANY; or, An Account of the Principal Plants employed in Medicine or Domestic Œconomy.

EXTRACT FROM THE AUTHOR'S PREFACE.

"The Vegetable Kingdom contains, among a large quantity of plants of no known importance to man, various useful species employed in medicine, the arts, or in the many branches of domestic œconomy. The principal part of those which can be brought by teachers in Europe under the notice of students, or which, from their great importance, deserve to be among the earliest subjects of study, are mentioned in the following pages, where they are arranged in the manner proposed in the 'VEGETABLE KINGDOM' of the author, with the sequence of matter departed from in a few instances, when it was believed that the convenience of younger students would be consulted by doing so. The author trusts that this selection will be found to have been made in such a way that all teachers who possess reasonably extensive means of illustrating their lectures, and all Botanic Gardens, may furnish the larger part of the species which are mentioned. A small selection was indispensable; firstly, because a greater work would have been beyond the reach of the majority of purchasers; and secondly, because experience shows us that those who have to study a science of observation, such as Botany, require to concentrate their attention, in the first instance, upon a limited number of objects."

THE ELEMENTS OF BOTANY, Structural, Physiological, and Medical. With a Sketch of the Artificial Methods of Classification, and a Glossary of Technical Terms. Price 12s. cloth.

The Glossary may be had separately, price 5s.

This will complete the series of Elementary Botanical Works by Professor LINDLEY, of which "School Botany," and "The Vegetable Kingdom," form the other parts.

THE VEGETABLE KINGDOM; or the Structure, Classification, and Uses of Plants; illustrated upon the Natural System. Second Edition. 500 Illustrations. Price 36s. in cloth.

*** To suit the convenience of Students and others, the above Work is issued also in 12 Monthly Parts, price 2s. 6d. each.

London: BRADBURY and EVANS, 11, Bouverie-street

Handsomely bound in cloth, with 93 Wood Engravings, Price 6s. 6d.,

ILLUSTRATIONS OF THE BIBLE, AND CONFIRMATIONS OF SACRED HISTORY, from the Monuments of Egypt. By W. C. TAYLOR, LL.D.

From the British Magazine.—"This is an elegant and well executed little book, on a most interesting subject."

From the Birmingham Herald—"A valuable and indispensable accession to the library of every Biblical student."

From the Rev. Thomas Hartwell Horne's Introduction to the Critical Study of the Scriptures.—"Nearly 300 texts of Scripture are more or less explained in this elegantly-executed volume, and in a manner equally curious and interesting."

Price 5s. 6d., cloth,

THE HISTORY OF THE UNITED STATES OF AMERICA. By JOHN FROST, of Philadelphia.

Price 7s. 6d., cloth,

THE HISTORY OF FRANCE, from the Earliest Period. By EMILE DE BONNECHOSE. The two volumes of the French edition comprised in the one of the translation. This work is the history approved of by the Minister of Public Education in France, where it has already passed through five editions. London: D. BOGUE, 86, Fleet-street.

Popular Works

PRINTED FOR

TAYLOR, WALTON, AND MABERLY,

BOOKSELLERS AND PUBLISHERS TO UNIVERSITY COLLEGE,

28, UPPER GOWER-STREET, AND 27, IVY LANE, PATERNOSTER ROW, LONDON.

DARLEY'S SCIENTIFIC LIBRARY

FOR THE USE OF

SCHOOLS, PRIVATE STUDENTS, ARTISTS, AND MECHANICS.

IT is the purpose of this Work to furnish a Series of Elementary Treatises on Mathematical Science, adapted to the wants of the public at large. To youth of either sex at public and private schools; to persons whose education has been neglected, or whose attention has not been directed in early life to such studies; and to Artists and Mechanics these little works will be particularly suited. The principles of the various Sciences are rendered as familiar and brought as near to our commonest ideas as possible; the demonstrations of propositions are made plain for the mind and brief for the memory, and the Elements of each Science are reduced not only to their simplest but to their shortest form.

I.

A NEW EDITION (being the fifth) *is now ready,*

A SYSTEM

OF

POPULAR GEOMETRY;

Containing in a few Lessons so much of the Elements of Euclid as is necessary and sufficient for a right understanding of every Art and Science in its leading truths and great principles.

BY GEORGE DARLEY, A.B.

Price 4s. 6d., cloth.

II.

NEW EDITION (just published),

COMPANION

TO THE

POPULAR GEOMETRY;

In which the Elements of Abstract Science are familiarised, illustrated, and rendered practically useful to the various purposes of life, with numerous Cuts.

BY GEORGE DARLEY, A.B.

Price 4s. 6d., cloth.

III.

THIRD EDITION,

A SYSTEM

OF

POPULAR ALGEBRA;

WITH

A Section on PROPORTIONS and PROGRESSIONS.

BY GEORGE DARLEY, A.B.

Price 4s. 6d.

"For Students who only seek this limited knowledge of these sciences, there are, perhaps, no treatises which can be read with more advantage than 'Darley's Popular Geometry an Algebra.'"—*Library of Useful Knowledge, article "Mechanics."*

IV.

SECOND EDITION,

A SYSTEM

OF

POPULAR TRIGONOMETRY,

Both Plane and Spherical.

With POPULAR TREATISES on LOGARITHMS, and the Application of Algebra to Geometry.

BY GEORGE DARLEY, A.B.

Price 3s. 6d., cloth.

V.

FAMILIAR ASTRONOMY.

BY GEORGE DARLEY, A.B.

WITH ENGRAVINGS.—12mo, 5s., cloth lettered.

"There is a vast deal of astronomical information conveyed in a most winning and unassuming manner in this delightful little volume, which not less for the novelty of its plan than the extent of its intelligence, reflects infinite credit on the taste and talents of its projector and editor, Mr. Darley."—*Sun.*

DEANE'S WARRANTED GARDEN TOOLS.—Horticulturists, and all interested in Gardening pursuits, are invited to examine G. and J. DEANE'S extensive Stock of GARDENING AND PRUNING IMPLEMENTS, best London made Garden Engines and Syringes, Coalbrookdale Garden Seats and Chairs.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

F. M'NEILL AND Co., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of THE ASPHALTED FELT FOR ROOFING Houses, Farm Buildings, Shedding, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained TWO SILVER MEDAL PRIZES, and is the Felt SOLELY patronised and adopted by

HER MAJESTY'S WOODS AND FORESTS,
HONOURABLE BOARD OF ORDNANCE,
HONOURABLE EAST INDIA COMPANY,
HONOURABLE COMMISSIONERS OF CUSTOMS,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANIC GARDENS, REGENT'S PARK,

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the ROYAL AGRICULTURAL SOCIETY'S HOUSE, Hanover-square.

It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

PRICE ONE PENNY PER SQUARE FOOT.

*** Samples, with Directions for its Use, and Testimonials of seven years' experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.

☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are

F. M'NEILL AND CO.'S

Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where roofs covered with the Felt may be seen.

The new Vice-Chancellor's Courts, at the entrance to Westminster Hall, were roofed with F. M'NEILL and Co.'s Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.

NOTE.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

SCIENTIFIC ACADEMY AND AGRICULTURAL TRAINING SCHOOL, Kennington, near London, July 20, 1850.

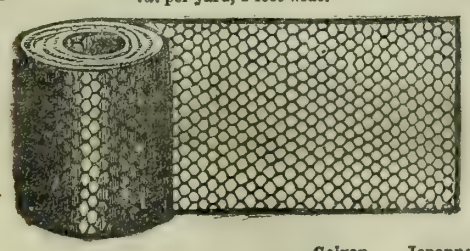
MESSRS. NESBIT take the liberty of directing the attention of Parents to the advantages offered by their Establishment, in the education of youth intended for the Arts, Manufactures, or Agriculture. Though the power, influence, and wealth of England, depend, in a great measure, upon the proper application of scientific knowledge to the working of her minerals and soils; yet, in the education of her youth, Science has hitherto been almost wholly neglected. It is, however, evident that a young man, who, in addition to the common education, possesses a sound knowledge of Analytical Chemistry, Mineralogy, and other kindred subjects, will be the best prepared to engage with success in any technical branch of business for which he may be designed.

In their system of instruction, Messrs. NESBIT give a prominent position to the physical sciences; and experience has proved that instead of retarding the pursuit of the ordinary studies, they materially assist in their acquirement.

The pupils have repeatedly been examined by some of the first Professors in the Metropolis, who have expressed themselves highly gratified with their general knowledge, and with their attainments in physical science.

Terms and other particulars may be known on application.
38, Kennington-lane, London.

MESSRS. NESBIT'S CHEMICAL AND AGRICULTURAL SCHOOL, 38, Kennington-lane, London.—A sound practical knowledge of Analytical and Agricultural Chemistry, Geology, Surveying, Levelling, Railway Engineering, &c., may be obtained in Messrs. NESBIT'S Academy, in addition to a good modern education.



Mr. NESBIT'S works on Arithmetic, Mensuration, Gauging, Land Surveying, English Parsing, &c., are published by LONGMAN and Co., and may be had of all Booksellers.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, especially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the Nobility, Gentry, and Clergy, for out-door work at their country seats, The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.

Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to WALTER CARSON, No. 9, Great Winchester-street, Old Broad-street, Royal Exchange.

No Agents.—All orders are particularly requested to be sent direct.

GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.

	Galvanised.	Japanned Iron.
2-inch mesh, light, 24-inch wide ...	7*d.* per yd.	5*d.* per yd.
2-inch ,, strong ,, ...	9 ,,	6½ ,,
2-inch ,, extra strong ,, ...	12 ,,	9 ,,
1⅝-inch ,, light ,, ...	8 ,,	6 ,,
1⅝-inch ,, strong ,, ...	10 ,,	8 ,,
1⅝-inch ,, extra strong ,, ...	14 ,,	11 ,,

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

YORKSHIRE AGRICULTURAL SOCIETY.—Open to the United Kingdom. Meeting at Thirsk, August 8, 1850. Entry closes 24th July.—Prize Sheets, Forms of Entry, &c., may be had gratis of M. M. MILBURN, Secretary, Thirsk, Yorkshire.

FOR WATERING GARDENS, BREWERS' USE, &c.
FLEXIBLE INDIA-RUBBER HOSE PIPES.

JAMES LYNE HANCOCK, Sole Licensee and Manufacturer of the PATENT VULCANISED INDIA-RUBBER PIPES and TUBING.

These Pipes are well adapted for Watering Gardens, conveying Liquid Manure, racking Beer and Cider, Gas Fittings, Chemical and all purposes where a perfectly sound WATERPROOF and FLEXIBLE PIPE is required.

Hot Liquors or Acids do not injure them. No oil or dressing is required in using them. They do not leak from remaining out of use, are permanently Flexible in all Temperatures, and are therefore particularly suitable for Fire Engines; and, from their not leaking, are found exceedingly useful in conveying hot or cold water to baths in dwelling houses and such like purposes.

A LIGHT VULCANISED INDIA-RUBBER HOSE is now manufactured for conducting Water and Fluids, at the following prices per foot:

Size.	¼ in.	⅜ in.	½ in.	1 in.	1½ in.	2 in.	2½ in.	3 in.
1 ply ...	0*s.* 5*d.*	0*s.* 6*d.*	0*s.* 8*d.*	0*s* 10*d.*	1*s.* 0*d.*	1*s.* 2*d.*	1*s.* 4*d.*	1*s.* 6*d.*
2 ply ...	0 8	0 9	1 0	1 2	1 5	1 8	2 0	2 3
3 ply ...	0 11	1 0	1 3	1 6	1 10	2 2	2 9	3 3

N.B. Vulcanised India-Rubber Garden Hose fitted with roses, jets, and branches, complete, with union joints ready to attach to pumps or water cisterns.

All orders or letters addressed to J. L. HANCOCK, at the Manufactory (and Warehouse), Goswell-mews, Goswell-road, London, will meet with immediate attention.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

IRON AND WIRE FENCING,
AND METALLIC BEDSTEADS.

THOMAS PERRY AND SONS,
252, OXFORD-STREET (NEAR HYDE PARK),
And Highfields Foundry and Wrought-iron Works, Bilston, Staffordshire, Manufacturers of all descriptions of
PLAIN AND ORNAMENTAL IRON AND WIRE FENCING,
Park Entrance, Carriage and Field Gates, Wickets, &c.;
Deer, Sheep, and other Hurdles;
Hare and Rabbit-proof Wire Fencing;
Iron Bedstead Makers to the Board of Ordnance;
And Government Contractors.

The works of Messrs. PERRY being situated in the heart of the first iron district, they are enabled to execute all orders with the greatest facility, and on the most moderate terms. Drawings made and estimates prepared, if required. The showrooms contain an immense variety of every description of Iron and Wire-work, and are the largest in London. An Illustrated Catalogue of Bedsteads, with dimensions and prices, sent on application, post-free.

BRENTFORD.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, MARKET-GARDENERS, AND PUBLIC COMPANIES, ENGAGED IN PLANTING.

MESSRS. PROTHEROE AND MORRIS are favoured with instructions to submit to an unreserved Sale, by Auction, on the premises, Brentford Nursery, Middlesex, about the second week in October (by order of the executors of the late Mr. J. Ronalds), the whole of the valuable NURSERY STOCK, riding over about 30 acres, consisting of a large and rich assortment of Standard and Dwarf Maiden, Trained and Untrained Fruit trees, of every description; Ornamental trees, Deciduous and American Shrubs; fine Evergreens, &c. Further particulars in future advertisements.

American Nursery, Leytonstone, July, 1850.

ESSEX.—TO NURSERYMEN, HORTICULTURISTS, FLORISTS, AND MARKET GARDENERS.

TO BE LET, with immediate possession, the singularly desirable Estate known as GLAZENWOOD, for many years occupied by Mr. CURTIS, and situate near to the towns of Braintree and Coggeshall, and within 2½ miles of a Railway Station. It comprises a Villa Residence, a commodious Messuage, large Conservatory, Counting-house, Barn, Fruit-rooms, Stable, and other convenient Buildings, with about 45 acres of superior Land, of which 10 acres, or thereabouts, form the celebrated American Gardens, and Nursery Grounds; the remainder is chiefly planted with the choicest Fruit-trees; and the whole abounds with choice Stock in every variety, for which these grounds have for so many years been so justly celebrated. —For rent and other particulars, apply to Messrs. BEAUMONT and THOMPSON, 19, Lincoln's-inn-Fields, London; or to Messrs. COOK and SONS, Land Agents and Auctioneers, Stratford St. Mary, Suffolk.

TO BE LET, at moderate rents, in Carmarthenshire, two genteel Residences—Dyffryn House, with three acres of Grass Land, and Careg Cenen, with from 300 to 500 acres of Arable and Grass Land, if required. Both places are within a drive of Swansea, to which the South Wales Railway is now open. For particulars, with a lithograph of Dyffryn House apply to T. W. LAWFORD, Tirydail, Llandilo; or Messrs. ROWLAND, HACON, and ROWLAND, 38, Threadneedle-street, London

---

FARM ON THE LINCOLNSHIRE WOLDS.

TO BE LET, and entered upon at Lady-day next, at South Thoresby, near Alford, a good FARM-HOUSE and Offices, with 300 Acres of Land, for the last 18 years in the occupation of Mr. JOHN HICKSON, deceased; together with about 14 Acres more adjoining. Lime of superior quality can be had from an extensive kiln on the spot. The Rail station is about one mile distant.—For particulars, and to view this very desirable Farm, apply to THOMAS KEAL, Thoresby.

READINGS OF POETRY, OLD AND NEW, BY MISS MITFORD.

THE LADIES' COMPANION, for July 20, contains, in addition to the above:—The Story of a Bouquet. By PAUL BELL.—Words for Music. No. II.—Legends of Life. By Mrs. T. K. Hervey.—Mademoiselle Rachel.—Review.—On the Appreciation of Truth in Art.—Hair Work. Second Article.—Amusements.—Parlour-Window Talk, &c. &c., with Illustrations.

Published Weekly, price 3*d.*, stamped 4*d.*, and in Monthly Parts. Parts I. to VI. are now ready.

Office, 11, Bouverie-street, and all Booksellers and Newsmen.

THE LONDON AND WESTMINSTER BANK issues CIRCULAR NOTES for 10*l.* each for the use of travellers and residents on the Continent. These Notes are payable at every important place in Europe, and thus enable a traveller to vary his route without inconvenience; no expense is incurred, and when cashed no charge is made for commission. They may be obtained at the head office of the London and Westminster Bank in Lothbury; or at its branches, viz., 1, St. James's-square; 214, High Holborn; 3, Wellington-street, Borough; 87, High-street, Whitechapel; and 4, Stratford-place, Oxford-street. J. W. GILBART, General Manager.

BEAUTIFUL BOUQUETS OF FLOWERS may be preserved perfectly Fresh and Blooming, for several days, in GLASSES adapted for Gentlemen's button-holes, any part of a Lady's dress, the Hand, or for plaiting into the Hair; and are forwarded, post free, to any part of the Kingdom, in a box containing one dozen, assorted, on receipt of postage stamps, value 2*s.* 6*d.*, by JACKSON and TOWNSON, 89, Bishopsgate-street Within, London.

CANTERBURY SETTLEMENT. — NOTICE is HEREBY GIVEN, that the TERMS of PURCHASE under which LAND may be BOUGHT in the Canterbury Settlement, with the privileges secured to the first body of Colonists, on or before the 29th of August, the day on which the first Four Ships, chartered by the Association, will sail from the East India Docks, may be obtained on application to the Secretary.

By order of the Committee,
H. F. ALSTON, Secretary.

Canterbury Association, 20, Cockspur-street,
July 20, 1850.

INTERESTING FACT.—The following singular and authentic case of restoration of the human hair is worthy of observation, more particularly as it relates to an article of high and universal repute during the last half century. "Mr. A. Hermann, of Queen-street, Soho, had been quite bald for some time past, and had tried various preparations for the recovery of his hair, but without any beneficial result. He was then induced to try the effects of 'Rowland's Macassar Oil,' and after daily applying it for about two months, he, much to his gratification, had his hair quite restored, and now possesses a beautiful head of hair. This fact speaks too strongly for itself to require comment."—*Bell's Weekly Messenger.*

ROWLAND'S MACASSAR OIL.—The unprecedented success of this discovery in restoring, preserving, and beautifying the Human Hair, is too well known and appreciated to need comment. For Children it is especially recommended as forming the basis of a Beautiful Head of Hair, and rendering the use of the fine-comb unnecessary. Price 3*s.* 6*d.*—7*s.*—Family Bottles (equal to 4 small), 10*s.* 6*d.*, and double that size, 21*s.* per bottle.

*** Each bottle of the genuine article has the words ROWLAND'S MACASSAR OIL engraved in two lines on the Wrapper; and on the back of the Wrapper nearly 1500 times, containing 29,028 letters.

Sold by A. ROWLAND and SONS, 20, Hatton Garden, London; and by Chemists and Perfumers.

CHEAP EXCURSIONS TO WINDSOR AND BACK FOR 2*s.*, intermediate stations in proportion.—GREAT WESTERN RAILWAY.—A train from Paddington every Sunday morning at 9.45 A.M., returning from Windsor at 8 P.M.; On Mondays a train from Paddington at 10.45, returning at 8. To Slough or Windsor and back, 2*s.*, 3*s.*, and 4*s.*; to West Drayton and back, 1*s.* 6*d.*, 2*s.*, and 3*s.*; to Hanwell or Southall and back, 9*d.*, 1*s.* 6*d.*, and 2*s.*; to Ealing and back, 6*d.*, 1*s.*, and 1*s.* 6*d.* From intermediate stations to Slough or Windsor and back, 1*s.* 6*d.*, 2*s.*, and 3*s.* The third class are open carriages. A compartment of a first or second class carriage, or a saloon carriage, will be reserved for parties on due notice previously given to the superintendent.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn-place, in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 7, Church-row, Stoke Newington, both in the County of Middlesex, Printers, at their office in Lombard-street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles-street, in the parish of St. Paul's, Covent-garden, in the said county, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, JULY 20, 1850.

The above will be held at Thirsk, in the county of York, on the 7th and 8th days of August next, being the days of the Yorkshire Agricultural Society's Meeting, when prizes not exceeding 50*l.* will be offered for Flowers, Fruits, Vegetables, Cottage Garden Produce, &c. Schedules and further information may be had on application to the Secretary's Office, Thirsk.—N.B. All articles admitted for exhibition free of charge.

Thirsk, July 27. ROBERT HICK, Secretary.

TO THE LOVERS OF FERNS.

WILLIAM MASTERS, Exotic Nursery, Canterbury, has to offer a fine Collection of well-grown Plants of this interesting family, at 42*s.* per dozen, where the selection is left to himself.—Canterbury, July 27.

NEW SEEDLING STRAWBERRY—MYATT'S "SURPRISE."—This is a variety raised from the British Queen, which it resembles, though of a more robust habit, and a very free bearer, producing a greater abundance of those large angular-shaped Strawberries than any other variety, and finishing off the last fruit of a good size. Strong plants will be ready the beginning of August, price 50*s.* per 100.

Manor Farm, Deptford, July 27.

CONIFERÆ, CONIFERÆ, CONIFERÆ!
MILFORD NURSERY, NEAR GODALMING, SURREY.

WILLIAM YOUNG begs the attention of Noblemen, Gentlemen, and Planters in general to inspect his extensive collection of CONIFEROUS PLANTS, consisting of Araucarias, Deodaras, Douglasii, and all the leading kinds, from 1 foot to 10 and 15 feet high, with Cryptomeria japonica, bearing perfect cones. Likewise to the admirers of Yuccas, having now in flower and in full bloom, Yucca gloriosa, accuminata, glauca, recurva, &c., throwing flower stems 10 feet high, with from 300 to 500 flowers on each as large as a good sized Tulip.

Milford Nursery is one square piece of ground, about 30 acres, on a particular dry and healthy soil, filled with the most choice kinds of Ornamental Trees, Shrubs, and Forest Trees of every description; Ash, Birch, Chestnut, Hazel, Willow; Scotch, Larch, Silver, and Spruce Firs; and other hardy Forest Trees, being planted for sale by the 100,000, whence they transplant equal to, if not better, than any other nursery in England.

Milford Nursery is two miles from the Godalming Station of the South-Western Railway, where conveyances are always in attendance.

SEEDLING PELARGONIUM—"PRINCE ARTHUR."

A. PONTEY begs to announce that he will send out, on Monday, the 14th October, at 1 guinea each, or four plants for 3 guineas, his seedling Pelargonium, for which the highest prize, the Silver Medal, was awarded at the Exhibition of the Royal Devon and Cornwall Horticultural Society on the 16th May; also a certificate of merit was awarded at the Devon and Exeter Exhibition, on the 24th May, and a certificate of merit at Torquay Exhibition on the 6th June.

The Splendid Pelargonium is thus described in the "Floricultural Cabinet," July:—"Upper petals large, dark clouded blotch shaded off to flesh colour, lower ones flesh colour, centre white; petals of firm substance."

Mr. Glenny's opinion of its habits and the peculiarity of its white throat, which he affirms is "purer than that of any one of the present varieties," has been given in the Country Gentleman, weekly garden newspaper.—July 27.

ROYAL BOTANIC SOCIETY of LONDON.—The Days appointed for the EXHIBITIONS in the Gardens of this Society NEXT YEAR, are as follows: GENERAL EXHIBITIONS—Wednesdays, May 14; June 11, and July 2.
AMERICAN PLANTS—Saturdays, May 31; and June 7.
By order of the Council. J. DE C. SOWERBY, Secretary.

GERANIUMS. — Twelve of the following Show Flowers for 21*s.*, in plants adapted for stock, or 2*s.* 6*d.* each:—Crusader, Brilliant, Purity, Cassandra, W. Gilbert, Rosamond, Belle of the Village, Virgin Queen, Negress, Peral, Salamander, Painted Lady, Forget-me-not, Aurora, and Lucretia.—SAMUEL WALTERS, Hilperton, near Trowbridge, Wilts.

FIRST-RATE NEW FUCHSIAS AND VERBENAS OF 1850.

WM. RUMLEY AND SONS have to offer 12 of the following superb new FUCHSIAS for 18*s.*, 6 for 10*s.*; or 2*s.* 6*d.* each, true to name, free by post, viz.: Beauty of Hertford, Mrs. W. Taylor, Inaccessible, Kossuth, Acteon, Corinium, Confidence, Grand Master, Pearl of England, Rosamond, General Changarnier, Don Giovanni, Globosa alba grandiflora, Multiplex, Gladiator, Striata, Prince of Orange, Yorkshire Eclipse, Beauty of Richmond, Distinctus, &c.

VERBENAS.—Twelve of the following superb new varieties for 10*s.* 6*d.*, or 6 for 6*s.*; viz.: Laura, Letitia, Masterpiece, Monitor, Wonderful, Magnificent, Desdemona, Anais, Phaeton, Beaute de Rivage, Reine, Hortense, Perriers, Cypariese, Belle Etoile, Calliope, &c.—Fuchsia spectabilis, strong plants, 1*s.* 6*d.* each. Cantua bicolor, 1*s.* each. Browallia Jamesoni, 1*s.* each. The above will be forwarded immediately, in fine strong plants, on receipt of a Post-office order, payable at Richmond.—Gilling, Richmond, Yorkshire.

MAYLE'S MODEL FUCHSIAS FOR 1850.—No grower can expect to win a prize at any of the principal exhibitions in town or country without these magnificent reflexed varieties.

Messrs. MAYLE and Co. will send out their SEVEN NEW FUCHSIAS on the 20th June, extra strong plants. From the very high opinions expressed of their merits by Dr. Lindley, Mr. Glenny, &c., they require no further comment from us. They are the things of the season, and must be had by all who wish to keep pace with the times.

No. 1, DIADEM, was shown at Walsall, near Birmingham, with two blooms, May 8th, and was awarded an extra prize. Judges' opinion: "By far the best ever raised."

Also first prize at Wolverhampton, May 25, against some fine older specimen varieties; and first-class certificate awarded at the Birmingham and Midland Society on the 20th.

Those in bloom were exhibited at Chiswick and Regent's-park June Shows. The earliest orders will secure the strongest plants. Circulars can be had. Also Mr. Hoyle's superb Geraniums, a few extra strong blooming plants being left.

Stove, Greenhouse, Bedding Plants, &c., including every novelty of the season.—105, New-street, Birmingham.

NEW AND FIRST-RATE VERBENAS, FUCHSIAS, PETUNIAS, &c.

GEORGE SMITH begs to draw the attention of the Public to his unrivalled Collection of the above. His VERBENAS have been shown and prizes awarded them at the Royal Botanic Gardens, Regent's-park; the Horticultural Society, Chiswick; the Central Society of Florists; the Royal South London Floricultural Society. Strong Plants of all the foreign and English new varieties are now ready, viz.:—Smith's Calliope, Desdemona, Masterpiece, Monitor, Young's Laura, Letitia, Barker's Mass, Rosa Alba, Gem, Village Maid, Rosy Morn, St. Katherine, Salter's Infant de Versailles, Souvenir de Marie, Electra, Perry's Wonderful, Woodcock's Magnificent, Turner's Mrs. Mills, Chauviere's Adele, Anais, Cyparisse, Gloire de Paris, Niobe, Pauline, Perrier, Reine Horteuse, Silene, Miellez, Brind d'Amour, Figaro, Follette, Jeanne d'Arc, Massena, Nigricans, Dufoy's Admiration, Boule de Neige, Anacreon, Buffon, Daubenton, Satyr, Romulus, Boudinot's Bajeaus, Celestina, Fanny, Justine, and Madame de Gournay; 12 for 12*s.*, or 24 for 21*s.*

FUCHSIAS.—Smith's Kossuth, Orion, Queen of May, Turner's Sir J. Falstaff, Kendall's Dr. Grosse, Novelty, Glasscock's Mrs. W. Taylor, Beauty of Stortford, Gregory's Cerinium, Actæon, Rumley's Beauty of Richmond, Yorkshire Eclipse, Distinctus, Storey's Mirabilis Unique, Multiplex, Duplex, Ignea, Striata, Miellez, Duchesse de Bordeaux, Elisa Miellez, General Changarnier, General Oudinot, President Porcher, and Dubas's Nonpareil; 21*s.* per doz.

PETUNIAS.—Young's Picta, Letitia, Youngii, Smith's North London Miellez Angele, Triumph, Beauté Parfait, and Ne Plus Ultra. The fine new Lantana delicatissima; Heliotropium corymbosum, 1*s.* 6*d.* each; Cuphea atropurpurea and Donkelarii, 1*s.*

Plants can be sent by post or rail. Extra plants for long carriage. Post-office orders made payable at Islington.

Tollington Nursery, Hornsey-road, Islington, London.

STRAWBERRIES AND CELERY.—The season for Planting being close at hand, the Advertiser begs to remind those who are desirous of having clean Fruit, and in the greatest perfection, that no time should be lost in procuring Strawberry Tiles to place down when the plants are set, as without them the gardener cannot place them so exact as he otherwise could; consequently, the same advantages cannot be obtained. The satisfactory testimonials received from persons who tried the Celery Sockets last season warrants the Advertiser in hoping that they will be in use in every garden where a good and clean article is valued. Particulars can be had by inclosing three postage stamps to Mr. JOHN ROBERTS, 34, Eastcheap, London.

GREENHOUSE AND CONSERVATORY BUILDING ESTABLISHMENT, HOT-WATER APPARATUS MANUFACTORY, KENSALL-GREEN, HARROW-ROAD, LONDON.

JOHN TAYLOR begs most respectfully to call the attention of the Nobility, Gentry, and Gardeners, to the very superior manner in which he erects all kinds of Greenhouses, Conservatories, Forcing Pits, &c., and all other buildings for Horticultural purposes, combining all the most modern improvements with elegance and utility. His manner of heating Horticultural Buildings, Churches, Chapels, Public Buildings, Entrance Halls, &c., has received the greatest approbation from the Nobility and Gentry by whom he has been extensively engaged.

TO THE ADMIRERS OF THAT SPLENDID AUTUMNAL FLOWER, THE CHRYSANTHEMUM.

YOUELL AND Co. are now prepared to execute orders from their extensive and very select collection of the above, comprising all the new and fine continental varieties, at the following prices:

50 best new sorts ..... 25*s.*
25 ditto ..... 15*s.*
12 ditto ..... 9*s.*

Well established in small pots, or by post free.

NEW DWARF CHINESE OR LILLIPUTIENNE CHRYSANTHEMUMS.

This new and beautiful class are well deserving the attention of cultivators from their exceeding dwarf habit (not attaining more than 1 foot in height). The profusion of flowers with which they are covered, as well as the great variety and distinctness of colour, will render them general favourites. Strong plants for autumn blooming are now ready for sending out at the following prices:

9 fine varieties sent out last year (for the first time) for 9*s.* 0*d.*
13 do. raised by M. Lebois (and sent out for the first time this season), for..... 30 0

One sent over to the Trade when two are ordered.

The latter are figured in the last December Number of the "Annales de la Societé d'Agriculture et de Botanique de Gand," and are perfect gems, engravings of which may be seen at YOUELL and Co.'s Nursery.

Descriptive Catalogues of the above may be had on application. Printed directions of their successful and easy method of cultivating the Chrysanthemums for exhibition, &c., will be forwarded with all orders.

ANEMONE SEED,

Saved from selected sorts, is now being harvested by YOUELL and Co. in the finest condition, and can be forwarded, per post free, at 2*s.* 6*d.* and 5*s.* per packet, sufficient to sow a bed of 12 and 24 yards. If sown at the present time it will afford a fine display through the autumn and winter months.

Royal Nursery, Great Yarmouth.

HOYLE'S SEEDLING PELARGONIUMS FOR 1850.

CHARLES TURNER will send out, early in the Autumn, strong established plants of the following distinct varieties raised by G. W. Hoyle, Esq. Ajax gained the 4*l.* and Ocellatum the 3*l.* prizes at the Great Seedling Pelargonium Show, Surrey Gardens, in June last, being two of the four prizes awarded on that occasion. Early orders will ensure first selection.

AJAX.—A noble dark variety, smooth, and of fine substance, lower petals rosy purple, top petals very dark purple, with even narrow margin of vivid crimson; very free bloomer; has been justly styled "The leading flower of the season." Price 1*l.* 11*s.* 6*d.*

OCELLATUM.—A great novelty, lower petals bright pink, with a distinct and constant spot of deep crimson; top petals deep crimson spot, shaded off with bright rose, white eye, free bloomer, and good grower. Price 1*l.* 11*s.* 6*d.*

MAY QUEEN.—A large, distinct, and pleasing variety. Orange-rose top petals, crimson blotch, shaded off with orange, the five petals have a delicate margin of pale pink; lower petals vivid rose; large well-defined white eye, very free bloomer, will be a great favourite on the home stage. Price 1*l.* 11*s.* 6*d.*

NECTAR CUP.—Rose, top petals rich orange-rose, with narrow pink margin, clear white eye, fine substance, good habit. Price 1*l.* 1*s.*

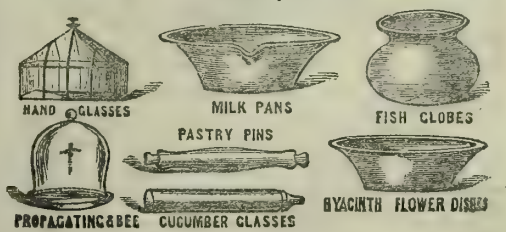
FLAVIA.—Orange-scarlet, the brightest in this class that has been offered, and makes a fine display on the stage, rather crumpled on the edge, and lower petals too long. Price 1*l.* 1*s.*

GENERALISSIMO.—Large and very attractive; lower petals salmon, with spots of a deeper colour, white centre; top petals very dark, rich, and velvety, shaded with lively orange, occasionally crumpled on the edge. Price 1*l.* 1*s.*

RUBIOLA.—Fine crimson scarlet of beautiful texture, dark spot on the top petals, rather deficient in breadth of petals. Price 1*l.* 1*s.*

CORINNE.—Light purple, very smooth and free bloomer, dark top petals. Price 15*s.*

ISIS.—A neat smooth flower, of good quality, very free bloomer, rose with white eye, and dark blotch on top petals. Price 15*s.*



CARDINAL.—Fine rich orange crimson, black blotch on top petals, very smooth, not a strong grower. Price 15*s.*

HEARTSEASE.—Scarlet rose, large fine shape and substance; but being inconstant, purchasers of the above will have a plant without charge.

Price 8*l.* 10*s.* for the set.

Royal Nursery, Slough.

GLASS FOR CONSERVATORIES, HORTICULTURAL PURPOSES, &c.

T. MILLINGTON'S SHEET GLASS, which is of the best description, varying from 16 to 32 ounces, at from 2*d.* per foot and upwards; 100 feet and 200 feet cases of large Sheet Glass, for cutting up, at 2½*d.* per foot. British Plate Glass, from 1*s.* 2*d.* to 2*s.* per foot, according to size. Patent Rough Plate Glass, from ⅜ to 1 inch in thickness, from 4*d.* per foot upwards. Glass Slates and Tiles. Milk Pans from 12 to 24 inches diameter, from 2*s.* to 5*s.* each. Cucumber Tubes, from 12 to 24 inches long, at 1*d.* per inch. Lactometers, 7*s.* 6*d.* each. Wasp Traps.—Lists may be had, on application at the Warehouse, 87, Bishopsgate-street Without, same side as the Eastern Counties Railway.

HARTLEY'S PATENT ROUGH PLATE GLASS.

JAMES PHILLIPS AND CO., 116, Bishopsgate-street Without, beg to hand their list of Prices of the above description of GLASS. Cut to order in panes of

8 by 6	and under	10 by 8	at 4½d. per foot.
10 by 8	,,	14 by 10	at 5d. ,,
14 by 10	,,	1½ foot, or sizes not exceeding 20 inches long	at 5½d. ,,
1½ foot	,,	3 feet, or sizes not exceeding 30 inches long ...	at 6d. ,,

PACKED IN BOXES of 50 feet each.

6 by 4 and 6½ by 4½...10s. 6d. 8 by 6 and 8½ by 6½...13s. 6d.
7 by 5 and 7½ by 5½...12s. 0d. 9 by 7 and 10 by 8 ...15s. 0d.

We do not pledge ourselves to execute large orders for small squares at the above prices, but only as far as they turn up in cutting. Should any quantity of small squares be required, a special contract is necessary.

MILK PANS 2s. to 6s. each, Metal Hand-frames, Tiles, and Slates; Propagating and Bee Glasses from 2d. each; Cucumber Tubes, 1d. per inch; Peach Glasses, 10d. each; Wasp Traps 3s. 6d. per dozen; Pastry Slabs, Hyacinth Glasses and Dishes, Shades for Ornaments, Fish Globes, Plate and Window Glass of every description, and Lamp Shades. Lactometers for trying the quality of Milk, 4 tubes, 7s. 6d; 6 tubes, 10s. Self-registering Thermometers for Greenhouses, Horticultural Glass, &c.

From the *Gardeners' Chronicle*, December 8, 1849:

"As for the article substituted for Rough Plate, and which is actually in the market for the purpose of imposing upon gardeners, it is wholly unfit for any horticultural purpose. The best samples of it which we have yet seen is sold by Mr. JAMES PHILLIPS, 116, BISHOPSGATE STREET, LONDON."

CROWN, SHEET, AND ROUGH PLATE GLASS FOR HOTHOUSES, CONSERVATORIES, &c.

The Improved Patent Rough Plate, made by Messrs. Hartley and Co., can be supplied from this Warehouse, of every size and substance, at the same prices as at the works.

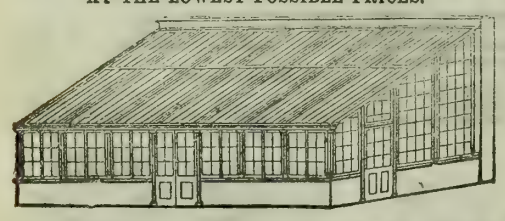
100 and 200 feet cases of large Sheet Glass, from 2½d. per foot. Small ditto, 10s. 6d. per 100 feet, packed in boxes ready for immediate delivery. Curators of Botanical Societies, Florists, Railway Agents, and others requiring large quantities, will, on sending dimensions, receive estimates at the lowest prices.

GLASS MILK PANS, CREAM POTS, Lactometers, Bee Glasses, Fish Globes, and all kinds of Dairy Glass, Propagating Glasses, Hyacinth Dishes, Cucumber Tubes, and every other description of Garden Glasses.

PATENT GLASS PENS, self supplying, never blot, never soil the ruler, and will write continuously for 12 hours.

Also, Glass Rulers, Glass Inks for office-stands, desks, &c. Stationers and Schools supplied. Wholesale Warehouse for Ornamental Shades, Lamp Shades, Gas Glasses, Genuine White Lead, Paints, Colours, and Pumps for Farm purposes.

Our Catalogue of 18 folios is the most complete ever published. No Gardener or Farm Bailiff should be without one. May be had Gratis on sending two postage stamps to Messrs. COGAN and Co., 48, Leicester-square, London.



DEANE'S WARRANTED GARDEN TOOLS.—Horticulturists, and all interested in Gardening pursuits, are invited to examine G. and J. DEANE'S extensive Stock of GARDENING AND PRUNING IMPLEMENTS, best London made Garden Engines and Syringes, Coalbrookdale Garden Seats and Chairs.

G. and J. DEANE are Sole Agents for LINGHAM'S PERMANENT LABELS, samples of which, with the Illustrated List of Horticultural Tools, can be sent, post paid, to any part of the United Kingdom.—DEANE'S Horticultural Tool Warehouse, opening to the Monument, 46, King William-st., London-bridge.

ANTHONY'S PATENT AMERICAN CHURN.—The Silver Medal was awarded to this Implement at the Royal Agricultural Society's Show at Exeter, 1850; Stand No. 25.—Apply to KEY and MITCHELL, Depôt for Patent and other new and useful inventions, 97, Newgate-street, City.

HORTICULTULAL BUILDING AND HEATING BY HOT WATER.
WARRANTED BEST MATERIALS AND WORKMANSHIP AT THE LOWEST POSSIBLE PRICES.

J. WEEKS AND CO., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

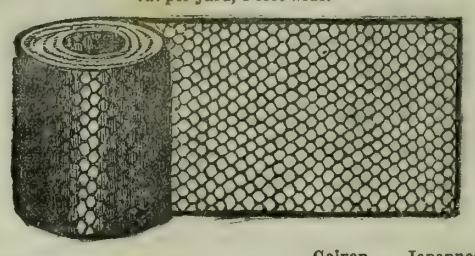
The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

GLASS FOR CONSERVATORIES, &c.

HETLEY AND Co. supply 16-oz. Sheet Glass of British Manufacture, at prices varying from 2d. to 3d. per square foot, for the useful sizes required, many thousand feet of which are kept ready packed for immediate delivery. Lists of Prices and estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE-GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY and Co., 35, Soho-square, London.

See the *Gardeners' Chronicle* first Saturday in each month.



GREENHOUSE TO BE SOLD CHEAP, 20 feet long, 13 feet high, and 11 feet wide, with a 4-light Cucumber Pit and 2-light Frame.—Apply at Mr. CORNER'S, Fountain Cottage, Camberwell-grove, London.

IRON AND WIRE FENCING,
AND METALLIC BEDSTEADS.

THOMAS PERRY AND SONS,
252, OXFORD-STREET (NEAR HYDE PARK),
And Highfields Foundry and Wrought-iron Works, Bilston, Staffordshire, Manufacturers of all descriptions of
PLAIN AND ORNAMENTAL IRON AND WIRE FENCING,
Park Entrance, Carriage and Field Gates, Wickets, &c.;
Deer, Sheep, and other Hurdles;
Hare and Rabbit-proof Wire Fencing;
Iron Bedstead Makers to the Board of Ordnance;
And Government Contractors.

The works of Messrs. PERRY being situated in the heart of the first iron district, they are enabled to execute all orders with the greatest facility, and on the most moderate terms. Drawings made and estimates prepared, if required. The showrooms contain an immense variety of every description of Iron and Wire-work, and are the largest in London. An Illustrated Catalogue of Bedsteads, with dimensions and prices, sent on application, post-free.

GALVANISED WIRE GAME NETTING.—7d. per yard, 2 feet wide.

	Galvanised.	Japanned Iron.
2-inch mesh, light, 24-inch wide ...	7d. per yd.	5d. per yd.
2-inch ,, strong ,, ...	9 ,,	6½ ,,
2-inch ,, extra strong ,, ...	12 ,,	9 ,,
1⅝-inch ,, light ,, ...	8 ,,	6 ,,
1⅝-inch ,, strong ,, ...	10 ,,	8 ,,
1⅝-inch ,, extra strong ,, ...	14 ,,	11 ,,

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3d. per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

STRONG PREMIUM HARE AND RABBIT PROOF WIRE NETTING.

CHARLES D. YOUNG AND COMPANY (LATE W. AND C. YOUNG),
MANUFACTURERS OF IRON AND WIRE WORK, &c.,
22, PARLIAMENT STREET, WESTMINSTER, LONDON;
48, NORTH BRIDGE, EDINBURGH;
32, ST. ENOCH SQUARE, GLASGOW;
1, CASTLE BUILDINGS, DERBY SQUARE, LIVERPOOL;
beg respectfully to call the attention of Landed Proprietors and others to their strong Wire-Net Fence, for excluding Hares and Rabbits from Gardens, young Plantations, Nurseries, &c.

This Net was exhibited at the Show of the Highland and Agricultural Society of Scotland, held lately at Inverness, where its Efficiency, Great Strength, and Exceeding Cheapness attracted general attention, and had awarded from the Judges the Society's Silver Medals, with high commendations.

The immense damage done by Hares and Rabbits in Gardens and Young Plantations is often so great, that in the course of a year or two it will amount to more than the entire cost of protecting them with this Net. It is so durable, that when Plantations are sufficiently advanced to be independent of its protection, it can be removed to other exposed situations with the greatest facility, by any labourer. As a Fence against Hares and Rabbits, it is of itself quite sufficient, having only to be unrolled and attached, with small wire sent for that purpose, to wooden stakes driven into the ground, about every six or seven feet apart. It is, besides, peculiarly adapted for rendering Hedges, Paling, or other existing Fences, *completely impervious* to such vermin; and by being cut up into small pieces of three or more feet, as required, it forms a most efficient guard, at little expense, for individual Plants and Shrubs.

PRICES.—18 ins. high, 9d.; 24 ins., 1s.; 30 ins., 1s. 3d.; and 36 ins., 1s. 6d. per lineal yard.

Or a web of 100 yards, 18 ins. wide, will cost ..	£3 15 0
Do. of 100 yards, 24 ins. wide	5 0 0
Do. of 100 yards, 30 ins. wide	6 5 0
Do. of 100 yards, 36 ins. wide	7 10 0

If more or less than a web is required, it would be charged at the same rate per yard.

This Netting is also admirably adapted for Pheasantries and Poultry-yards, and is charged at the same rate. As carriage has, in many instances, been an obstacle to parties at a distance requiring this Net, C. D. Y. and Co. have made arrangements by which they will undertake to deliver it at any of the principal ports of Scotland, England, and Ireland, for One Halfpenny per lineal yard.

C. D. YOUNG and Co. cannot give a better idea of the great strength of their Premium Wire Netting than by stating that the weight of one yard of their 24-inch at 1s. is equal to 2½ yards of another article in the market, the same width, at 9d. per yard. Samples for inspection sent free of expense.

C. D. YOUNG & Co. manufacture every description of IRON and WIRE WORK required for this and foreign countries.

Workmen sent to all parts of Scotland, England, and Ireland.

GRAPE VINES IN POTS FOR FORCING.

J. WEEKS AND CO., King's-road, Chelsea, beg to call attention to their splendid collection of Grape Vines, all struck from eyes, now two and three years old, the finest Plants that have ever been offered for Sale, consisting of 60 varieties, all of the best sorts, warranted true.

THE HAMBURGHS AND MUSCADINES being the best for early forcing in pots, this is the best time for Gardeners to have them, so as to get the eyes ripe and prominent. This Nursery is well worthy of a visit, as all modern Horticultural improvements are in full operation.

J. WEEKS and Co., King's-road, Chelsea.

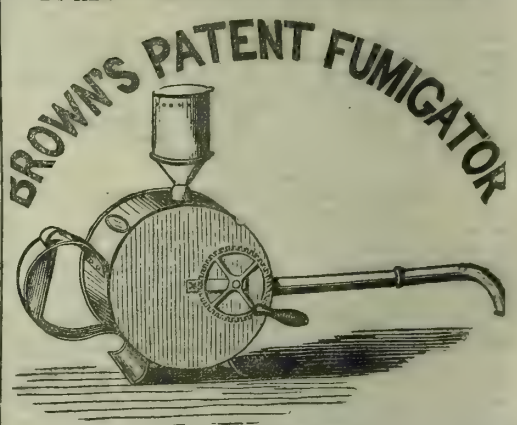
FOR WATERING GARDENS, BREWERS' USE, &c.
FLEXIBLE INDIA-RUBBER HOSE PIPES.

JAMES LYNE HANCOCK, Sole Licensee and Manufacturer of the PATENT VULCANISED INDIA-RUBBER PIPES and TUBING.

These Pipes are well adapted for Watering Gardens, conveying Liquid Manure, racking Beer and Cider, Gas Fittings, Chemical and all purposes where a perfectly sound WATER-PROOF and FLEXIBLE PIPE is required.

Hot Liquors or Acids do not injure them. No oil or dressing is required in using them. They do not leak from remaining out of use, are permanently Flexible in all Temperatures, and are therefore particularly suitable for Fire Engines; and, from their not leaking, are found exceedingly useful in conveying hot or cold water to baths in dwelling houses and such like purposes.

A LIGHT VULCANISED INDIA-RUBBER HOSE is now manufactured for conducting Water and Fluids, at the following prices per foot:



Size.	¼ in.	⅜ in.	½ in.	1 in.	1½ in.	2 in.	2½ in.	3 in.
1 ply ...	0s. 5d.	0s. 6d.	0s. 8d.	0s 10d.	1s. 0d.	1s. 2d.	1s. 4d.	1s. 6d.
2 ply ...	0 8	0 9	1 0	1 2	1 5	1 8	2 0	2 3
3 ply ...	0 11	1 0	1 3	1 6	1 10	2 2	2 9	3 3

N.B. Vulcanised India-Rubber Garden Hose fitted with roses, jets, and branches, complete, with union joints ready to attach to pumps or water cisterns.

All orders or letters addressed to J. L. HANCOCK, at the Manufactory (and Warehouse), Goswell-mews, Goswell-road, London, will meet with immediate attention.

THE HIPPOPOTAMUS presented by H. H. the Viceroy of Egypt to the Zoological Society of London, is exhibited daily from One to Six o'clock, at their Gardens in the Regent's Park. The Band of the First Life Guards will perform, by permission of Colonel Hall, every Saturday, at Four o'clock. Admission One Shilling, on Mondays Sixpence.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

Price 10s. and upwards.

A PORTABLE INSTRUMENT FOR FUMIGATING GREENHOUSES, STOVES, AND FRAMES, or Shrubs and Flowers, in the open air, without injuring the most delicate plant; delivering the smoke cool, in a dense mass, and effecting a great saving of Tobacco.

Manufactured and supplied to the Trade by Messrs. BARBER and GROOM, London; and in Brass by Mr. GOGERTY, 72, Fleet-street; and may be had of all Ironmongers, Seedsmen, and Florists.

TO BE DISPOSED OF, A NURSERY AND SEED BUSINESS, situated in a large provincial Town, doing a good and profitable trade, and which, with a little exertion, may be greatly increased. A better opportunity to a person wishing to prosecute a Business of this description is seldom to be met with. The business has been established for about 14 years. The Seed Shop is in a first-rate locality and well adapted for the Trade; the Stock in this department is at present very small, and generally of the most choice description. About 5 acres of Nursery, in lease, to run five years, and which may be renewed, at a moderate rent, is well stocked with Forest and Fruit Trees, Shrubs, and Plants. The Dwelling-house is comfortably situated, about two miles in the country, with about an acre of ground, which, with Greenhouses, &c., and offices, belongs to the Advertiser, and may be either let or sold. The whole will be given at a valuation, to be made by parties mutually chosen.—Application to be made by letter, post-paid, addressed D., to be left at 28, Edgeware-road, London.

ESSEX.—TO NURSERYMEN, HORTICULTURISTS, FLORISTS, AND MARKET GARDENERS.

TO BE LET, with immediate possession, the singularly desirable Estate known as GLAZENWOOD, for many years occupied by Mr. CURTIS, and situate near to the towns of Braintree and Coggeshall, and within 2½ miles of a Railway Station. It comprises a Villa Residence, a commodious Messuage, large Conservatory, Counting-house, Barn, Fruit-rooms, Stable, and other convenient Buildings, with about 45 acres of superior Land, of which 10 acres, or thereabouts, form the celebrated American Gardens and Nursery Grounds; the remainder is chiefly planted with the choicest Fruit-trees; and the whole abounds with choice Stock in every variety, for which these grounds have for so many years been so justly celebrated.—For rent and other particulars, apply to Messrs. BEAUMONT and THOMPSON, 19, Lincoln's-inn-Fields, London; or to Messrs. COOK and SONS, Land Agents and Auctioneers, Stratford St. Mary, Suffolk.

ASHBY'S INDIA EXPORT PALE ALE.—London Stores, under the South-Western Railway Terminus, Waterloo-road. India Pale Ale, 21s., 18 gallons; 10s. 6d., 9 gallons; Family Ale, 16s., 18 gallons.—CHAS. ASHBY and Co. invite the particular attention of private Families and Clubs to their PALE ALE, as brewed by them for the COLONIAL MARKETS for the past 20 years. Supplied in small casks direct from the Brewery, Staines, and the London Stores, or from their agents—Messrs. W. Hancock, 80, Connaught-terrace, Hyde-park; Chidell and Stewart, 40, Lime-street, City; W. H. Chaplin, 11, Sebbon's-buildings, Upper-street, Islington; J. Shenton, Greenwich; W. Ferguson, Reading; Thos. Berry, Brighton and Lewes; A. J. Richardson and Co., Portsea and Southsea; J. Skidmore, Rickmansworth; Cookey, Brothers, Southampton.

MESSRS. STANDISH AND NOBLE'S new descriptive CATALOGUE OF SELECT HARDY ORNAMENTAL PLANTS is just published, and may be had for four postage stamps. Besides a Treatise on the cultivation of American Plants, it contains a Plate and Description of the Funebral Cypress, Notices of Cephalotaxis Fortunii, Cryptomeria japonica, Quercus sclerophylla and inversa, Viburnum plicatum and macrocephalum, with many recent introductions from the north of China, quite new to English gardens.

Messrs. S. and N. take this opportunity of stating that they give Designs for Laying out New Grounds and Plans for Improvements; also Estimates for all kinds of Planting, whether ornamental or economic.—Bagshot Nurseries, July 27.

MESSRS. KNIGHT AND PERRY feel themselves called upon to thank their numerous patrons very gratefully for the confidence with which they have recurred to them when in want of Gardeners, and beg respectfully to say that the scrutiny and vigilance they have always employed in selecting good and clever men (to which the almost invariable satisfaction that has so long attended their recommendations is mainly attributable) is, if possible, increased now; and the steps they have taken to arrive correctly at the professional and private character of those they send out as GARDENERS, FORESTERS, BAILIFFS, &c., induce them to undertake unhesitatingly to furnish first-rate men in these capacities whenever called on to do so.
EXOTIC NURSERY, KING'S ROAD, CHELSEA, LONDON.

NEW LATE STRAWBERRY,
WILMOT'S "PRINCE ARTHUR."

J. WILMOT, in offering this new variety of STRAWBERRY to the Public, is confident that it combines qualities which no other kind at present in cultivation does possess, being of delicious flavour, and coming in after the principal Strawberry season is over. It possesses the property of firmness of texture, so that it may be transmitted to any part of the kingdom without sustaining injury, as it may be kept for several days after being gathered, when fully ripe, without any indication of decay or loss of flavour.

"Prince Arthur" is one of the largest sized Strawberries, and a most abundant bearer; the foliage is small, and never exceeds 6 inches in height; the fruit is consequently fully exposed to the sun. Its dwarf habit requires it to be planted not more than a foot apart. The fruit is perfectly formed, of a rich scarlet, and colouring equally all over the berry. If planted at the distance recommended it will produce double the weight per acre of any other variety.

Strong plants will be ready for sale in September next, at 5*l.* per 100, on prepaid application only, to JOHN WILMOT, Isleworth, Middlesex; Robert Glendinning, Chiswick Nursery; William T. Atwood, Mortlake, Surrey; George Charlwood, Seedsman, Covent-garden; and Messrs. Hurst and M'Mullen, 6, Leadenhall-street, London.—Isleworth, Middlesex, July 27.

BECK'S SEEDLING PELARGONIUMS of 1849. For prepayment only, the first remittance to secure the first selection. Post-office orders are requested to be made payable at Brentford.

ROSA.—A bright rose-coloured flower of great smoothness and good form, a free bloomer, constant, and of excellent habit. Will prove a first-rate variety for all purposes. 30*s.*

MAJOR DOMO.—A very large rose-coloured flower, with dark clouded top petals; some of the blooms here measure 3 inches in circumference; free bloomer, and of strong habit. 21*s.*

SILK MERCER.—A very close compact-growing variety, free bloomer, and very constant; smooth silky flower of first-rate quality, ground colour rose, with deep maroon blotch on the upper petals. 21*s.*

PRINCE ARTHUR.—A medium-sized flower of excellent quality, very constant, and a free bloomer; rosy crimson ground colour, with dark well defined blotch on the upper petals, leaving a bright distinct margin; light centre. 21*s.*

DIANA.—This is very similar to Rosalind, but larger, and is at its best early in the season, whilst the latter variety is not at its best until quite late. 15*s.*

TYRIAN QUEEN.—If the large deep mulberry-coloured top petals of the flower had been matched with as good lower ones, it would have been first-rate; strong robust habit, and a free bloomer; a very distinct and constant variety. 15*s.*

Many other Seedlings might have been selected, such as "Little but Good," and others, but they have exhibited faults which make it necessary to try them another season. Incomparable will not be sent out until 1851. At present it is unequalled.

VARIETIES OF 1848.

CUYP.—A novel claret-coloured flower; soft, silky, cloudy blotch on upper petals, shading off to the margin; very free bloomer and constant. 10*s.* 6*d.*

EMILY.—A very fine large Centurion flower, of first-rate character for the home or exhibition stages, being a very free bloomer; quite constant, and of good habit. 10*s.* 6*d.*

GOVERNOR.—A must profuse bloomer, of a rich glowing purple, stiff in the petals, and well adapted for all purposes. Good habit and foliage. 10*s.* 6*d.*

LOVELINESS.—A striking flower, of excellent quality; a rose-coloured clean distinct crimson spot on the bottom petals gives it a decided and pure white eye, upper petals rich dark spot extending evenly upwards, and abruptly shading off into the edge; habit excellent. 10*s.* 6*d.*

PAINTER.—Novel and striking, from the great amount of colour on the lower as well as on the top petals; very free bloomer, and constant. 10*s.* 6*d.*

PET.—A middle-sized, stiff, smooth flower, of high quality; rich, dense, even-coloured top petals, with a very light and well defined edge, white eye, and pale rose lower petals; moderate bloomer and constant. 10*s.* 6*d.*

ROSALIND.—A large-sized fresh-coloured flower, a glowing crimson upper petal, with dark blotch; a large white centre, and lower petals light rose; free bloomer, constant, and good habit. 10*s.* 6*d.*

Foster's Gipsy Bride and Constance, 10*s.* 6*d.* each.
Foquett's Magnificent, 10*s.* 6*d.*; and Symonds' Field Marshal, 10*s.* 6*d.*

OLDER VARIETIES, AND OTHER RAISERS' FLOWERS

Twelve of the following varieties, including the box and carriage to London, will be sent out in October, for Two Guineas, well rooted in 3-inch pots, and ready for an immediate shift into a larger size:—Blanche, Centurion, Cassandra, Crusader, Delicatissima, Dorcas, Emilia, Gustavus, Gulielma, Lalla Rookh, Lamartine, Mont Blanc, Meleager, Minna, Ondine, Princess, Alonzo, Ruby, Rosamond, Star, and Symmetry.

Any twelve of the above are fit to compete at any exhibition, metropolitan or provincial. J. Dobson has invariably taken the first prizes at the great metropolitan exhibitions with the sorts herein advertised.

N.B.—Catalogues can be had on application.
Worton Cottage, Isleworth, Middlesex.

HOTHOUSES AND CONSERVATORIES made and fixed complete in all parts of the Kingdom, at a considerable reduction. One, two, and three-light Cucumber and Melon Boxes and Lights of all sizes, kept ready for use, packed, and sent to all parts of the Kingdom; warranted best material. Garden-lights of every description, at JAMES WATTS', Hothouse Builder, Claremont-place, Old Kent-road. Reference may be had to the Nobility, Gentry, and the Trade, in most of the counties in England.

EDWARD BECK, SLATE WORKS, ISLEWORTH.
SLATE CISTERNS, &c.; COLE'S PATENT.

E. BECK informs Horticulturists and the Public generally that Mr. COLE has granted him the use of his Patent for the unexpired term, and he is now able to supply SLATE CISTERNS fastened without iron bolts or the usual oil cement, thereby doing away with the difficulty which has hitherto existed of forwarding such articles by rail or waggon, fixed and ready for use instead of in pieces, as heretofore.

E. B. will be happy to answer any inquiries as to the price of Cisterns, or any other Slate articles manufactured by him, such as Orange Tubs, Plant Boxes, Tanks, Shelves, Garden-path Edging, Hot-water Tank Covers, Flower Boxes for Balconies, Shelves fitted to hold water for Orchidaceous Houses, &c., all of which may be seen in use at Worton Cottage, Isleworth, on application to the Gardener, Sundays excepted.

Estimates given for Work as shown upon Drawings, and in specifications. A large stock of Slate Slabs of all sizes and thicknesses, kept on sale.

N.B.—Dairies fitted either with Shelves or Milk Pans, of very neat appearance.

PIMLICO SLATE WORKS. — Cisterns, Filters, Milk and Salting vessels, Corn and Flour Chests, Sinks, Dairy and Larder Shelves, Malting and other Flooring, Skirting, Refrigerators, Garden Edging, Flower Boxes, Pine pit Linings, Hot-bed Frames, moveable Cattle Sheds, Coping, Drain Stones and Traps, Steps and Risers, Balcony Landings, Roofing Slates, ridge roll and flap; Waste Slate for drains, Sun Dials, Fountains, and all descriptions of plain Slate Work in Town, or direct from Mr. MAGNUS'S Works in North Wales.

ENAMELLED SLATE Chimney-pieces, Billiard Tables, Console and other Table Tops, Mural Tablets, &c., in imitation of marble, surpassing the choicest marbles in beauty and durability, at less than half the cost of the commonest descriptions. Price Lists forwarded on application to Mr. MAGNUS, 39 and 40, Upper Belgrave-place, London.

BAKER'S PHEASANTRY, Beaufort-street, King's-road, Chelsea, by special appointment to her Majesty and H. R. H. Prince Albert.—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shovellers, gold-eyed and dun divers, Carolina ducks, &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied, and common pea-fowl, and pure China pigs; and at 3, Half-moon-passage, Gracechurch-street.

STATUES, VASES, FOUNTAINS, GARDEN ORNAMENTS, Coats of Arms, and Architectural Embellishments in Imperishable Stone, by VAUGHAN AND CO., 60, Stones-end Borough, London. T. J. CROGGON, late of COADE'S, Superintendent.

The Gardeners' Chronicle.
SATURDAY, JULY 27, 1850.

MEETINGS FOR THE ENSUING WEEK.

WEDNESDAY, July 31—Royal Botanic ..... 3*h* P.M.
COUNTRY SHOWS.—Wednesday, July 31: Glasgow and West of Scotland Horticultural, Derby Midland Horticultural, and Jersey Horticultural.—Friday, Aug. 2: Darlington Horticultural.

WHEN we drew attention, a few weeks since, to the state of BOTANICAL NOMENCLATURE, we suggested that our readers should favour us with their opinions upon the propriety of making some changes in it. We did so, not from entertaining the least doubt as to what the right course is, but for the sake of eliciting such expressions of opinion as would put us in possession of the views of those who are alone interested in the question. So far as mere technical science is concerned, the language of botany is good enough; for botanists understand it. The real question at issue is, whether it is adapted to familiar use? and, if not, whether it cannot be so adapted without any violent interference with usage or scientific convenience? Very few men are or can be professed botanists; multitudes wish for such an acquaintance with botany as an important and highly interesting branch of science demands of the well informed; and there is a very large class of persons whose pursuits compel them to talk in the language peculiar to it. But this language is entirely foreign to English ears and English taste—uncouth, inelegant, and even barbarous. To remedy this, and to place it in such a condition that it may be an object of attraction to the educated multitude, as well as to a few studious philosophers, has for many years been the aim of ourselves and others. Nor has our motive been even limited thus narrowly; on the contrary, we believe that it and other branches of natural history may be made a valuable part of a villager's education; but, if that is to happen, natural history must wear an English dress. If it be of no importance to any one beyond the unlearned that plants should have English names, it is to THEM; and for them, at least, the battle is worth fighting.

Some perception of this necessity has evidently been felt, though unconsciously, even by those among whom are to be found the most uncompromising opponents of an English terminology. *Dicotyledones*, *Exogenæ*, *Cryptogamæ*, have already settled down as Dicotyledons, Exogens, and Cryptogams; just as *Mollusca*, *Pachydermata*, and *Mammalia* have become Mollusks, Pachyderms, and Mammals. Men now talk of Conifers instead of *Coniferæ*, and of Orchids instead of *Orchidaceæ* or *Orchideæ*. It is clear, therefore, that the current of opinion is setting steadily in a better direction; and there is no reason why it should move so slowly.

The view of this question taken by "Nomenclator," p. 421, will probably prove to be the most generally acceptable. In the main he agrees with ourselves; but he pushes his fear of translated names much further. Conceding, as we fully do, that to translate into English the technical names of genera is upon the whole inexpedient as a rule, and to be avoided where possible, we cannot admit that the objection to it rests upon any other ground than that of inconvenience. English compound names are as fit for scientific purposes as Greek and Latin ones; but they cannot form part of that universal language which the convenience of science requires; and therefore they are inadmissible when foreigners have to be communicated with; and moreover, as we have already stated, they entail upon men of science the necessity of remembering two names instead of one, which is inconvenient when some hundred thousand such names have to be recollected. These are weighty reasons, and we admit their force: but we recognise no other reason. "Nomenclator's" translation of MOTH-FACE is surely as agreeable a name as *Phalænopsis*; although MOTH-ORCHIS would have been better; and we see little force in Mr. OWEN's objections, if resting upon no better ground than a bungling *mis*-translation of *Dendrodus* into SHRUB-TOOTH. We may laugh at the absurdity, just as we should at translating *Oncidium cæcum* into BLIND HOOKEY, as a facetious friend suggests; but such follies can form no part of a serious argument. We repeat, then, that we give up the translation of scientific *proper* names, because of the inconvenience, and for no other reason.

That is, however, no reason why we should not employ pure English names wherever we can without incurring that inconvenience; and we decline to acknowledge the propriety of calling a *Quercus* or a *Fagus* by any other name than those of Oak and Beech. *Bellis* must be Daisy, *Delphinium* Larkspur, *Aconitum* Monkshood, *Ranunculus* Crowfoot, *Juglans* Walnut, *Carya* Hickory, and *Taraxacum* Dandelion, as long as the English tongue endures; and foreigners must learn the meaning of such words just as they learn the meaning of other words. It is quite as reasonable for us to say to a foreigner, "you, for *our* convenience, must learn that Willow is the English for *Salix*," as for him to say that we must know *Salix* to be the Latin of Willow for *his* convenience. And since Prof. OWEN's authority has been introduced into the question, we must add that we claim him for a good witness on our own side. Let any one turn over the pages of his beautiful work on fossil reptiles, and see how sedulously he shuns the hard words of technical science wherever he can. He talks of the Gavial, the African Constrictor, Tiger-boa, Sea-snake, and common Snake, and not of *Gavialis Dixoni*, *Python regius*, *Python tigris*, *Hydrophis bicolor*, or *Coluber natrix*. Every one must, we think, desire that he had carried this further—substituting snakestone for ophiolite, and so on.

We remark that one of our correspondents is alarmed lest his Crocuses should degenerate into Crokes, and therefore he would compel people to go on for ever breaking their teeth against the angles of our Græco-Latin compounds. But his fears are groundless; Crocus is a name not likely to be disturbed; and if it were, the change would not be more disastrous than that of Hyacinthuses into Hyacinths. In spite therefore of this warning, we venture to recommend that on all possible occasions the technical proper names of science be adapted to our own tongue, where familiar names do not exist. It will be found an important means of diffusing a taste for natural history, and need not shock the sensibilities of the most tight-laced stickler for scientific formalism. Calycanths are as good as Calycanth*uses*, Hyacinths as Hyacinth*uses*, Perymenes as Perymen*iums*, and Glossocards as Glossocard*ias*.

But while we recommend the abandonment of translations of technical proper names, we must insist upon what is the greatest point of all, the translation, wherever possible, of the adjectives used in the binomial system, and of all adjective terms whatsoever, for which English equivalents can be found. This is however opening a new and perfectly distinct question, for which we must crave a second hearing.

As we have already said, we do not at present see any such symptoms of an approaching POTATO ROT as would justify serious apprehensions. Loss there will be, of course; but we hope to no such extent as will deserve the name of a national calamity. The rumours in the daily papers are certainly to be listened to with caution; yet they are too numerous to be disregarded, especially when connected with the certain knowledge which we do possess of the blight having reappeared.

From the neighbourhood of Paignton a correspondent writes—"I regret to inform you that the Potato disease is rapidly increasing in this neighbourhood; as yet, mine, comprising about 2 acres, are uninfected, but as soon as it appears I have given instructions to have all the stalks pulled up, and the roots earthed up. The year before last I adopted this plan, with alternate rows, as an experiment. When the roots

were taken up two-thirds of the pulled were saved, whilst of the un-pulled two-thirds were rotten." Another from Launceston writes—"The Potato blight appeared in this neighbourhood on the 21st inst., the leaves on isolated patches of the late sorts being blotched and withered, though I cannot discover any disease in the tuber. It is curious that the leaves of an Apple tree and the flower of a Cabbage plant are completely withered in the line of blight which has passed over my Potatoes. The disease cannot be attributed to damp, as the ground is completely parched, and much in want of rain. In the evening, when the dew has fallen, the smell of the Potato blight is very strong in passing near fields where that crop is grown." A third, from Whiteford, sends up decaying tubers, with the melancholy intelligence that in all the low and wet places the disease is making alarming progress. We mentioned, a few weeks since, that mischief was showing itself near Kenmare, and elsewhere in Ireland, and we are now able to add that it has appeared in Westmeath, where much alarm is felt.

We do not, however, believe that as yet the injury is serious, and we have much confidence in the effect of early planting and dry ground. Nevertheless it is to be feared that if the autumn be wet, as is probable, the cultivators of the Potato on a large scale will have once more to sorrow over their folly.

ON THE VINES OF HUNGARY.

From the "Ampélographie Universelle ou Traité des Cépages;" by the Comte Odart; 1849.

In treating of the varieties of Vines cultivated in the kingdom of Hungary, it is proposed to notice, in the first place, those in the vineyards of Hegy-Allya, words signifying the "Foot of the Mountains," the wine from which is sold under the name of Tokay. But the Tokay mountain forms but one of a chain, and produces only a small portion of the wine called Tokay. Those of Mada and Tarczal, where the two best vineyards belonging to the Emperor are situated, not only equal Tokay as regards produce, but they even exceed it. It is erroneous to suppose that the Tokay wine is high-priced on account of its rarity, or that the vineyards which produce it are not larger than that of the Schloss Vougeot, or the small vineyard of Constance. On the contrary, they extend over 60 square miles of surface, or an area of 38,000 acres, and include about the third of the superficies of 34 mountains, situated in the district of Zemplén. Tokay is the first of this chain.

There is, however, a considerable difference in the wines produced even on Tokay itself. Those Vines which grow at an intermediate station on the sides of the mountains affords the best wine. The quality of the produce of the imperial Vines on Mount Tarczal is so excellent that it has received the name of *Mezes-male* or Honey-comb; and this is owing to situation and to the proper combination of the different kinds of Grapes. Tokay is situated in lat. 48°10′.

The Hungarian author Szirmai, of Zirma, enumerates 30 kinds of Vines, and says he knows 60 that are cultivated in the district of Zemplén. I shall, however, notice those only which appeared to me worthy of being introduced to France on account of the influence which they have on the quality of the wine, in the part of the mountains called Hegy-Allya.

The Furmint, to which they sometimes prefix the words *Nagy-Szemü*, large-berried, deserves to be regarded as the principal variety. Furmint is the name by which it is best known in the Hegy-Allya. It bears also that of *Szigethy-Szoello* in the district of Weszprim; of *Zapfner* in the vineyards of Rust and Oedenburg; and the *Mosler Traube* in Styria. The name of Furmint, according to the Hungarian author above cited, comes from *foro minucii*; but the academic society of Debreczin derives it from the region Formiæ, resting doubtless on the passage of Horace: "Mea nec Falernæ temperant vites, neque *Formiani* pocula colles."

This valuable Grape was brought to France in the beginning of the present century by M. Villerase, and cultivated successfully in the vineyards of Béziers; and about the same time, or soon after, it was sent by Gen. Maureilhan into the department of L'Herault. Its cultivation spread rapidly in many localities in the south of France.

Shoots strong, short-jointed, and generally erect, the lower part grey, the upper of a rufous yellow, streaked with brown. Leaves generally entire, sometimes slightly three-lobed, broader across than from base to apex, deep green on the upper side, very downy on the under, with prominent veins. Bunches of medium length, more cylindric than conical. Berries somewhat loose, and very unequal, many being abortive, 6—7-tenths of an inch in diameter. At maturity they are full of a very sweet juice: but the flavour is not such as to render them worthy of esteem for dessert; and I have never seen them employed as such in any part of Hungary. Some berries ripen towards the end of August in the Hérault and Gard, and the whole of the bunches are ripe in the beginning of October; but at the foot of the Hungarian mountains they are only gathered in the end of October, or first week of November. Many of the berries become half dry, somewhat like Raisins, on the plant. M. Baumes ascribes this to the punctures of wasps and bees, for which this variety of Grape has a great attraction. The proportion of these half-dried berries, *trockenbeeren* of the Germans, is from one-fourth to one-third in the canton of St. Gilles, Gard; but it was much less in the vintages where I have assisted in the Hegy-Allya.

There is a variety of Furmint, but it is not so much esteemed as that sort, because none of its berries dry like Raisins. It is called the Madarkas-Furmint, or *Bird Furmint*. It is also known under the name of *Holy-Agos*. The birds, more especially the thrushes, are very fond of this Grape, the berries of which have a honied sweetness.

Fehér-Gohér, or Fejér-Gojer; both are pronounced *Faïr-goïr*, and signifies (Fair-early) *early white*. This is cultivated for an early vintage. Its bunches are long, with oval berries, thinly disposed; they are much better to eat than those of the Furmint.

Hars Levelu, *Lime-tree-leaved*.—The bunches are very long, almost cylindrical, furnished with round berries, the juice of which is very sweet. The wood of this variety is easily recognised in winter by its smooth, red epidermis.

Belafant bears considerable resemblance to the preceding in the general appearance of the bunches. The berries are very round, yellow, thinly set, and so transparent that at their complete maturity one might count the seeds. The shoots are vigorous; leaves entire, thick, very broad, downy beneath, but less so than those of the Furmint.

Fejér Szoello, *White Grape*.—This is cultivated to a considerable extent, perhaps too much so in the Hegy-Allya. It is very fertile, and although the berries do not dry, yet the juice is turned to account for mixing with that of other kinds. It is easily recognised among others by its abundant bloom, the berries appearing as if they had been thickly powdered over. It is prudent to eat this with reserve, for it is very relaxing; it is, however, no great privation to refrain, as its quality as a table fruit is only indifferent. I suspect it is not good for wine, for the common wines are generally bad, and this variety being in greater quantity than all the others, probably a large share of deleterious influence is attributable to it.

Narankas, *Leany-Szoello Nagy-Szemu*, and *Kisseb-Szemu Leany-Szoello*; that is to say, *Raisin des filles à gros grains, et à petit grains*.—These are also very commonly to be met with among the Vines in Hungary. They are vigorous, and produce handsome bunches, with oval berries. The variety with small berries have these of a more yellow colour than those of the Nagy-Szemu. They form but a very small proportion of the Vines cultivated in this region.

Barat-Tzin Szoello. *Raisin couleur de Robe de Moine*. It is also the *Klein Roth Szirifandl* of Rust; and the *Rother Tokayer* of the Rhine districts.—Bunch small; berries round, grizzly, or of a colour between grey and red. Although it is called the Rother Tokayer, red Tokay, I believe it is but little cultivated in the vineyards on that mountain. It is more abundant in those of Rust, in the district of Oedenburgh.

Muscataly, in some districts *Fejér-Denka*.—[This is allowed by various good authors to be the same as the white Frontignan; but the Comte Odart thought it less vigorous than that sort. Berries smaller and not so close. All this, however, may have been owing to the condition of the plant.]

The Muscat wines of Hegy-Allya are very different from those of the south of France. They are highly perfumed, containing much spirit, but they are very dry. The best use that can be made of the Muscataly Grapes is to put a small quantity of them along with the vintage of other varieties, to the wine of which they communicate an agreeable bouquet. There is a red variety of Muscat very common in the vineyards of Magyarath, under the name of

Voros-Denka, *Red Muscat*. It produces an esteemed wine, but not having brought the plants from Hungary, I cannot say whether it is exactly the same as the Muscat rouge. [The latter is the red Frontignan of the English gardens.]

There are some inferior varieties occasionally to be met with, which ought to be extirpated, because of their unfavourable influence on the produce of the sorts already mentioned. Among those which I have observed, I may mention the six following sorts: Peytres Selymes Szoello, the Peter Silien Traube of the Germans, the Parsley-leaved of the English, and the little esteemed Ciotat or Raisin d'Autriche of the French; the Fejér-Gerset; the Kiraly Edes, or Doux Royal; the Sar Dovany; the Demjeny; the Rosas-Szoello, or rose-coloured Grape.

Besides the vineyards of the Hegy-Allya, there are others which have considerable reputation, not only in Hungary but also in Germany. For example, in the district of Bihar they make a white wine, which we find on the best tables of Pesth and Vienna under the name of Bakator, from a wine so called, and which has also the name of *Alfoldy* in the country beyond the Theiss. Berries ovate, frequently elliptic or oblong, yellowish-white, very fleshy, but juicy notwithstanding.

Granat Tzin Bakator is of a granite red, as its name implies. The leaves are much cut, downy beneath. Bunch not large; berries loose, round; their red colour changes to violet at complete maturity; too late for the climate of France.

The district of Komorn, where the remarkable vineyard of Neszmély is situated, near the right bank of the Danube, affords some valuable varieties, at the head of which we ought to place the

Sar-Fejér Szoello.—This does not probably exist in the vineyards of Tokay, because it ripens fully a month earlier than those generally cultivated there; but it is very common, and much esteemed, in the Vineyards situated near the Balaton Lake, in those of Schomlan, Gyon-Gyos, and more especially in those of Neszmély in the district of Komorn. It resembles the Burgundy White Cluster, but the berries are somewhat oblong, and smaller than those of the sort just named.

Hamvas-Szoello, Ash-grey, *Grau-Tokayer* of some Alsaciens. Resembles the Grey Burgundy.

Budai Fejér, at Neszmély; *Weiss Honigler Traube*; *Bela Orkugla Ranka*, early round white; *Fruh Weiss Magdalenen*, of many German vineyards.—Grown in a good soil the wine of this variety is said to rival that of the Muscat, as regards its bouquet and aromatic flavour.

Szold Szoello, green Grape; *Szemendrianer Magyarka*, in the Banat; *Welika Szelena* or *Szelenika*, in Sirmia.—Its berries are very large, oval, of a green colour. The juice is abundant and sweet, but of only moderate flavour. It ripens late, yet it is esteemed, because it resists the autumn rains.

When we have named the *Bela Slakamenka*, the *Bela Kadarkas*, the *Modu* or *Juh Farka*, which is the *Langstaengler* of the Germans, we think the best white wine Grapes have been enumerated.

Black Grapes employed for the Fabrication of Red Wines.—When in Hungary, I preferred the red to the white wines, both as regards the *vins ordinaire* and *vins de liqueur*. They are not, however, equal to our best French wines. The common wines of Hungary are very heating; they will bear no comparison with our Burgundies. I shall only notice one red *vin de liqueur*, the most distinguished of all, although unknown in France. It is a wine produced by the vineyards adjoining a small town called Menes (pronounced Menesch). It is less spirituous than the old Tokay, but richer in bouquet and juice. They make it also in Sirmia, and in the vineyards of Erlaw and Gysrak. As the same varieties of Grapes serve for the fabrication of both the luscious and common red wines, I shall confine myself to the notice of a few of those the most generally esteemed.

The Kadarkas, to which they often prefix *Cerna* or *Fekete*, the former being the Sclavonian and the latter the Hungarian term for black. It is the *Edel Ungarische Traube* of the Germans; and the *Raisin Noir de Scutari* of some. This is the only variety of black Grape which affords dry or raisined berries, *trockenbeeren*, in Germany. In addition to this valuable property, it has others which concur in rendering it worthy of being placed in the first rank. It communicates a fine colour and an agreeable aroma to the wine made from it. The plants grow rapidly and produce the third year; and this natural productiveness is long maintained. In short, if this Vine, from its precocity, is liable to be slightly affected by the late spring frosts, yet its flowers are hardy, and it fails not to yield a crop. The bunches are large, long, cylindrical, rather loose; berries middle-sized, black, ripening early in Hungary. Its leaves are of a deep green above, for the most part entire, but some have the lobes well marked; the undersides are cottony. The vintage of the Kadarkas Grape forms three-fourths of the composition of the Menes wine. The vineyard is situated on the lower part of the promontory of a branch of the Carpathian chain, in the district of Arad. The soil is argillaceous, of a brownish red colour, and mixed with gravel. In some instances the clay is yellowish, and then it contains less gravel.

Torok Goher. *Nagy Szemu Fekete*, *Frühe Turkische*.—The first and third of these are the Hungarian and German words for "early Turkish;" the other signifies "large-berried black." Next to the Kadarkas, this is the most esteemed in the principal vineyards for red wine in Hungary, especially those of Gyon-Gyos. Its leaves are broader, rounder in the outline, and more obtusely dentate, than those of the Kadarkas. The young shoots are reddish brown; bunch conical, loose, shouldered, and not so long as the preceding variety, but the berries are much larger, of a round form, with very succulent and rather coarse flesh.

Purcin, Upper Hungary; *Fekete Vilagos*, in the district of Szalader; *Kleine Schwaze*, of Ofen.—The bunches have generally small cylindrical shoulders; the berries are small, round, and black; the juice is vinous, and of good colour when the Grapes are well ripened, which is the case every year, although rather late. It is much esteemed in the red-wine vineyards.

Czerna Okrugla Ranka, Black Round Early.—This is the same as the *Auvernat Noir*, the *Pinot*, or *Noirien* of Burgundy. This is cultivated more especially in the vineyards of Sirmia and in the Banat. The red wines of the duchy of Sirmia were reckoned the best in Hungary till the middle of the seventeenth century, when their reputation came to be gradually ceded to the wine of Tokay.

Blauer Auguster (*Blue August*). Bunches loose; berries oval, of a bluish black, with long, slender red pedicels.

I have not mentioned the Vines with the produce of which some proprietors compose a detestable imitation of Champagne, the only point of resemblance being that of a sparkling, of short duration. I had some of it both at Pesth and Vienna, and the taste was horrible. The wine was evidently a fabrication by chemical processes. If the Hungarians wish to make sparkling wines at all comparable with genuine Champagne, they must renounce the proceedings of the chemist, and plant the Black Burgundy Grape (*Morillon noir*, or *Pinot*), not entirely at the foot of their mountains, but on the lower parts, and I doubt not that by admitting *no white*

Grape, and with the assistance of a cooper from Rheims, they would insure a degree of success incomparably greater than that resulting from the almost ridiculous attempts which they have hitherto made. [We should suppose many British colonists would profit by this remark.]

DISEASES OF PLANTS.

(*Concluded from p.* 452.)

Genus IX.; *one species.* Mulberry Murrain.—This disease, which in the last 30 years of the last century carried off so many Mulberry trees in Italy, has been designated by so many different names, that I have preferred giving it the general one of *Mulberry murrain*, laying aside those of *Falchetto, Chancre, Mosca, Salvanello, Dropsy, Moria, Seccherella*, &c. Much has been written upon it, and there is not a cultivator or proprietor who is not well instructed on the points necessary for him to know. But with all that, is it at all decided yet what the disease was? Had it any characters to distinguish it from all the diseases enumerated in this Essay, or is it only the last stage of some one of them? As far as my observation goes, many doubts hang over the question. Without staying to endeavour to solve them, I shall proceed to give the characters of the disease, and the method of cure; premising that its ravages were not confined to the Mulberry grounds beyond the Po, but extended also on this side, and as much on the hills and mountains as in the plains.

The trees attacked commence by turning yellow and sickly. Some young shoots at the top curl up and fall off, especially those turned towards the south and the west. This happens in the months of April, May, and June. "If the affected branch be cut, there will be found between the bark and the woody tissue a black line, which runs down to the main branches, and thence through the trunk to its base. In Mulberry trees along ponds it will always descend into the roots, some of which, corresponding with the black line, will be found to be rotten and decomposed." This disease, during which the trees gradually lose their leaves and branches, is more rapidly fatal and more general in old trees than in young ones; it spares, or only attacks tardily, healthy subjects in their age of vigour. Very young plants are also subject to it much more than when full grown. Amongst other symptoms there is also often a raising of the bark.

Some have been of opinion that over repletion was the cause of the disease, and on that account Cattaneo proposed cauteries; others, with Goffi, would remove the rich soil and substitute a dry barren one; whilst others, again, would attribute the malady to a deficiency of nutriment. The annual stripping of the leaves, especially when repeated a second time, bad cultivation, a bad selection of trees, and especially the vicissitudes of seasons (to which last cause I myself incline, observing the effects of spring frosts on the young shoots), have been severally brought forward as giving rise to the disease. Its real origin has not however yet been ascertained. The reader may refer to what the Abbé Bettolini has written on the subject, in his Memoir inserted in the 20th vol. of the "Opuscoli sulle Scienze e sulle Arti" of Milan, and before him by Dr. Moro, in a paper contained in the 17th vol. of the same collection.

The following are the remedies to be tried for this disease, besides the general preventives derived from good cultivation. The first thing is to ascertain how far the black line descends, and to cut out to the pith all that portion of substance which is tinged with black or brown. The wound should then be filled up with a mixture of cow-dung and clay. This operation should be performed at the end of summer or in the commencement of spring. I prefer this method to all the aspersions with different mixtures which have been proposed, and bear more or less the stamp of quackery. The second course proposed is to cut off the branches or stem as far as the canker appears, or even below it, and to graft the stump in spring. In choosing the grafts, care must be taken to select vigorous ones, and from trees free from the disease. I believe that this or some analogous disease has at various times attacked the Mulberries in Italy. I will leave to those who have more experience to decide the question, whether, as Alberti, Bettoni, and the greater number of authors maintain, wherever a Mulberry tree has died, whatever be the cause of death, no other Mulberry tree will grow, or whether Bettolini is right in denying it. It is true that cultivators in whom one cannot refuse placing some reliance, and all practical men with whom I have spoken on the subject, join in affirming the point.

From the few observations consigned in the present essay, it will be seen how useful may be the study of diseases of plants, founded, however, chiefly on actual observation. I will, therefore, now conclude, by imploring natural philosophers to devote themselves to the subject, not disdaining to call to their assistance practical agriculturists, who, amidst their numerous prejudices, are likely nevertheless to contribute facts which may lead us to ascertain useful truths. The amateur of rural matters who glances over these pages, will often see reason to be convinced of the necessity of preventing evils which though ascribed to climate and meteoric influence, are often the necessary consequence of our ignorance, obstinacy, and idleness.

VILLA AND SUBURBAN GARDENING.

That long-neglected, but in their way really beautiful tribe of plants, called Alpines, deserves the attention of the amateur botanist. The study they afford is extremely interesting and instructive. Gaudy flowers may catch the vulgar eye, but a more refined taste will find in these lowly inhabitants of the hill-side an endless fund of pleasure. Than these no class of plants is so peculiarly eligible for small gardens; they occupy so very little space; a vast number of them may be shown to advantage on rockwork; some few, however, require and deserve to be protected from the winter; not that frost kills them, but they are apt to damp off on account of the humidity of our atmosphere. The native habitats of great numbers of them are on elevated masses of rock, where no stagnation of moisture can exist; they are sometimes found rooted into the crevices of huge blocks of stone, and apparently existing upon the moisture they derive from them; others, as on the Alps, for instance, are covered, and consequently protected from the severity of winter, for six months in the year, by a snowy mantle. These circumstances, therefore, increase the difficulty of keeping alive many of the rare species when transplanted on our rockworks or consigned to the pot in our humid and variable climate.

In order to preserve these interesting plants in health, it is necessary to plant them in poor and dry soil, perfectly drained; the latter item is absolutely necessary with all that are difficult to keep. Numbers of them are found in places where the sun's rays scarcely ever reach; analogous situations must therefore be selected, for such kinds. In preparing rockwork for them, instead of piling up a heap of rich mould, on which fragments of stone are to be placed, I would suggest the propriety of using brick rubbish, or the refuse of old buildings, materials which will allow the rains readily to escape, thus securing a dry and healthy foundation for them. Some prefer cultivating them in pots; and for their proper and better management a pit, with a north aspect, is provided for them, and a very interesting part of the garden it constitutes; for at all seasons some of the kinds are to be found in flower. In potting, great care must be paid to the kind of soil employed with those which are difficult to cultivate. Under such circumstances the drainage may occupy three-parts of the pot; the surface, in all cases, should be covered with a thin layer of coarse sand. It must not be inferred, from what I have said, that gardening skill cannot be brought to bear upon Alpines. The contrary is the fact; for with care and attention no tribe of plants will prove of greater beauty or yield more interest; the cultivator must not, however, apply strong and powerful stimulants; he must rather attend to the nature and habits of the plants individually, and by such careful supervision select proper situations for their growth, and increase the richness of the soil only as sound judgment may warrant, and the case will admit. *Pharo.*

Home Correspondence.

Summer Pruning.—I observe in page 421 an article by Mr. Lovell, avowedly on the summer pruning of the Vine, but really on that of the Peach, and I am of opinion that his remarks should not be allowed to pass unnoticed. He criticises unadvisedly some sensible and practical directions given in your Calendar of Operations for June 22. I hope, however, to show the writer of the Calendar that his directions are clear and intelligible, and duly appreciated by some, however much misapprehended by others. I am further induced to express my coincidence with the ideas of the Calendar writer, as I have seen the system practised successfully by parties whose names would at once stamp it as deserving attention; besides which, my own practical experience has convinced me of its correctness. I must first briefly point out the inapplicability of the Vine and its management, as a general rule, for that of all other fruit trees, and particularly the Peach and Nectarines. This will be seen by considering what is the object aimed at in Vine cultivation, with a view to obtain the desired fertility. Is it not that the wood be of the strongest and most luxuriant growth that can be ripened by sun and air? And as the heaviest bunches and largest berries are produced upon such shoots, it is important that the plant be stimulated by artificial means at root, and that the branches be weakened by stopping as little as possible. Now let us turn to the Peach, and note the difference. It is well known that this fruit and its congeners grow much too gross, even in ordinary soils, without being stimulated; and the moderately weak shoots produce fruit in the greatest abundance. Thus, when compared with the Vine, the case is just *vice versa*, and the course of treatment pursued must differ accordingly. In the management of the Peach, so as to secure fertility, a healthy, moderate growth must be secured, and everything like grossness must be carefully checked, by pinching the shoots at top, and by pruning the roots at bottom. A tree which has grown immoderately strong, during the previous year, should be moderately pruned at the roots in autumn, so as to induce a less exuberant growth in spring, taking care of course not to prune too hard. But winter pruning, though useful to a certain extent, is rarely sufficient; in many soils and situations the roots re-establish themselves so quickly as to make the tree grow too luxuriantly during summer, and to continue growing too late in autumn. These are facts well known, and those who have not found a remedy may thank the writer of the Calendar, and the writer of the Leading Article in your Number for July 6th, for bringing the methods of stopping and summer root pruning before their notice; and those who are already aware of the excellences of these practices, will do well to add their testimony in support of them. To return to the Peach: when the winter root pruning has been omitted, or has not been severe enough to prevent the production of shoots in spring, too strong to be fruitful, it is an excellent practice to stop the strongest of these shoots as soon as they have made five or six leaves, in order that a second series of shoots may be produced, less strong than the first ones; and that by thus equalising the flow of sap, all the shoots on the same tree may be brought more on a par one with another. When the habit of the tree is very gross, it is necessary to repeat the process more than once, with a view to produce healthy bearing wood. With our short summers and wet autumns, it becomes absolutely necessary, in very many situations, to stop the shoots after they have attained to a certain length, in order that the wood may be thoroughly ripened, and the energies of the tree directed to the formation of blossom-buds. And here, also, I must express my coincidence with the practice recommended June 22, of leaving a lateral at the point to secure an escape for the superabundant sap. But when the trees are very luxuriant they are liable, when stopped in summer, to expand too many of their buds in the production of laterals, and to prevent this it is an excellent practice to prune the roots simultaneously with the last-mentioned stopping of the shoots. *Lumbricus, Salop.* [We perfectly agree with the writer of this letter. The Calendar is right, as it always is in matters of practice.]——Permit me to say that Mr. Toogood's letter has occasioned me regret on two points; first, because he was angry when he wrote it; and secondly, because he failed to understand the principles, or rather the application of principles, alluded to in my former communication. He has wholly misinterpreted my views, and has drawn inferences such as I never dreamt of. My object was to elicit the views of practical men as to the connection between the head and root of a plant under certain stated conditions. He will understand that it is a physiological question bearing directly upon practical horticulture. If he has watched the horticultural press during the last few seasons he will not be at a loss to discover why I introduced the question. Mr. Toogood is somewhat singular in his mode of drawing inferences, in the present instance they are directly opposed to what was intended. But possibly the construction of my sentences led to the confusion. I must beg to add that I am an advocate for summer pruning as far as practicable, that I—but I need not say more. *George Lovell.*

Botanical Nomenclature.—It would certainly be a great advantage to persons who are fond of horticulture, if the names of plants could be simplified. Many who have not had opportunities of keeping up their Latin and Greek, are sadly puzzled to comprehend the curious compounds of both languages used in christening the ornaments of our gardens and conservatories. To accuse a man of pedantry because he wishes to retain the present system of botanic freemasonry—or to call his neighbour misty in intellect, because he is an advocate for attempting to render plant names more intelligible, and easier to be remembered—are equally absurd. If it could be done without deranging a whole system, I should certainly give my vote for an alteration in the nomenclature of the plant tribe; yet there are so many difficulties to contend with, it will be almost an impossibility to accomplish any satisfactory change. Was botany confined to a certain district inhabited by individuals speaking the same language, by common consent, particular terms might be substituted for others without causing any great inconvenience; but where the science is universal a tongue must be used which is pretty generally known to all nations professing civilisation. The error seems to be in concocting the most excruciating names, partly from the Latin dictionary, and partly from the Greek lexicon; this is what makes modest men afraid of taking up a delightful study, as they do not wish to become ridiculous by uttering half a dozen false quantities in as many minutes. When even men of education are astounded at the length and breadth of plant language, what must be the case with the usual class of respectable gardeners, men who have some difficulty in compassing their mother tongue? *Falcon.*

Cocoa-nut Sugar.—Ceylon newspapers mention a new source of sugar, as likely to be of importance to that colony. The sugar is obtained by cutting off the Cocoa-nut flower stem, attaching a vessel to it, and evaporating the liquid; it flows over in quantities so great as to be almost incredible, and I have seen samples of the sugar equal to anything ever obtained from the sugar-cane, and produced in such abundance from a tree as to promise immense returns yearly to the owner of it. Would you kindly state your opinion as to the chances of a tree so bled, living in health for any length of time. A Cocoa-nut tree comes to full bearing in seven years, and will continue in vigour for 70 to 100 years in Ceylon, producing from 100 to 300 nuts yearly. I should imagine a tree so tapped would live but a very few years. *J. Mackenzie, M.D., Inverness.* [We do not think that Cocoa-nut trees thus *drained* of their blood, will long remain in health. They will, however, endure tapping in moderation.]

Effect of last Winter on the common Laurel.—In one of the gentlemen's pleasure-grounds where I have attended lately, it was painful to observe the manner in which the common Laurel had suffered from the late severe winter. Those under trees and most sheltered were entirely denuded; and, after inquiring of all the gardeners in the locality, I am unable to learn why they

should have suffered beyond those in open exposures, unless the following is a parallel case, taken from the second volume of White's "Natural History of Selborne," page 90 :—"It was in such an aspect that the snow on the author's evergreens was melted every day, and frozen intensely every night, so that the Laurestines, Bays, Laurels, and Arbutuses, looked in three or four days as if they had been burnt in the fire ; while a neighbour's plantation of the same kind, in a high cold situation, where the snow was never melted at all, remained uninjured. From hence I would infer that it is the repeated melting and freezing of the snow that is so fatal to vegetation, rather than the severity of the cold ; therefore it highly behoves every planter, who wishes to escape the cruel mortification of losing in a few days the labour and hope of years, to bestir himself on such emergencies ; and, if his plantations are small, to avail himself of mats, cloths, Pea-haulm, straw, reeds, or any such covering, for a short time ; or, if his shrubberies are extensive, to see that his people go about with prongs and forks, and carefully dislodge the snow from the boughs, since the naked foliage will shift much better for itself than where the snow is partly melted and frozen again." Should any of your readers be able to give a different version of the case, so as to clear up the difficulty, it will be a great boon to landscape gardening. *W. Thorold, Thorpe Bower, near Norwich, July* 20.

House for Succulents.—I have in course of erection a small greenhouse, 12 feet long by about 8 feet wide, intended for the growing of Cacti generally, and also other succulents. Now it has occurred to me that, if all the plants were to be planted out into an ornamental kind of rockwork, it would look much more pleasing, as well as perhaps be better for the plants; but against this there appears to be two objections,—1st, would there not be a greater quantity of insects collected together? and if so, would they not be more difficult to exterminate? and 2d, as to heating. For more reasons than one I could only have it heated with a brick stove placed inside (door to furnace also inside), and a flue from the fire-place along the back of the house. I thought of having over the flue a wood or slate or tile covering, 6 inches or more from the flue each way, and from this three openings into the house hid in the rockwork to convey the heated air into the house from the aperture around the flue; the question then comes whether the earth would not have too great a bottom-heat, and the air of the house too low a temperature (of course the air-drains and flue would be hid altogether by the earth and rockwork). The idea first suggested itself to me from observing a few of the Cacti planted out into a sort of pit in the Cactus house at Kew in a kind of semi natural state, which I think can or might be greatly improved on in private establishments where the responsibility attendant upon failure could only rest with the possessor. *A Subscriber, July* 23. [We should plant the Cacti out in the manner you propose, with no fear of the result, unless from the want of sufficient heat in winter in the front of the house. Insects may be troublesome ; but if the plants are clean when planted out, there is no reason why they should become foul afterwards.]

The Effect of the Steam-kiln on the larvæ of the Limexylon navale in the Italian Oak timber, has been very satisfactory—they are all destroyed, even in the centre of the wood, and have the appearance of short pieces of catgut. The thickness of the wood was 10 inches. *T. S. P., Pembroke Dockyard.*

Purification of Water.—Will "A Friend to Pure Water" add to his kindness, by informing me whether he has ever seen his plan tried? For I could get subscriptions far more readily, if I could assert, from experience, that the plan would succeed. I at first thought of a tank under the pond, as now proposed, but gave it up, for fear of causing the pond to leak ; in this district there is an universal belief that it is most dangerous to meddle with the bottom of ponds over the chalk. Has the writer ever known any instance of a filter permanently under water acting efficiently? Several considerations make me believe that, as far as organic matter is concerned, the aeration of the filtering materials is an important element in their purifying action. There are three other points on which I am anxious for information : is not some contrivance necessary for the escape of the air when the tank is first filled? Why would not a tank holding only 500 or 600 gallons do as well as one holding the proposed 3000 gallons? Do I understand rightly that it is proposed that one filtering stone should be placed directly over another, both being let into the dome of the tank; and, if so, what interspace should there be between the two stones? I trust that "A Friend to Pure Water," or any one else who has experience in this matter, will not think the number of my questions unreasonable, in consideration of the public benefit it would be to the numerous villages situated like ours, and the probability that subscriptions might be procured elsewhere to erect such a filter, if success were certain. *C. D.*

Answers to the Puzzle.—The Yew tree—U. *J. C. L.* ——Ivy. *G. T.*

Water Melons.—The Water-melon might be successfully cultivated in this country ; it is so at St. Petersburgh, where the summer is shorter and colder than in England. The Water-melon is a very handsome fruit, may be eaten in considerable quantity without danger, and is particularly agreeable in sultry weather. Indeed, many years ago it was brought to perfection in an English garden, though much less care had been bestowed upon it than is usually taken for the Melon. There are two distinct varieties of the Water-melon ; the one of these, having white or mottled seeds, is quite insipid, juiceless, and fit only for mixing with other fruits in the composition of *cotignac*, the use made of it in the south of France. The seeds of the other variety are uniformly black, and this it is which is cultivated for the table ; is juicy, of pleasant flavour, and particularly grateful in hot weather. Cotignac, strictly speaking, is the Quince preserved in the inspissated juice of the Grape ; but the Quince being a high-priced fruit, its place is often in great part supplied by Apples, Water-melons, or any other fruit that happens to abound in the Grape season. It seems probable that some such composition as Cotignac was the preserve allowed by the Romans to their agricultural slaves in addition to bread for their winter fare. The Water-melon requires great depth of soil ; 2 feet of good rich garden mould was the usual depth of beds for it at St. Petersburgh. *B.*

Exhibition of 1851 : *Garden Pots.*—A hint for the improvement of garden pots may be taken from some that are manufactured in the neighbourhood of Montpellier. Those of small sizes in ordinary use there nowise differ from the common garden pots of this country, but large ones for Orange trees are always glazed ; so, likewise, are small ones, where extraordinary neatness and cleanliness are desired. Sometimes the glaze is of various colours, or in imitation of marbles, but usually of a bright but rather dark grass green ; this colour seemed to harmonise better than any other with the generality of plants, whether in flower or in leaf only. The price of good unglazed garden pots being about the same at Montpellier as near London, green glazed ones were furnished at about the double of that price. Orange trees : these are usually planted, not in tubs, but in pots, some of which are made up to as much as 2 feet diameter, and when of great size are charged 6*s.*, 8*s.*, or 10*s.* a pot, or even more ; they wear well, not being liable to crack, or for the glaze to scale off. The shape of large pots is always that of some antique vase, and of more or less graceful form according to the taste of the potter ; 8, 10, and 12-inch pots are frequently vase-shaped, so also are some few of small size, for such plants as the Chinese Primrose, and these are very ornamental. One nurseryman at Montpellier had some garden pots made without any bottom, but strengthened by an external bottom rim, the same as at top. He employed them for rearing till in flower Anemones, Ranunculus, and annuals, to be afterwards transferred to China vases for the decoration of drawing-rooms. In the nursery a flat tile supplied the place of a bottom to the pot. Similar bottomless pots were also useful as protection to plants when first bedded out in spring, as also for shading annuals sown in the open ground. The same nurseryman had a useful tool for taking up plants for transplantation ; it was a kind of trowel, but forming a complete cylinder. This tool he pressed perpendicularly into the ground surrounding the plant to be removed, gave the cylinder more or less of a quick turn, and brought up the plant without derangement of the mould surrounding its roots. *B.*

Quantity of Rain Measured in Pembroke Dockyard from January to June inclusive.—

1850.	Gauge 42 ft. 6 in. above the ground.	Gauge 5 feet from the ground.	Thermometer. Max.	Min.
January	2.083	1.964	51 —	21
February	2.146	1.414	53 —	33
March	.667	.813	58 —	22

Cape Amaryllids.—In the *Chronicle* of July 28, 1849, I observed a communication from Mr. Beaton on the crossing of certain kinds of these plants. I formerly had a great fancy for Amaryllids, but I have lost the greater part of my interest in them since the death of Dean Herbert, as I now know no person having a like interest to whom I can communicate my results. I have tried several of the experiments which your correspondent wishes to try, and perhaps he may like to know the success I met with. I do not think the fleshy-seeded Amaryllidaceæ are generally good subjects for the labours of the hybridist, because he must stop (in general) with the first cross, the mules being almost always barren. I also believe that certain Crinums are capable of bearing seed without true impregnation, and few things are more disgusting than to wait seven or eight years, and then to find out that you have only raised a pure plant. I am quite convinced that in many instances when I applied the pollen of Hæmanthus, Amaryllis, Nerine, Ammorchari, and Brunsvigia to the stigmas of a certain plant of Crinum pedunculatum that there was no other plant of Crinum in flower for several miles, and that I extracted all the anthers for several days before the expansion of the flower, yet of the hundreds of seeds I obtained, none produced anything but pure C. pedunculatum. I obtained abundance of seed from Cyrtanthus obliquus by Vallota purpurea, but could never make it vegetate. I could never obtain seed in the reverse manner. I imagine that the raising, in England, of crosses between the Amaryllises is about as unpromising a task as any experimentalist could undertake. In Herbert's "Amaryllidaceæ," p. 278, mention is made of some seedlings raised from Amaryllis blanda by A. Josephiniana. In 1843 Mr. Herbert had the kindness to give me one of these bulbs, which was then, he told me, 20 years old, and was not so big as a goose's egg. It would not, in all probability, have flowered in England in 20 years more ; in a more suitable climate, such as that of my present residence, it would probably have flowered in four years, but it was destroyed by accident. I never saw A. blanda in flower, and now only possess two seedling bulbs, given to me by Mr. Herbert, which are expected to flower this season. (If I get any pollen I will send some to Mr. Beaton to impregnate Belladonna with.) If it should flower, I will repeat Mr. Herbert's experiment, and also raise crosses between it and Belladonna. I raised, in Feb. 1841, a vast number of seedlings from Belladonna, by Josephinæ, and by Brunsvigia multiflora. Belladonna bears many more seeds when impregnated by either of these plants than when naturally impregnated, but the seeds are much smaller. These seedlings flowered for the first time in March 1847, and are extremely beautiful. Their colour is generally like that of Passiflora Kermesina, but it varies in different specimens, and many are blotched with white—from 20 to 40 on a scape. The shape varies greatly, the crosses by B. multiflora being generally wider in the segments than the others, and of a better figure, shorter and more ringent. The germen does not seem to contain any ovules, and the anthers are without pollen. Leaves varying in width from 1 to 4 inches, but always glaucous. I could never keep the seedlings alive which I raised from Josephinæ, by Belladonna, and the one is produced very sparingly. In 1847 I saw a pot containing about 300 seeds of B. multiflora, by Belladonna, but not more than 20 of them germinated, the germen being in the others entirely deficient ; the after history of these is lost to me, but I believe that the bulbs are still living. I also raised (as I thought) in 1841, some seedlings from Belladonna, by Hæmanthus coccineus, and at the present moment I have one anomalous looking plant, expected to flower this season, which may be one of these. I believe that crosses may be easily obtained, in the proper climates, between any of the plants of the genus Amaryllis, and the false (as I consider them), genera Brunsvigia, Buphane, and Ammocharis. I believe that I have raised crosses on Belladonna by all of them. I am more doubtful about Nerine, although I do not see any positive characters distinguishing it from Brunsvigia. What has most surprised me in trying to cross these plants, is that I could never get a cross between Lycoris and Nerine, although they are so very much alike in almost everything except the stigma. *J. C. B., New South Wales.*

Crops in the North of Scotland.—Potatoes are quite free from disease in this locality. All crops are of average quality ; but Grass is sadly burned up. Peruvian Barley is almost fit to cut. *J. Mackenzie, M.D., Inverness.*

Vitality of Pollen.—I think Mr. Beaton is rather too sanguine about the possibility of preserving pollen for any great length of time. I have tried great numbers of experiments on the subject, and the result I have obtained is that hardly any pollen of Exogens retains its vitality after having become thoroughly dry. The pollen of Endogens appears to retain its powers of fertilisation for a considerable time, yet I have never succeeded in preserving the pollen of Amaryllis or Crinum from one season to another, even when kept so perfectly dry as not to have been in the least mouldy ; I have found these two genera to retain their vitality for more than three months. I have never found dry pollen of Iridaceæ efficacious, with the single exception of Gladiolus roseus, by pollen of which, two months old, I have procured one on G. blandus. The pollen of Lilies cannot be kept at all, it *will* mould. It would take up too much of your space to name all the genera of Exogens on which I have experimented, but the only case in which I met with doubtful success (the plants died) was in the genus Melianthus. I never had an opportunity of trying any experiments with Rhododendron, and it is very possible that the peculiar condition of its pollen may render it an exception to the general rule. The best method I have found of preserving pollen is to place the anthers in paper, and the papers in a little tin box, with a closely fitting lid, along with a piece of flannel which should be thoroughly dried before the fire every time the box is opened. *J. C. B.*

Societies.

CALEDONIAN HORTICULTURAL, *July* 6.—At this, the extra summer competition, the following prizes were awarded. Fuchsias (dark and light) : 1st, Mr. Walker, gr. to J. Mood, Esq., for Dr. Jephson and Lord Sandon ; 2d, Mr. Gordon, gr. to Captain Williams, for Scarletina reflexa and Elizabeth. Orchids : 1st, Mr. Thomson, gr. to Dr. Neill, for Cyrtochilum maculatum and Aerides crispum. Pelargoniums : 1st, Mr. Cameron, gr. to S. Hay, Esq., for Forget-me-Not, King of Saxony, Negress, Sir Walter Scott, Centurion, and Nestor. Fancies : ditto, Queen Victoria, Maid of Anjou, and

Mazeppa Superb. Scarlets: ditto, Tom Thumb and Queen Victoria. Dwarf Lobelias: 1st, Mr. Pender, gr. to D. Anderson, Esq., for L. Erinus compacta and alba. Pinks: 1st, Mr. Henderson, gr. to C. K. Sivewright, Esq., for Harriet, Goliah, Whipper-in, Twyford Rival, Morning Star, Lady Mildmay, Lord John Russell, Diana, Jenny Lind, Laura, Robison, and Double X.; 2d, Mr. White, gr. to J. Russell, Esq., for Lady Teazle, Queen Victoria, Oxoniensis, Lord Brougham, Whipper-in, Prince Albert, Pilot, Criterion, Laura, Henry Steers, Mary Ann, and Alfred Morrison. Highest flavoured Strawberry, of recent introduction: 1st, Mr. Lauder, for Malcolm's Aberdeenshire. Cherries: 1st, Mr. King, for Mayduke; 2d, Mr. Thomson, gr. to Captain Falconer, for the same variety. Messrs. J. Dickson and Sons' prize for Moss, Provins, French, Perpetual, China, and Bourbon Roses, was awarded to Mr. Sleigh, gr. to the Lord Advocate, for *Moss*, Common, Louise Collet, Princess Royal, and Laneii; *Provins*, Duchess of Kent, Devigne, La Sylphide, and Common; *French*, Grandissima, Belle Rosine, Surpassetout, and Julie d'Etanges; *Perpetual*, Comte de Montalivet, Duchess of Sutherland, Géant de Batailles, and Comtesse Duchatel; *Hybrid China*, Victor Hugo, Chênedollé, Henri Barbet, and General Jacqueminot; *Bourbons*, Jaune Abricote, Madame Rousseil, Dupetit Thouars, and Bougere. Messrs. Dicksons and Co. exhibited a collection of Exotic plants, including many of the newest and finest Pelargoniums, with Chœnostoma polyanthum, &c.; also boxes of Pelargonium blooms, Pansies, Pinks, and Roses. Messrs. Dickson and Sons likewise sent a collection of Greenhouse Plants, with Gloxinia carminata splendens, and 80 varieties of cut Roses. Messrs. P. Lawson and Son showed Roses, and a collection of plants, including well flowered Balsams. There was also a display of Roses from Mr. Handasyde, and a stand of Pansies, in which were blooms of his seedling variety, Duke of Perth. Mr. Kelly sent Verbenas, Fuchsias, and Petunias; and Mr. Stark, Cantua bicolor, in flower, and other greenhouse plants, Alpines, &c. From Messrs. Downie and Laird came Dielytra spectabilis, Fuchsia Sir John Falstaff, Phloxes and Pinks; and from Mr. Methven, fancy and other Pelargoniums, Adamia versicolor, with blooms of Roses; from Messrs. Ballantyne and Son, Roses with Pansies and Sweet Williams; from Mr. Mackintosh, Roses; and from Mr. Spary, blooms of his new double Pansy. Dr. Neill sent specimens of Onciuium pulvinatum, Francoa ramosa, and Alpines, including a double flowered variety of Sagina procumbens, the smallest double flowered plant known. Professor Dunbar produced Heaths; I. Anderson, Esq., Pentstemon heterophyllum; S. Hay, Esq., Pelargoniums, and Kalosanthes coccinea; Miss Hope, a double flowered Pelargonium; J. Edmond, Esq., Seedling Pinks, and berries of a new and large fruited variety of Red Currant; Mr. W. Cuthbertson, Roses; Mr. W. Ferguson, Roses and Ranunculuses; Mr. Reid, Ranunculuses; — Roughead, Esq., cut flowers; Mr. Aitken, Antirrhinums; J. Mood, Esq, Fuchsias; Mr. W. M'Auslane, Roses, Antirrhinums, and Stocks; Mr. Nicoll, Pelargoniums, Roses, and Ranunculuses; Mr. Forrester, Antirrhinums; Mr. Todd, Scotch Roses; and W. Pattison, Esq., Pansies and Calceolarias. Among plants from the Society's Garden was a Veronica salicifolia, 3 feet in height, 8 feet 9 inches in circumference, and bearing 520 spikes of flowers.

Botanical of London, *July* 5.—J. H. Wilson, Esq., in the chair. J. P. Norman, Esq., and T. Dutton, Esq., were elected members. Mr. Maw exhibited specimens of Lilium pyrenaicum, discovered by him between South Molton and Mollond, Devonshire, in June last. Dr. Hassall read a paper, "On the Colouration of the Water of the Serpentine." In this communication it was shown that the periodical and vivid green colouration of the water of the Serpentine is due to the presence of a minute plant belonging to the tribe of Algæ, of which the writer gave a detailed and critical description, and which he named Corriophytum Thompsoni. The development of this plant takes place early in the spring, out of sight, and at the bottom of the water, and it is only on the approach of the warm weather of summer that it diffuses itself through the water, deeply colouring it, and that part of it rises to the surface, forming a scum or pellicle of a bright æruginous or coppery green colour. The whole of the water of the Serpentine is not usually coloured at one time, but different portions of it at different times, according to the strength and direction of the wind, which drives the plant before it. At one time it is found collected at the Hyde-park extremity; at another it is present in the Kensington division, sometimes on the north and at others on the south shore; the remaining parts of the Serpentine being entirely free from the plant. This variable distribution which, unexplained, would be apt to occasion surprise, accounts for the fact that the observer may sometimes visit the Serpentine and not see a trace of the plant in question, and hence he might be led to form an erroneous conclusion as to the condition of the water. Considered in a sanitary point of view, Dr. Hassall is of opinion that the plant when actually introduced into the system, as when swallowed in bathing, would not be productive of effects injurious to health, but regards it as a test of impurity, and as an evidence of the very bad condition in which the water of the Serpentine now undoubtedly is. Dr. Hassall concluded the communication by observing that the colouration of large pieces of water by means of Confervæ is by no means unfrequent, and cited, as a remarkable instance of it, the Red Sea, which owes its name and colour to the presence of a minute plant diffused through the water, of a blood-red colour.

Royal South London Floricultural, *July* 23.—This Society held its fourth exhibition for the season in the Surrey Zoological Gardens, on Tuesday last. The afternoon was unfavourable, and there was but a thin attendance. The Show itself was a good one. Stove and Greenhouse Plants were plentifully contributed by Messrs. Cole, Frazer, Bruce, Pamplin, Stanly, and Young. Cape Heaths by Messrs. Rollisson, Fairbairn, Frazer, Cole, Bruce and Dennett. Fuchsias by Messrs. Shuckford, Harding, Frazer, and others. Cut Roses by Messrs. Paul and Francis; and there was some good fruit. Carnations and Picotees were good, and shown in great numbers. The competition in some of the classes was spirited, requiring very close scrutiny on the part of the judges to distinguish the winning stands. The following is a list of the awards. Picotees, Amateurs, 12 blooms: 1st, M. May, Esq., for Cleopatra (May), Ophelia (May), Isabella (Wildman), Prince Albert (Marris), Ernestine (Turner), Prince of Wales (Marris), Juliet (May), Portia (May), Viola (May), King James (Headley), Mrs. Barnard (Barnard), Bianca (May); 2d, C. Lockner, Esq., for Goliah, Lady H. Moore, Mrs. Trahar, Gem, Hon. E. Annesley, Queen Victoria, Mrs. Barnard, Isabella, Juliet, Venus, Amy, and Formosa; 3d, Mr. Reeves, for Fanny, Augusta, Queen Victoria, Mrs. Bevan, Princess Royal, Enchantress, Lord Douro, Isabella, Regina (Cox), Cornelius, Mrs. Barnard, and President; 4th, J. Edwards, Esq., for Lord Hardinge, Mrs. Bevan, Prince Albert, Princess Royal, Lady Alice Peel, Miss Edwards, Duke of Newcastle, Mrs. Barnard, King James, Regina, Enchantress, and Venus; 5th, Mr. Ellis, for Princess Augusta of Cambridge, Princess Royal, Privateer, Gem, Duchess of Cambridge, Regina, Beauty (Burroughes), Jenny Lind, Juliet, Delicata, King James, and President. Nurserymen: 1st, Mr. C. Turner, for Prince of Wales (Marris), Prince Albert (Marris), Gem (Youell), Lorina (Burroughes), Cleopatra (May), Goliah, Mrs. Barnard (Barnard), Princess Royal (Willmer), Venus (Headley), Queen Victoria (Green), Juliet (May), and Mary (Dodwell); 2d, Mr. Norman, for Mrs. Norman, James II., Mrs. B. Norman, Lord Nelson, Delicata, Duke of Newcastle, Mrs. Barnard, Venus, Lady Dacre, Prince of Wales, King of Purples, and Gem; 3d, Mr. Ward, for Mrs. Bevan, Princess Royal, Prince Albert, Duchess of Bedford, L'Elegante, Juliet, Gem, Lorina, Mrs. Barnard, Venus, Regina, and Delicata; 4th, Mr. Bragg, for Gem, Sebastian, Lady Dacre, Prince of Wales, Hon. E. Annesley, Smilax, Queen Victoria (Green), Lady Alice Peel, Mrs. Barnard, Juliet, Enchantress, and Venus; 5th, Mr. Keynes, and an extra prize was awarded to Mr. Willmer. Carnations, Amateurs, 12 blooms: 1st, Mr. Reeves, for Princess Royal, Rainbow, Brutus, Prince Albert, Grenadier, Flora's Garland, Defiance (Sharp), Paul Pry, Wm. Cobbett, Mary Ann, Georgiana, and Conquering Hero; 2d, M. May, Esq., for Bardolph (May), Coriolanus (May), Antonio (May), Somerset May), Duncan (May), Lorenzo (May), Beauty of Woodhouse (Mansley), Falconbridge (May), Queen Victoria (Simpson), Romeo (May), Bolingbroke (May), and Justice Shallow (May); 3d, Mr. Edwards, for Prince Albert (Hale), Hotspur, Rainbow, Lady of the Lake, Solander, Harriet, Sarah Payne, Beauty of Woodhouse, Lydia, True Briton, Flora's Garland, and Admiral Curzon; 4th, Mr. Ellis, for Ariel, William the Fourth, Flora's Garland, Chance, Georgiana, Squire Meynell, Prince Albert, Hero of Middlesex, Lord Pollington, Beauty of Brighouse, Lady Gardner, and Harriet; 5th, Mr. Newhall, for Prince Albert, Flora's Garland, Lord Byron, Georgiana, Dido, Beauty of Woodhouse, Pauline, Lovely Ann, Princess, Regular, and Beauty of Brighouse. Nurserymen: 1st, Mr. C. Turner, for Admiral Curzon (Easom), Flora's Garland (Brooks), Princess Royal (Puxley), Brutus (Colcutt), Antonio (May), Duncan (May), Bardolph (May), Justice Shallow (May), Beauty of Woodhouse (Mansley), Perfection (Puxley), Ariel (May), and Queen (Puxley). An equal 1st prize was awarded to Mr. Ward, for Princess Royal, Prince Albert, Lord Rancliffe, Flora's Garland, Georgiana, Lady Gardner, Squire Meynell, Vivid, Admiral Curzon, Sir Harry Smith, Squire Trow and Queen of Roses; 2d, Mr. Norman, for Dido, Rainbow, Queen Victoria, True Briton, Queen, Duke of Sutherland, Squire Meynell, Flora's Garland, Vivid, Count Pauline, Admiral Curzon, and Harriet; 3d, Mr. Bragg, for Brutus, Lady of the Lake, Duke of York, Prince Arthur, Flora's Garland, Lord Rancliffe, Beauty of Woodhouse, Ariel, Mrs. Barnard, Splendid, Count Pauline, and Sarah Payne; 4th, Mr. Keynes; 5th, Mr. Willmer. Class showing Specimen Blooms: 20 prizes out of the 22 offered were awarded to Mr. Turner, of Slough; Mr. Ward and Mr. Norman having each one. We shall content ourselves with naming the successful flowers. Some of the blooms in this class were very fine specimens, particularly May's Justice Shallow, in Carnations, a scarlet flake of the finest quality, having petals of great substance, very smooth on the edges, and full size. Carnations.—Scarlet Bizarre: 1st Puxley's Howard; 2d, Puxley's Emperor. Crimson Bizarre: 1st, Lord Milton. Pink Bizarre: 1st, Henry Kirke White; 2d, Twyford Perfection. Purple Flake: 1st, Puxley's Perfection. Scarlet Flake: 1st, May's Justice Shallow; 2d, May's Seedling. Rose Flake: 1st, Flora's Garland; 2d, May's Romeo. Picotees.—Heavy Rose: 1st, Headley's Venus; 2d, Marris's Victoria Regina. Light Rose: 1st, Mrs. Barnard; 2d, Marris's Countess Howe. Heavy Purple: 1st, Dodwell's Mary; 2d, May's Viola. Light Purple: 1st, Lorina; 2d, Prince Albert (Marris). Heavy Red: 1st, Mrs. Norman (Norman); 2d, Marris's Prince of Wales. Seedlings.—Mr. Norman received a Certificate for Mrs. Norman, heavy red Picotee; the edging in which is broad and laid on very solid and firmly, white good, petal of fine substance and shape; not only the best of its class, but one of the best Picotees in cultivation. A Certificate was awarded to Mr. Bragg's Duke of Wellington, scarlet bizarre, but for what reason we could not discover, for there are at least a score far superior flowers in this class already. A Certificate was also awarded to his Princess Alice, a small neat yellow Picotee.

Reviews.

The Botanical Text-book. By Asa Gray, M.D. 8vo. New York, Putnam. Pp. 520, with many hundred woodcuts. This work having reached its fourth edition must be considered a fair exposition of the views entertained in the United States respecting the science of which it treats. It differs in little from similar works published in Europe, and will be found useful to students on either side the Atlantic. It more especially merits praise on this account that it eschews hard words and pedantic terms, but is clothed in a dress as much English as such books are likely to be or very well can be. Criticism of such works is not called for in this place; or we should have offered some objections to the author's views on certain debateable points, especially as regards the speculation bearing the absurd name of *dédoublement* or unlining, on which we shall now only observe that we think Dr. Asa Gray does not show his usually sound judgment, especially when he accepts as facts some sufficiently apocryphal assertions.

Miscellaneous.

Destruction of Wasps.—The annual sport among the youths of Traquair came to a close on Saturday, the 1st of June. They have bagged less game, and also less money, than usual this year. Let us take a retrospective view of the havoc that has been made among wasps for the last seven years, which will show how anxious the Earl of Traquair is to get rid of this destructive pest in his neighbourhood:—In 1844 there were destroyed 244 dozen; in 1845, 1573 dozen, weight 4 lbs. 9½ oz.; in 1846, not a wasp to be found; in 1847, 4 dozen only, weight 4 oz.; in 1848, there were destroyed 1273½ dozen, weight 4 lbs. 7 oz.; in 1849, 865½ dozen, weight 2 lbs. 8 oz.; in 1850, 528½ dozen, weight 1 lb. 11½ oz. Total, 4459½ doz., weight 13 lbs. 8 oz. during the last seven years, or rather five years, as in 1846-47, only four dozens were taken; these dozens will make the number of wasps to be 53,514—a good round number certainly in a circuit of three miles. Now, if all, or even one-half, of the proprietors in the country would use the same means to exterminate these insects, a wasp would soon be as rare a sight as a red deer on the hills around us.—*Edinburgh Evening Courant.*

Preservation of Green Kidney Beans.—The following is the process employed by M. Gehen de Montigny, for the preservation of green Kidney Beans. In fine weather gather the pods, before the seeds are too visible, take the threads off, plunge the pods in boiling water, and take them out again immediately; let them cool, put them in a tub in layers 5 inches deep, alternating with Vine leaves, which must begin and end the series; on the top of the last layer of Vine-leaves put a stone, heavy enough to keep the whole well pressed. Then pour in some salt water until the top is covered; replace the water as it evaporates. The Beans can thus be preserved quite fresh. *Flore des Serres.*

On the Use of Coffee in Arabia and Abyssinia. By M. A. d'Abbadie.—Great nutritive qualities have been attributed to coffee by M. de Gasparin, in his memoir, on the mode of living pursued by Belgian miners; and he quotes, in support of his opinion, the experience of the French soldiers in Algiers, and of the Arab nations. Without pretending to dispute the accuracy of M. de Gasparin's conclusions, I may be allowed to state that the experience of the Arab tribes is not entirely in his favour. It is well known that the Wahabis, who dissent from Islamism, scrupulously abstain from coffee; and although I have lived with many of this sect, I never found that they were less temperate or less capable of fatigue than their coffee-drinking countrymen. If a proof more convincing than the above is sought, it will be found in Abyssinia, where the Mussulmans, who drink coffee several times a day, support a fast with less ease than the Christians. This has been many times observed by my brother, M. Arnauld d'Abbadie, who commanded soldiers of both religions in the wars of Gojjam. In the disastrous retreats across desert countries, the Mussulmans always suffered more than the Christians. The latter, who think it a crime to drink coffee, will follow the army on foot, heavily laden, for three successive days without any other refreshment than a little earth soaked in cold water. These same soldiers will fight during Lent without other nourishment than a quarter of a pound of unsifted flour, which is often baked in ashes, and without leaven. This flour is less nutritious than that of Wheat, and the single meal is often at sunset, after a fatiguing day's march, and a 24 hours' fast. The Abyssinians are both less strong and less temperate than the Gallas. The latter, the whole object of whose existence seems to be continual warfare, often pass several days in succession in the deserts which separate them from their enemies. The Gallas then fast for an incredible length of time, which the traveller Bruce explains by their use of coffee boiled with its shell in butter, and seasoned with salt. It is true that the Gallas do use this substance, which will keep a long time, and which I have often tasted with pleasure, but they do not look upon it as an aliment. Before undertaking their military expeditions, they lay in an extra stock of strength by a very substantial and varied repast, taken in absolute rest, in huts at a distance from their women. They then start with a few Chick-peas, which they eat raw, and which they soon finish, fast if necessary for several days together, and afterwards fight with such vigour that their enemies never mention it without some expression of astonishment. It is well known that in Abyssinia, raw meat, whether fat or lean, does not possess the nutritive qualities which have been ascribed to it by M. Magendie in European meat. Whilst staying with the army of Agame, I heard the soldiers, who daily killed some hundreds of oxen, complain that they were losing their strength from exclusively eating raw meat. One of my porters gave up his situation and refused the extra pay which I offered him, because he said that he was losing his strength from the want of bread and the constant eating of raw flesh. This fact is admitted as true by all Abyssinians, notwithstanding their great liking for uncooked meat. An Abyssinian epicure would despise a meal which did not, partly at least, consist of a good raw lump of cow's flesh, still warm with animal heat and seasoned with pepper. On the other hand, my brother is satisfied, both by observation and by experiment, that, in the same countries, meat dried in the sun restores one's strength much better than raw meat, though not so well as corn. *Comptes Rendus.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Pelargoniums which have done blooming should be cut down, and the old plants set in an open place till

they have begun to break, when they should be shaken out and repotted in smaller sized pots. Cuttings should be taken of the best varieties, as they will strike now, in the open ground, with greater freedom than they will at any time during the year, if coddled up by bottom heat and so forth; besides which, the plants they produce are healthier, more robust, and form handsome specimens in a shorter space of time. Proceed by loosening the soil of a south border, and by mixing a little sand with it if required; after which insert the cuttings 3 inches apart, fastening them well with the thumb and fore finger. If very dry weather occur, it will be necessary to water them occasionally; but, if possible, defer this till their bases are cicatrised over. As soon as they have made a few fresh leaves, they can be taken up, potted into 3 and 4-inch pots, and placed for a few days in a close frame; after which they may be gradually exposed to the sun and air. The watering of Chrysanthemums which are being prepared for early winter flowering should be carefully attended to, or they will lose their lower leaves, by which the appearance of the plant will be spoiled, and the production of useless suckers encouraged. Old plants which were planted out for the purpose of layering, should now have the points of the shoots pegged down; after this preliminary operation, the points will re-erect themselves, and in a week's time they may be layered in small pots, plunged immediately under the bent portion of the shoot. Attend to the repotting of the established plants, as often as they require it Nothing is so bad as to allow the roots to become cramped in the pots.

FORCING DEPARTMENT.

VINERIES.—Early Vines which have completed their growth, ripened their leaves, and are showing an evident desire to go to rest, should have as much air as possible, lest the summer heat should induce them to start again into growth. The side, front, and back upright ventilator should always remain open; and when a sufficient amount of ventilation is not attainable by these means, the lower ends of the sashes should be propped up, so as to ensure a free circulation of air through the house. In very wet weather also this plan is preferable to that of sliding down the top sashes, as it is not less essential to keep the soil dry than it is to keep the atmosphere cool, during the season of rest. To this end the outside border should from this time be covered with a tarpauling or some other contrivance during rainy weather. PEACH-HOUSES, APRICOTS, and CHERRIES.—Let no exertion be spared that will contribute to keep the foliage healthy and clean as long as possible, by maintaining a cool moist atmosphere. Take care that the soil of the borders inside the house does not get too dry, or this will cause the plants to shed their leaves prematurely; and, on the other hand, do not allow it to get too wet, or the half-ripened buds will burst. Where the fruit is not yet gathered, a somewhat drier atmosphere should be preserved on its account. FIGS.—Where these are now ripening, the house must be kept somewhat drier, but at the same time the state of the soil must be carefully watched, lest it gets too dry and cause the swelling fruit to drop off. Beware of red spider, which is particularly apt to establish itself at such a crisis, when the swelling fruits are making large demands upon the energies of the plants, and are thereby checking in some measure their vigorous growth. This is an evil which must be carefully guarded against.

FLOWER GARDEN AND SHRUBBERIES.

At this season there is always an abundance of work requiring immediate attention, which can only be done by concentrating all available force upon it, and proceeding with it in a progressive manner; taking care, by vigilant superintendence, that each portion is finished before another is commenced. Numberless plants are demanding additional staking and tying, to preserve them from breaking down. Many beds and patches of early flowering annuals are now past their prime, and should be removed, filling their places with the gayest things that can be selected from the reserve garden. These matters should not be neglected even for a day, as a garden should at all times, if possible, present a scene of progressive beauty; to which end every effort should be made to conceal or alter anything which would give it a declining or fading appearance. Advantage should be taken of favourable weather to do many jobs in the reserve garden, such as thinning and transplanting young annuals, biennials, and perennials, and various shrubs which stand too close in their seedling beds. The propagation of half-hardy plants for next season should be commenced as soon as that of the hardier species mentioned in former weeks' Calendars is completed. The propagation of many plants, of which a great quantity is required, is sometimes rendered difficult by their tendency to produce nothing but flowering shoots; by closely cutting in a few of the plants, this difficulty will be obviated, as they will thereby be induced to throw out strong young shoots, which strike with the greatest facility. This hint applies to Lobelias, Petunias, Delphinium grandiflorum, and many other plants of a similar character. While the shoots of these are preparing, operations may at once commence with scarlet Pelargoniums, which should he propagated early, to allow them time to become established and hardened before winter. They are easily propagated in any situation from a slight bottom heat to the front of a south wall. The latter method is of course the best at this season, as they never fail to strike, and there is no trouble with them until ready for potting. About London, some thousands of Geranium cuttings are struck in the open ground without protection.

State of the Weather near London, for the week ending July 25, 1850, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 1st Aug., 1846—therm. 92 deg.; and the lowest on the 29th, 1828 and 1845; 1st Aug., 1842; and 3d, 1848—therm. 43 deg.

Notices to Correspondents.

ANTS: *Sub.* See p. 293 of the current year's volume.‡

BOOKS: *H W.* We could not give advice on the subject. Authors and publishers should judge and act for themselves.—*Erzeroum.* We fear that the Crocuses have all died; the corms were very weak. We will send you a book in which your plants will be noticed when there is anything to say about them. Probably the two best books for you are Bieberstein's "Flora Taurico-caucasica," and Ledebour's "Flora Rossica," or Grisebach's "Flora Rumelica."—*A H.* "Roberts on the Vine," with the exception of putting carrion into borders.‡

CHARLOCK: *β.* The flowers are attacked by white rust (Uredo candida), of which an account has been given by the Rev. Mr. Berkeley, in the "Journal of the Horticultural Society," vol. iii. p. 266. The following cut represents a plant attacked by it.

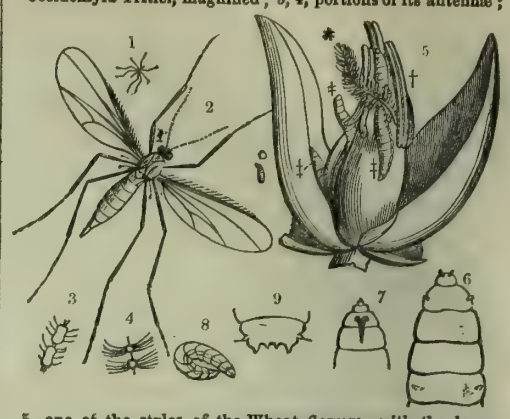
COPING: *A Gardener.* We never recommend tradesmen.‡

CUCUMBERS: *J P.* They are affected by the same mildew which attacks the Vine. Sulphur will kill it if *it is applied the moment the fungus appears.* All depends on that.‡

DEODAR: *F M S.* You are a little too early in your removal of it, but will probably succeed. If it flags, shade it by throwing wet mats over it. Do not water it; but syringe it if necessary. In a fortnight it will be nearly safe, in such weather as this.

FIRS: *C.* Your specimen has all the appearance of having been killed by cold, when very young and tender. Much unsuspected damage was done by the frost on the 3d of May. The brick-ground is probably innocent, unless indeed *very* sulphury coals were used when the leaves were soft. Whether your trees will recover will be apparent in three weeks from this time.

GRAPES: *An old Subscriber.* Mildew is very abundant—rather an awkward fact for the Potato crop. If you use flowers of sulphur early enough and often enough, dusting it upon the patches as soon as they are discoverable, you will stop the egg-mildew of the Vine. If the preventive is neglected the mischief becomes irreparable.— *G T.* Excess of moisture *somewhere* is the cause; it may be in the soil, or the air, or in both. If you have not full circulation of air, that at once explains the mischief. Figs have nothing to do with it.



GREENHOUSES: *W W.* What your house ails is to be drier in winter. It is certain that the spot in Pelargoniums is caused by damp and cold, combined. You must either make your house drier, or else warmer. This will be easier, we imagine, than pulling it down and altering its aspect, which will do no good.

HEATING: *Mrs F.* The woodcut of the cheap heating contrivance, or little portable greenhouse, given at p. 408, was borrowed from our volume for 1841, p. 796, where it is stated to have been tried and to have succeeded. We have had no experience of its working ourselves; but we see no reason why it should not answer under proper management.‡

HERBACEOUS PLANTS: *An old Subscriber.* Plant of Cheadle, Mackie of Norwich, Masters of Canterbury, Backhouse of [illegible], Whitley and Osborn of Fulham.*

HOUSE BUG: *A C* will thank some one to give him a recipe for the removal of the unsightly bunches and harassing itching occasioned by the bite of the common house bug. [We say destroy the bugs.]

INSECTS: *T C.* You will find a description and figure of the orange larva of the Wheat ear, and of its perfect state, in our volume for 1847, p. 604, (figs 1 and 2, the perfect insect, Cecidomyia Tritici, magnified; 3, 4, portions of its antennæ;

5, one of the styles of the Wheat flowers, with the larvæ magnified; 6, 7, 8, 9, details of the larva.) Your Θυσανδερος does not belong to the Thysanoura, but is the larva of a small beetle Megatoma undatum. *W.—H R B.* The maggots are the larvæ of the Wheat midge, mentioned in the preceding reply. *W.—W T.* The small Elephant Hawk moth (Chærocampa Porcellus); the extraneous matter attached to the eye is the pollen masses of an Ophrys. Eggs are not always green, each species has its own colour; the green colour of the eggs sent is owing to the little green larva within, seen through their transparent shells. *W.—J G N.* We are sorry to say that the ears of Wheat from the neighbourhood of Great Yarmouth are seriously injured by the Wheat midge; no remedy for which can now be adopted, but when gathered the use of the midge sieves ought to be more generally adopted. *W.—A W F C.* The caterpillars found on the Poplar are those of the common puss moth Cerura Vinula. *W.—J. D.* The minute insects found in the crevices of the bark of the standard Roses are a minute species of mite, but the young buds were doubtless eaten off by a weevil Otiorhynchus sulcatus, and not by these insects. *W.*

MEALY BUG: *Constant Reader.* If once it obtains a footing, it is difficult to get rid of mealy bug. Kyle's liquid is stated to kill it without injuring the plants.‡

MELONS: *Offa.* It is a dangerous experiment.

MOWING MACHINE: *R G K.* That used at Trentham and at Kew is, we believe, Shanks', and is drawn by a horse.‡

NAMES OF PLANTS: *J R.* It is really a Bougainvillea, and probably spectabilis. —*W D H.* Apparently Maxillaria variabilis.—*Erzeroum.* 369, Coronilla varia; 454, Colutea. You will get a good many answers in the course of the autumn, when we have leisure to examine difficult points.—*Rougham.* Oncidium triquetrum. —*J G.* Scleroderma vulgare.—*L N R.* 1, Phyteuma orbiculare; 2, Asperugo procumbens; 3, Acinos vulgaris; 4, Lamium amplexicaule.—*New Zealand.* If you have that curious Rubus in flower, we would beg of you to send us a better specimen. —*M D.* Celastrus scandens, Berberis aquifolium, Quercus pedunculata, apparently. —*H T.* Ipomœa phœnicea.—*J H N.* Crinum longifolium.—*Oldham.* A little ugly white Fox-glove.—*J P.* 1, Amelanchier Botryapium; 2, Kalosanthes coccinea; 3, Bartonia aurea; 4, Commelina tuberosa; 5, Cacalia coccinea.—*Field Mouse.* 1, Teucrium Scorodonia; 2, Melampyrum pratense.—*Offa.* 1, Siphocampylus bicolor; 2, Nierembergia gracilis; 3, Diplacus puniceus; 4, Campanula garganica. We entreat you to send plants for names in a state fit for examination. You have no idea of the waste of time caused by questions concerning withered fragments scarcely more fit for determination than if they were fossils.

NEW HOLLAND: *H H.* Good European seeds are always prized at Sidney—by good, we mean of a fine quality. They do not care much for rareties. Pack the seeds in loose canvas bags, and hang them from a nail in the cabin. As to what you may purchase at Sydney, we believe that there is little which can *not* be bought. Quality is the point; not sort.

PEAR TREES: *M F.* Probably the first crop was killed by frost, and the tree is attempting to renew the effort at fructifying. Such things are not very rare. If it bears a heavy crop of fruit, the tendency will probably disappear.

PICQUOTAISE: *M P.* The plant brought to France by M. Picquot from North America, and cultivated in the gardens of Versailles and the Horticultural Society of Paris, *as a substitute for the Potato,* has been introduced into this country. It is stated to be more nutritious than the Potato; but is in reality worthless, and as unfit for cultivation as the Apios tuberosa, or Saa-ga-ban itself. It has been grown in the Garden of the Horticultural Society of London.

PRICKLY GERANIUM: *A Florist.* Let it be pot bound, and give it no more water than is necessary to keep it alive.

RAIN-WATER: *Birkhurst.* Large lumps of charcoal thrown into the water-butts (not dust charcoal) will much improve its quality.

RHODANTHE: *L B S.* Your case is incomprehensible. There is nothing wrong in your management, unless you allow the roots to become too dry. Is there no grub at the roots?

ROOT-PRUNING: *J Abell.* Your Pear trees (which are 3 or 4 inches in diameter, a few inches from the ground, and growing luxuriantly) should have a trench opened round them about 4½ feet from the stem, and as deep as the roots go. Cut all very strong roots, which are going down into the subsoil, with a strong chisel; and, in filling in the trench, add some fresh turfy loam. Let the ground round the tree be thoroughly watered a few hours before the trench is opened; this will soften the soil, and very much facilitate the operation.‡

SEEDS: *Constant Reader.* You cannot raise Orchids from seed.

MISC: *Iota.* We do not recollect a white variety of the common Mallow; but we should fully expect such a thing to exist.

SEEDLING FLOWERS.

PELARGONIUMS: *T K.* A pretty light variety, of medium size, with pretty well formed upper petals; but the under ones are too long and pointed.*—*H W B.* Will you kindly send us another bloom? The last was not received in good condition.*

ROSES; *E H.* Very fragrant, but, being bruised to pieces when received, this is all that can be said of it.*

PERUVIAN GUANO.—As Agents of the Peruvian Government for the importation and sale of this valuable MANURE, we think it right, for the protection of consumers and respectable dealers, to apprise them that the adulteration of the article is still extensively practised, and to recommend them to apply either to ourselves, to our agents, Messrs. GIBBS, BRIGHT, and Co., of Liverpool and Bristol, or to dealers of established character, in whose honesty and fair dealing they can place implicit confidence. ANTONY GIBBS and SONS.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

Corn and Grass Manure, per ton	£10	0	0
Clover Manure, do.	11	0	0
Turnip Manure, do.	7	0	0
Superphosphate of Lime	7	0	0
Sulphuric Acid and Coprolites	5	0	0

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 15*s.* per ton; and for 5 tons or more, 9*l.* 10*s.* per ton, in dock. Sulphate of Ammonia, &c.

CORN MANURE FOR WHEAT, BARLEY, OATS, BEANS, &c. &c.

THE LONDON MANURE COMPANY most confidently recommend the above, as tney are daily receiving very satisfactory accounts from parties who used it with great success last season. It will be found fully equal to and much cheaper than Peruvian Guano, and is not so liable to produce so large a growth of straw. Price Seven Guineas per ton, 3 cwt. per acre. They also beg to offer their Concentrated Urate, Superphosphate Lime, Nitrate of Soda, Sulphate and Phosphate of Ammonia, Fishery and other Salt, Gypsum, Sulphuric Acid, and genuine Peruvian Guano. To insure this free from adulteration, all purchasers can receive it direct from the Warehouses of the Importer.

Bridge-street, Blackfriars. EDWARD PURSER, Secretary.
Country Dealers and Agents supplied.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

E. DENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses, when completed charged, from 1*s.* 3*d.* to 1*s.* 6*d.* per superficial foot, according to size and quantity; on one principle the roof is formed without wood or putty, and on another principle with wood rafters, and the glass put in with putty. Patent Sashes, requiring no paint, from 7*d.* to 9*d.* per foot. HEATING BY HOT WATER.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

THE CONICAL BOILERS INVENTED BY JOHN ROGERS, Esq., are supplied and fixed by JOHN SHEWEN, ironmonger, Sevenoaks. Also all kinds of Hot Water Apparatus. For Churches and Public Buildings, Mr. SHEWEN should be consulted, his Warm Air Apparatus being safer, more efficient, and more durable than any other.

SCIENTIFIC ACADEMY AND AGRICULTURAL TRAINING SCHOOL, Kennington, near London, July 20, 1850.

MESSRS. NESBIT take the liberty of directing the attention of Parents to the advantages offered by their Establishment, in the education of youth intended for the Arts, Manufactures, or Agriculture. Though the power, influence, and wealth of England, depend, in a great measure, upon the proper application of scientific knowledge to the working of her minerals and soils; yet, in the education of her youth, Science has hitherto been almost wholly neglected. It is, however, evident that a young man, who, in addition to the common education, possesses a sound knowledge of Analytical Chemistry, Mineralogy, and other kindred subjects, will be the best prepared to engage with success in any technical branch of business for which he may be designed.

In their system of instruction, Messrs. NESBIT give a prominent position to the physical sciences; and experience has proved that instead of retarding the pursuit of the ordinary studies, they materially assist in their acquirement.

The pupils have repeatedly been examined by some of the first Professors in the Metropolis, who have expressed themselves highly gratified with their general knowledge, and with their attainments in physical science.

Terms and other particulars may be known on application.
38, Kennington-lane, London.

MESSRS. NESBIT'S CHEMICAL AND AGRICULTURAL SCHOOL, 38, Kennington-lane, London.—A sound practical knowledge of Analytical and Agricultural Chemistry, Geology, Surveying, Levelling, Railway Engineering, &c., may be obtained in Messrs. NESBIT'S Academy, in addition to a good modern education.

Mr. NESBIT'S works on Arithmetic, Mensuration, Gauging, Land Surveying, English Parsing, &c., are published by LONGMAN and Co., and may be had of all Booksellers.

TO NOBLEMEN and GENTLEMEN who require a plentiful and CONSTANT SUPPLY of PURE WATER to their Country Mansions.

Messrs. EASTON and AMOS beg to offer their improved PATENT HYDRAULIC RAM, which is perfectly self-acting, and without manual labour is capable of lifting water to 30 times the height of the waterfall by which it is worked.

THIS MACHINE CAN BE APPLIED WHEREVER A FALL OF WATER OF A FEW FEET CAN BE OBTAINED; and its cheapness and durability, with the fact that upwards of 500 of them erected in England and other countries by Messrs. EASTON and AMOS have now been at work many years, afford ample proof of its great value and efficiency.

Estimates of the expense of the Machine, Pipes for the conveyance of Water, Tanks, and Reservoirs, may be had on application to Messrs. EASTON and AMOS, CONSULTING ENGINEERS to the ROYAL AGRICULTURAL SOCIETY, at their office in Orange-street, Trafalgar-square, or at the Works in the Grove, Southwark, London.

PURE WATER raised to any height from a small stream, where a fall can be obtained, by FREEMAN ROE and HANSON'S IMPROVED RAM; less waste, by two-thirds, than those ordinarily in use. Portable Steam Engines for Agricultural purposes, Threshing Machines, Deep-well Pumps, Water-wheels, Baths, Hot-water Apparatus, and Fountains. Towns supplied with Gas or Water. Drawings and Estimates made.—FREEMAN ROE and HANSON, Hydraulic and Gas Engineers; Office, 70, Strand, London.

DR. S. NEWINGTON'S HAND-DRILL HOES AND CULTIVATORS, to the frames of which are fitted Coulters for earthing up Potatoes and drawing out furrows for seeds. The chisel-pointed tines have moveable hoeing shares fitted to them, which can be removed when the tines are only required for stirring. These shares, which are made of any required width, hoe from 2 to 4 inches below the surface, according to the soil; on the shares being removed, the tines stir from 5 to 6 inches deep, a lad being enabled to hoe 2 acres of Turnips, &c., daily, cutting off every weed, and setting out the plants, reducing the price of labour from 4*s.* to 8*d.* an acre, or being able to hoe the crop six times, and much more effectually, for the same money now paid for hand-hoeing. Messrs. DUFAUR and Co. will exhibit, at the Royal Agricultural Show at Exeter, the following implements invented by Dr. NEWINGTON: A Drop Drill for horse power; the same for hand power; an implement to supersede broadcasting seed by hand for horse power; the same by hand power; an implement for broadcasting artificial manures or depositing it in rows by horse power; the same by hand power; a horse Dibble; a hand wheel Dibble; a subsoil Plough; a Scarifier or Cultivator; a paring Plough; a single horse Plough; hand drill Hoe and Cultivators, with various other fittings; a strike Plough.—Apply to Messrs. DUFAUR and Co., 21, Red Lion-square, London, who are the sole manufacturers and vendors of Dr. NEWINGTON'S inventions.

REAPING SCYTHES.—A GREAT SAVING in STRAW AND LABOUR is effected by the use of DRUMMONDS' IMPROVED REAPING SCYTHE, in cutting down all sorts of corn crops. The demand for these scythes is yearly increasing, and they continue to give every satisfaction. May be had from the subscribers at 10*s.* 6*d.*, or 9*s.* 6*d.* each, when three or more are taken, and forwarded carriage paid to Liverpool, Hull, Newcastle, and to all the stations along the lines of the Caledonian and North British Railways.

W. DRUMMOND & SONS, Agricultural Museum, Stirling, N.B.

N.B.—Orders from unknown correspondents will not be attended to unless accompanied by a remittance.

The Agricultural Gazette.

SATURDAY, JULY 27, 1850.

MEETING FOR THE FOLLOWING WEEK.
THURSDAY, Aug. 1—Agricultural Imp. Society of Ireland.

"THE PRINCIPLE ADOPTED HERE IS TO MANURE FOR EVERY CROP." (*Times Commissioners on the farm of Mr. Hudson, Castleacre.*) It has long been our opinion that the introduction of artificial manures would ultimately work a complete change in the practice of farming, and when the principles on which they should be prepared become thoroughly understood, and honest manufacturers have been secured, we look forward most confidently to the universal adoption of Mr. HUDSON'S plan of "MANURING FOR EVERY CROP."

The usual system of manuring once in four or five years must evidently be a very wasteful practice, as, long before the last crop of the rotation requires its assistance, much of the soluble and most valuable portion of the manure must be washed out.

Until the discovery of artificial manures, the farmer had, however, no alternative but to follow out the old system, as it is obvious that farm-yard manure cannot be carted on to every crop; besides, the expense and labour involved in moving such large quantities of manure (if it could even be procured) was also an insurmountable barrier to the application of either farm-yard manure or compost to the land at shorter intervals of time than four or five years.

The plan adopted by Mr. HUDSON and many other farmers in Norfolk is to apply the farm-yard manure along with a portion of prepared bones to the Turnip crop—the other crops also, in most cases, receiving a top-dressing; or, when fed off by sheep or cattle, a quantity of Linseed cake is always consumed along with it. Such a style of farming leaves little to be desired, and certainly contrasts most strongly with the system of two white crops and a bare fallow, on which we commented a few weeks ago.

Can it be possible that those landowners, who persist in letting their land from year to year, will still shut their eyes to the contrast afforded by Mr. HUDSON'S farm and their own miserable estates? Mr. HUDSON'S farm is, we see by the report of the *Times* Commissioners, covered over with clay marl once in a lease of 21 years. Here we see a tenant farmer effecting an improvement on another person's property, and for the repayment of his outlay, waiting patiently during the lapse of a 21 years' lease. Does such a thing ever occur on a yearly holding? Suppose Mr. HUDSON'S farm were let from year to year, would his farm then be covered over with clay marl? We think not. Who would then be the sufferer, the owner or the tenant?

We direct particular attention to this marling—its close and inevitable connection with a lease—and also to the necessary consequence, high farming, by the application of manure to every crop. It is because we believe that this high farming cannot exist without a lease, any more than a lease without its invariable concomitant high farming, that we direct attention to their connection in the case of Mr. HUDSON. To those of our readers who are not so fortunately situated, in respect of a lease, our remarks have no application.

For the reasons already named, it is obviously impossible that the principle of applying manure to every crop can be carried out with the ordinary resources of the farm; and for the full development of this system artificial manures are evidently the only available means within our reach.

The result of past experience has been to establish most clearly the value of these manures for the growth of Turnips; but their application to the Cereals (though undoubtedly useful), has not been quite so successful. Whilst many thousands of acres of the former have been grown with artificial manures alone, we dare not depend upon them exclusively for a crop of Wheat or Oats. In the present state of our knowledge, it would be difficult to assign a reason for this result of our own observation and practice on a Wheat soil, and we would be glad to hear from Mr. HUDSON, or any of his neighbours, if they have been more fortunate. We by no means assert that artificial manures are useless to corn crops. Only the complete success which has attended their use in the case of Turnips makes us desire a similar result for the Cereals. Whether this will be brought about by improvements in the mode of preparation, or greater skill in the application of these valuable manures, time alone can decide.

In the meantime, we are glad to be able to report, on the result of a series of experiments, that artificial manures are likely to prove very valuable for the Clover crop. Should our anticipations prove correct in this instance, it will be a great boon on strong soils, where Clover has hitherto been the only or principal green crop.

The substance which, amidst a host of others at present thrust on the farmer's notice, we find most useful to our Clover crops, is bone dissolved in acid. We were hardly prepared to find that Turnips and Clover would both be benefited by the same manure. Attention was first drawn to superphosphate, as a Clover manure, by observing that that crop was always better, where it had been used for Turnips. We observe in one of last week's country reports in the *Mark Lane Express*, a similar result has been noticed. Such, then, is the present amount of our knowledge in the use and application of artificial manures, and we would recommend our readers to try their application next spring on the Clover. It will be long and many a day before Mr. HUDSON'S plan will be universally adopted; but after so much has been done with Turnips, if we can be the means of extending the principle to the Clover crop, a very important step will be gained.

IT is a somewhat singular fact that the farmers, as a body, are almost, if not altogether, apathetic in the cause of ROAD REFORM, if we except a few who are avowedly averse to any alteration of the present system, because they fortunately happen to be situated in the vicinity of a statute-labour road connected with a market-town. In these cases the farmer has the free run of such roads by only paying the statute-labour assessment, which, in Scotland, varies from 3*d.* to 7*d.* per imperial acre, according as the debt and cost of management are small or great. Many farmers—much the larger proportion—on the other hand, are so situated in the midst of a network of turnpike-roads, as to be totally disabled from sending horse or cart to market without being caught in one or other of the meshes at which toll is exigible, while, at the same time, they are compelled to pay for maintaining the statute-labour roads, which they rarely have occasion to use. In the former case the farmer pays only for the roads he requires, while, in the latter, he has to pay both for those he uses and those he does not use. If it be assumed—and this view seems greatly in vogue with those who oppose Mr. PAGAN'S plan of road reform—that those who wear the roads should mend them, how comes it that a farmer, encircled with toll-bars, is assessed also for repairing the statute-labour roads? these roads being maintained by a fund raised, without distinction, by an annual acreage charge on land. The same objections may, no doubt, be urged against a uniform horse-tax, as carriers and post-jobbers, although causing more destruction to public roads than farmers, would, nevertheless get quit for the same annual payment. But, in this case, the apparent injustice would be more than counterbalanced by a greater boon, viz., perfect liberty to travel at all times and in all directions without let or hindrance, or additional expense. A uniform rate on horses, in lieu of turnpikes and statute-labour assessments, offers freedom of locomotion to all classes, whatever be the mode of conveyance, and always admits of the shortest route being taken between any two points; whereas, under the present system, long *detours* are made by both and low, cadger and country gentleman, for the special purpose of evading

the toll-bar; thus rendering travelling more tedious, diminishing the turnpike revenue, and causing a greater, and necessarily more destructive, traffic on those very roads where toll is not exacted, and which, as before stated, are maintained by an annual rate per acre on occupiers of land. So far as our experience goes, this annual charge has never been viewed by farmers with the same hostility as the continual driblets exacted for the use of the turnpike roads; thus indirectly proving Mr. PAGAN's case, that an annual payment for the use of all roads would be far less obnoxious than the present system, with its heterogeneous compound of tolls and statute-labour assessments.

The following statement is designed to give a view of the comparative cost of supporting public roads in the case of two farms of 252 imperial acres each,—the first supposed to be so surrounded and hemmed in by toll-bars as to render it necessary for the occupier to pass through one or other of them with all the produce sent to market, and also in bringing back guano and other light manures, coals, &c. The second, situated in a district where the statute-labour roads suffice for the transit of all marketable produce to the place at which it is to be delivered. For the sake of perfect equality in the comparison, these farms are supposed to be cropped one-half in grain, and the other in Grass and green crops; or as follows: 42 acres of Wheat, 42 acres of Turnips, 42 acres of Barley, 42 acres of Grass, 42 acres of Oats, and 42 acres of Potatoes and Beans, or other leguminous crops. On the first of these farms the following quantities of agricultural produce will be sent to market, and pass through one toll-bar.

147 quarters of Wheat at 1*d.*	£0	12*s.*	3*d.*
189 quarters of Barley at ¾*d.*	0	12	7
168 quarters of Oats at ¾*d.*	0	9	5
80 tons of Potatoes at 6*d.*	2	0	0
18 tons of coals at 6*d.*	0	9	0
Gig tolls, say 52 days, at 9*d.*	1	19	0
Miscellaneous	1	0	0
Total for tolls	£7	2	3
Add statute-labour assessment, say 36*s.* (as in Fifeshire) per 63 statute acres	7	4	0
Total cost for maintaining public roads	£14	6	3
The other farm, situated in a statute-labour district, would pay only	7	4	0
Difference	£7	2	3

In the one case the charge for the use of the public roads amounts to 1*s.* 2*d.* per acre, while in the other it is only 7*d.* In ordinary cases, however, access to market by a statute-labour road can generally be obtained for part of the produce of a farm, which will so far lessen the expense; but, on the other hand, there are many instances where more than one toll-bar has to be passed through in going to market, and sooner or later this heavy impost will fall upon the land and come to be included in the rent, for all public burdens upon occupiers of land ultimately rest upon the shoulders of the landlords. The difficulty in the meantime is to get those who escape the toll-bars nearly scot free to agree to a reform which would undoubtedly saddle them with an additional expense for maintaining public roads. Let us contrast Mr. PAGAN's plan with the present turnpike and statute-labour system, in order to see how the result will affect the two cases assumed above—8 work horses and 1 saddle horse being supposed equal to the wants of a farm of 252 imperial acres.

1st Case.	£	*s.*	*d.*
Present system	14	6	3
Proposed plan, 9 horses 27*s.* 6*d.* per annum	12	7	6
Saving to the farmer during the currency of his lease	1	18	9
2d Case.			
Present system	7	6	0
Proposed plan	12	7	6
Additional expenses to the farmer during the currency of his lease	5	2	6
Turnpike expenses	£3	11	1½
Statute labour assessment	7	4	0
	10	15	1½
Mr. PAGAN's plan	12	7	6
Additional expense to the farmer during the currency of his lease	£1	12	4½

For this additional sum he is made free of the roads, and is saved the annoyance of turnpike keepers, loss of time in weighing loads, and the no small danger of backing horses with heavy loads upon a slippery cast-metal steelyard, merely that the toll-man may have it in his power to exact the uttermost farthing. It must be remembered, however, that in Mr. PAGAN's plan, as applicable to the locality (Fifeshire), the road system of which forms the ground-work of Mr. P.'s remarks, complete provision is made for redeeming a heavy road debt in 30 years, and for which purpose a sum of 5*s.* 6*d.* per horse is set apart. At the end of 30 years the rate per horse would be reduced to 22*s.*, so that then the comparison of the three assumed cases will stand thus:

1st Case.	£	*s.*	*d.*
Present system	£14	6	3
Charge 30 years hence, 9 horses, at 22*s.*	9	18	0
Saving	4	8	3
2d Case.			
Present system	7	4	0
30 years hence	9	18	0
Increase	2	14	0
3d, or average Case.			
Present system	10	15	1½
30 years hence	9	18	0
Saving	£0	17	1½

So far as the farmer is concerned these cases will have adjusted themselves long before this period arrives, as soon, in fact, as present leases expire, and new ones are entered upon.

Instead of the foregoing statements being purposely overdrawn, in order to exhibit Mr. PAGAN's plan in a more favourable light than it is entitled to, they are, we believe, much below the truth, for it will be observed that only 20*s.* is charged for miscellaneous articles passing through a turnpike; now wherever town manure, lime, or draining materials are required in large quantities the expense for tolls comes to be very high, and will far exceed the sum stated in the most extreme of the above mentioned cases. In Mr. PAGAN's work on "Road Reform," it is stated that Major ANDERSON, the convenor of the Fife road trustees' committee, called for returns from a number of the leading agriculturists in the different districts of the county, of their statute-labour and tolls and number of horses, and received returns from 29 individuals having among them 364 horses, and paying yearly of statute-labour and tolls, according to their computation, 690*l.* 0*s.* 6*d.*, equal to 1*l.* 17*s.* 10*d.* per horse. At 27*s.* 6*d.* per horse these parties, in the gross, would save 186*l.* 4*s.*, or about 27 per cent. Going into the individual cases, we find 22 of them paying more than that rate and seven of them less, viz.: 22 having 286 horses, 603*l.* 16*s.* 1*d.*, or 2*l.* 2*s.* 2*d.* per horse; and seven, having 78 horses, 86*l.* 4*s.* 5*d.*, or 1*l.* 2*s.* 1*d.* per horse.

If this statement be in any degree an approximation to the *average* cost to the farmers of Fife for the use of the public roads in that county, it proves that for one that would lose by the introduction of a uniform horse rate of 27*s.* 6*d.* per annum three would be gainers to a much greater amount; and that ultimately all would be more or less benefited.

However much the circumstances of the different road trusts throughout the country may vary as regards debt or other purely local incidents, the principle upon which a uniform horse rate is based admits of expansion or contraction to meet every supposable case. It is in fact the only one which by lopping off all useless appendages, in the shape of toll-keepers' profits, toll-houses, steelyards, litigation, &c., offers a simple and efficient means of removing debt, and ultimately cheapening and facilitating travelling throughout the country. This prospective view of the subject will probably not be so convincing to the minds of many as a more immediate saving to the pocket would have been; still, our duty does not end with taking care of our own interests; and truly our present road system, with its heavy debt in not a few cases, and its cumbrous machinery everywhere, is but a poor heritage to transmit from father to son. The *laissez faire* principle will not avail us much longer, for railways are revolutionising the traffic of the country everywhere, and well-known thoroughfares are fast being converted into green lanes, in consequence of the centres of traffic removing themselves to the various railway termini. No doubt the expense of maintaining these obsolete highways will be greatly lessened, but the toll-bars remain, the keepers must live, and it need not be matter of surprise, if by-and-bye the receipts on some deserted highway scarcely suffice to support these solitary Cerberi, far less to pay surveyors' salaries and interest on debt. *J.*

ON CONVERTING A MOORY HILL-SIDE INTO CATCH-MEADOW.

AT Lady-day, 1816, I began to farm 300 acres of land on Brendon-hill, the property of the Earl of Carnarvon, the elevation of which is 1000 feet above the sea; about 200 acres were then covered with Heath, 60 with Fern, and the remainder with peat and moss. Not having hay to give my horses, I began to turn my attention to procure some. The first course I took was to take the level from all the springs, and then to ascertain how many acres I had under that level that I could carry the water over, and when I found how much land I could irrigate, I began to cultivate my intended meadow, which was done by paring and burning, and, after spreading the ashes, to break up and work the land to the depth of from 12 to 15 inches with Finlayson's harrow, by stirring the subsoil, but not to bring it to the surface; after working many times over in this way, I got the surface as even as I thought necessary; it was then manured with 60 bushels of lime an acre, and sown with Turnips, which were fed off on the land. After the Turnips the land was again worked with the harrow, rolled, and made fine, and in April was sown with Grass seed, harrowed in and rolled. The Grass came up well, and was stocked on the 1st of July following with seven sheep to the acre, which it kept in good condition until the 1st of November, when it was again rolled, and the water gutters made to take the water that was drained from the springs above. I set out the watering gutters by the level, giving them 1 inch fall in every 10 feet. They were cut 9 inches wide and 3 inches deep. If the land has a gentle slope, the gutters may be put 60 feet from each other; but if it be very steep, and there is a good flow of water, they may be put 70 or 80 feet apart. When I find the water sink too fast into the land, I spread fine earth or road-scrapings over the surface, in order to fill it up, that the water may pass over to the next catch-gutter. In this way I made my first 14 acres, which took five years to complete. In the same manner I have, from time to time, drained all the wet land on the farm, and have now 30 acres of meadow, which yield a crop of hay from 1 to 1½ ton per acre annually.

Where it is possible to carry water over dry land, it is best to do so; but the bog itself can be converted into water meadow. I have lately drained a deep peat bog by cutting drains in some parts of it to the depth of 7 feet. This bog was 10 acres; one half of which is now watered. The way I manage to prevent the flooding water from getting down into the drains is as follows: I first fill the bottom with flat stones, set on their edge, one foot; then a foot of stones broken small; on them a 3-inch turf, with the Grass downwards, and well trodden in; on this turf I lay on puddle, which I bring within six inches of the surface. When this is done, I pare and burn, manure, and manage the peat in the same manner as I do the other land.

The water gutters should be cut with the under edge sloping outwards, in order to let the water flow more freely over the land, and be less liable to be trodden in by cattle or horses passing over them. The water should never be suffered to remain in one place over the Grass more than two or three days at a time without being changed, nor be turned upon the land in order to remain there during frost; but should the frost set in while the water is on, by no means alter it until the frost is gone; for if the surface is exposed, and the frost continues, it will, most likely, lift the land and kill the Grass. After the hay is made, I never stock the after Grass with anything but sheep, or cattle under two years old, feeding it down as close as possible by the 1st of November. I then clean the gutters and roll the land, in order to begin watering as soon as the springs begin to break in the autumn. November, February, and March are the best months for watering.

All the land on this farm was valued under an Inclosure Act, in 1804, by the surveyor, at 2*s.* an acre. What I have converted to meadow would now let for 25*s.*, and is still improving. The soil on this farm is part peat and bog, and brown loam, resting on gravel, and a soft, slaty rock. The Fern grows in the brown loam, which, on our moors, is by far the best land for water meadows.

The sides of the mountains in the north of England and Wales might be converted to catch-meadows in the same way that I have done mine, provided the water is of good quality, and the land can be made porous to let the water filter gently down. I have never found turning water over old pasture do much good, as the Grass that comes up is coarse and thin, and the hay, if mown, is not of good quality. If, therefore, old pasture is intended for meadow, it will answer best to break it up first, work it clean, manure it well, and seed it down with those Grass seeds that are most congenial for water meadows.

The first year's Expenses, per acre.			
Paring and burning	£1	0	0
Spreading ashes	0	1	6
Working land with Finlayson's harrow, 4 horses	1	5	0
Harrowing and rolling	0	5	0
Sixty bushels of lime, and carriage	2	5	0
Slaking and spreading lime	0	3	0
Turnip seed	0	2	0
Drill and harrowing in seed	0	3	0
Hoeing Turnips	0	5	0
	£5	9	3
Value of Turnips	3	3	0
First year's outlay	£2	6	3
Second Year.			
Cultivating after Turnips	0	10	0
One bushel of Rye-grass seed	0	5	0
12 lbs. of red and White Clover, at 10*d.* per lb	0	10	0
6 lbs. of Rib-grass seed, at 4*d.* per lb.	0	2	0
Sowing and harrowing in Grass seeds	0	2	6
Making water gutters	0	10	0
Two years' rent of land	0	15	0
	£5	1	0

Brought forward ...	£5	1	0
To keep of seven sheep from 1st July to 1st Nov., 16 weeks, at 8s. each	2	16	0
	£2	5	0
After Grass	0	5	0
Total expense of converting a waste mountain-side into water meadow	£2	0	0

The reason I did not plough the land after the ashes were spread, was that I wished to keep the vegetable matter that was on or near the surface, from getting down to mix with the subsoil. JOHN ROALES.

Note.—I have known Mr. Roales's farm for many years. It stands alone on the summit of the wild Exmoor range of mountain land. If any one asserted that, for a trifling outlay, he could enable heath-covered steeps to rival in produce and value the old grazing grounds of Northamptonshire, he would be regarded as a dreamer. But if any owner of moors will visit West Somerset or North Devon he will ascertain the literal truth of the statement, as I did five years ago. All that is required is a streamlet trickling down the mountain side, or a torrent descending rapidly along the bottom of the glen. The profit of underdraining old arable land appears trifling, when compared with the profit of thus forming catch-meadows, which, according to Mr. Roales, is more than one pound interest for two pounds invested. The two pages of this prize report, which state no more than Mr. Roales has himself done, contain a talisman, by which a mantle of luxuriant verdure might be spread over the mountain moors of Wales and Scotland, of Kerry and Connemara. If the plain means of improvement and employment are still neglected, it will be impossible not to tax the owners of these needless deserts with supineness; and difficult to deny that they hold in their hands more of this country's surface than they are able to manage for their own good or for the good of the community. *P. Pusey, in the Journal of the English Agricultural Society.*

Home Correspondence.

On English and Scotch Farming.—Having read and heard a great many contradictory statements on English and Scotch farming, and being practically acquainted with the system adopted in the leading counties of Scotland, I resolved to make a tour through England, to ascertain personally the difference in management, and to bring home what I considered any improvement; for as yet I never traversed any county or district but what I found something useful to be adopted, yet often have I conversed with persons who held that the farming in their district was superior to any elsewhere to be found. The reason why such persons hold that idea is obvious—they have never seen any other systems but their own—their own system is the best and worst they ever witnessed. I left Aberdeen on the 13th ult., sailed from thence per steamboat to Newcastle, after which I took my tour through the midland counties, but must say that I did not admire the state of agriculture in many of them. My objections are as follows. Fields too small, and surrounded by zig-zag hedges and trees. Ploughing very indifferently performed, not exceeding 4 inches deep; and in many places I observed three and four horses all in one plough not abreast, but in a row, with only the above-named depth of furrows. Very deficient in Turnip culture, the drills too narrow (where they do drill, but many of them sow on the flat). A great deal of their dung is left exposed on the surface. In short, Turnip husbandry is yet in its infancy with them generally; but on moving towards the metropolis, I found things in a different state, most especially in Hertford; there I spent some time, where information was to be found. The first place I had the pleasure of examining was the home farm of Cassiobury (proprietor Earl of Essex). This farm is under the management of Mr. Swanston; the appearance of all the crops was beautiful. The Turnips were laid down on the Scotch system; in short, the general management of the farm and stock gives praise to Mr. S., as one who thoroughly understands his business. The next farm I scrutinised was Sandingburgh, rented by John Kinder, Esq., from Lord Spencer, bailiff Mr. Hutcheon. The crops on this farm were altogether startling, being a thin gravelly soil, incumbent on chalk. On passing over the farm, I was led to ask what artificial manure was used, for I firmly asserted that such crops could not be raised on this soil without the aid of extraneous manures. To this Mr. H., replied, and I shall use his own words, "I have farmed Sandingburgh for nearly 20 years; all the artificial manure I have used has been small—some few cwt. of bones, and some of Lawes' manure for the Turnip crop (from the latter I derived no benefit). I have occasionally used some nitrate of soda as a top dressing, but not to any extent. I endeavour to preserve the manure of the farm, both solid and liquid; whether I do justice to the soil or not, the crop will tell." Had this account been given by any other person but the manager, I would have doubted its accuracy, for the crops were all good, most especially two fields of Wheat, in extent about 50 acres; the Wheat was then coming into ear, the average length exceeded 4 feet. After examining the crops, I was shown the herd of cattle, consisting mostly of short-horns, equalled by few and surpassed by none in England—symmetry, breeding, milk, and feeding properties, are all combined, which speaks volumes in favour of Mr. Hutcheon's skill as a breeder, being all descended from his own herd, and none of them ever were purchased at unwarrantable prices; and while he keeps up the breeding stock, he does not lose sight of feeding for the butcher; his bullocks he feeds off at two years old, at an average weight of 800 lbs., fed on the produce of the farm (given raw), with a little oilcake to finish off with. When a lot is sold, their stalls are filled in succession from the herd; if any are purchased it is in calves, which are purchased at 15*s.* or 20*s.*, and sold by two years at as many pounds, rather contradicting Mr. Mechi's statement, "that bullocks are ungrateful fellows." Part of his green crops are consumed by sheep on the land, which no doubt assists in keeping up the fertility of the soil; and on passing the dung yard, I observed a number of pigs. Remarking how he kept so many of these, to that Mr. H. replied, "Pigs have given me annually a profit of 200*l.*, so I keep them." *H., Aberdeenshire, July 7.*

Cumberland Carts.—We perceive that your correspondent "L.," is a great admirer of the Cumberland cart, and that he earnestly hopes Messrs. Ransome and May will exhibit specimens of this wonderful cart at the Exeter meeting of the present year. We know not whether Messrs. Ransome and May have any such intention, but we know, to our cost, that we have one of these celebrated carts on our premises, which has never been used, and which we shall be exceedingly happy to dispose of to "L.," or to any other gentleman, at much less price than it cost us to obtain it from its native hills. Fired by the glowing descriptions of "L." and other writers in the *Agricultural Gazette*, and also interested by the account given of these carts by Messrs. Ransome and May, we ordered one from a well known Cumberland maker, the price being 12*l.*, cash paid to him for it, besides an expensive freight to Bristol. We will say nothing of the merits of the article, but we shall be only too happy to sell it to "L." or any of his friends for 12*l.*, and for the future, at any rate, we shall be much more cautious in placing reliance on the descriptions of carts given by other persons. *Stratton, Hughes, and Co., Bristol.* [The price charged for this Cumberland cart, at the place of its nativity, being 12*l.*, we will build "L." or any of his friends any number of these carts, made in a very superior manner as to materials, but precisely pattern, as to shape and dimensions, for 11*l.* each cart. *S., H., and Co.*]

A Scotch Ewe was lost under the following circumstances. Appearing perfectly healthy, she was soon afterwards found dead. On *post mortem* inspection, the liver was perfectly sound, the lungs healthy, the bowels much distended with air, particularly the small intestines, which contained nothing else, and about six hours after death presented a sort of transparent appearance, and were of a greenish yellow colour. Although she was half fat, there was but little fat on the intestines. I find nearly all my neighbours have lost sheep more or less under similar circumstances, and the popular opinion is that they are poisoned by some herb or by something they get. I shall be obliged if any of your readers can give me any information on the subject. *Henry Chaytor, Croft, Darlington.*

Mr. Mechi's Pigs.—I never hunt in a pack, or I would reply to my esteemed friend Mr. Mechi's letter at some length; but as I find that he has castigators in another quarter, I merely state, that although I acknowledge I expressed myself in my article referring to him, published June 15th, as strongly as I could; yet I cannot retract a single remark I made referring to him. My friend's pigs were exactly in the state I described them to be in, notwithstanding the denial of my statements by his reverend correspondent. I am unwilling to repeat what I stated, but were I to appeal to my friend himself, and his numerous work-people, my friend would not deny, and his workpeople could not refute the veracity of my statements; I add, also, that although I made my statements on my own responsibility alone, Mr. Mechi has had many other visitors besides his reverend correspondent, and I have proofs in my possession from several of them, that they had witnessed with pain all that I described. I have also received several letters from well-wishers to my friend Mr. Mechi, but strangers to me, thanking me very courteously for the article which my reverend friend condemns. But my rev. opponent challenges me to a contest as to whether his or my crops are greater. Now I call to his recollection that my Barley is the third crop of Barley in succession in the same field, and that the seed for the present crop was only just half a bushel; and that for neither of the former crops did I exceed three pecks an acre, though my produce was eight quarters within a bushel. He will likewise call to mind that my Wheat crop is on the same land which is in part Wheat for the fourth time, and a part for the fifth time, in five years. He also ought to remember that the whole field was seeded with less than 1½ peck of seed Wheat per acre. If, therefore, I had failed in either or both these crops, a generous opponent would have lamented rather than have exulted over it. But I have not failed; and to show that I have not, I more than accept my reverend brother's challenge for a trial. But I must inform him and the public that I have had for many months a nominal wager, for a pair of gloves only, respecting my crop, the conditions of which, committed to writing, are held by an honourable baronet, who saw a part of my Wheat drilled with my drill; and he also will see it, or some one else in his behalf, measured and weighed, and I hope reaped also; and therefore I cannot alter the conditions of this wager. But if my reverend opponent, my friend Mr. Mechi's correspondent, will also enter the list against me, and on the same conditions, to prove to him that I do not fear the contest with him, I will lose my wager with him if I do not beat him by EIGHT bushels an acre. But the respective crops shall be reaped, threshed, measured, and weighed in the presence of umpires; and to show further that I am ready for the contest, my reverend opponent may choose three umpires for my one, or six for my two, or twelve for my four. And to show him further that I am not vainly boasting, I am sure of exceeding six quarters or 48 bushels an acre; and I think also I shall have seven quarters or 56 bushels an acre, and from a peck and a half of seed only, or 149 times the seed I used, though the general average of the produce of England does not exceed 11-fold, or 11 times more than the seed used. *Geo. Wilkins.*

Societies.

ANNUAL MEETING OF THE ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

(*Resumed from page* 462.)

THE SHOW OF PIGS on this occasion was a very satisfactory one, both in point of numbers and quality, there being 114 entries and 152 animals exhibited, comprising the best specimens of the several fashionable breeds—the Yorkshire, Cumberland, Tamworth, Leicester, Berkshire, and Essex, with their sub-varieties of large and small breeds. Owing to the variety of breeds of pigs which come into competition with each other, a peculiar degree of interest attaches to this part of the annual exhibition of the Society. In most other classes the competition is confined to animals of some particular breed. To be devoid of the characteristics of that breed, however rare may be the merits of animals in all other points, is fatal to its chance of success. The best Leicester would be no-where if entered out of his own class in a mediocre lot of long-wools, and a superb short-horn would be cast, if placed alongside an ordinary Devon, in a class professedly of the Devon breed.

In pigs, however, the Cumberland, Yorkshire, Tamworth, and Berkshire compete for the large breed, and the Essex, Yorkshire, Leicester, and Berkshire, are antagonists upon equal footing for the honours of the small breed; and the animals that approach the nearest the ideal standard of excellence in the several points of symmetry, quality, and size, receive the honour due to merit, from whatever stock these excellences may have been derived. If we refer to previous meetings we shall find that these honours are far from hereditary, and have been conferred upon the scions of each and every one of the houses that give their names to families.

It might seem difficult to an ordinary observer to do justice in this "war of the races," to the claims of animals possesed of such distinct characteristics as the several breeds are, but this is imaginary. The test of form and quality in all breeds is uniform. There is but one formation that indicates the highest order of fattening power—but one that bespeaks milking qualities—"quality" is distinguishable, whatever the colour of the skin. The form therefore that exhibits the nearest approach to that which bespeaks excellence, and which, by shape and touch, offers the most indications of quality, is the one which, whatever may be its local habitation or name, receives the prize.

On the present occasion it will be seen that the Yorkshire and Leicester breeds have been the most successful; the prizes for large boars and sows having been awarded to the Yorkshire and Cumberland white pig. While, for small breed, the whole of the prizes have been obtained by the black Leicesters; and it is worthy of notice that the first prize small boar, the first prize small sow, and one highly commended, are all from one village (Lifton, Devon), and two of them the property of one person, Mr. Richard Bartlett. While the highly commended animals of this class are all of the "Yorkshire lot;" Nos. 525 and 574, by Mr. Tuley; 569, Mr. Stainsby, Leeds; 568, bred by Mr. Atkinson, Leeds; 519, Mr. Savery's, Exeter, bred by Mr. Forster, Woodhouse, Leeds.

The Tamworth pigs obtained a prize for large breed. Competition was small in this class, and the animal had rare merit in size and milking qualities, as evidenced by a beautiful litter of pigs. The Tamworth pig does not, however, possess the proper form for fattening, but has the thin long head, light neck and shoulders that bespeak them good wet nurses. They have size too, and, for so large a pig, the merit of uniformity and good quality of skin and hair. Against the Yorkshire and Cumberland pig, possessing quality and size in an equal degree, and greater width of head and shoulder, they can never prevail where competition is at all extensive.

With the exception of the prize for three young sows, the Essex blood was unsuccessful. A few commendations were awarded to them in the small breed classes. The Berkshires were also still more unsuccessful. The Essex pigs have fine quality, exhibit signs of pure breeding both in hair, bone, and figure; but cannot equal either the Leicester or Yorkshire Short-ear in width of shoulder, levelness of back, or breadth and shortness of face. The superiority of the Leicesters and Yorkshires in length and width of body, evenness of form, and shape of head, was very visible on this occasion. The Berkshires are much too coarse in bone and hair for the small breeds, and have not sufficient size for the large; yet amongst them are very many symmetrical animals.

We have scarcely time to notice singly the animals that struck us most. The class of large boars was not numerous, 11 being exhibited. The prize boar, belonging to Mr. Moses Cartwright, of Burton-on-Trent, of the Cumberland or Yorkshire breed, is of beautiful symmetry—perfect back and loins, good head, but is scarcely up to our idea in size, nor equal to boars of the same breed that have won on other occasions. His girth is 69 inches, age 1 year 7 months. The second prize, belonging to Mr. Ley, of Trehill, Exeter, was bred by Lord Wenlock, York; and is a fine old pig, showing, however, marks of age. Mr. Stainsby's young boar (487), highly commended, is a prime animal, both in blood and looks, with the exception of his hind legs, that have gone too much under him.

In the boars of a small breed (494), Mr. Lifton's 9 months old Leicester, girths 57 inches, and measures 52 from ear to tail. The head of this animal is perfection, his ham is equally correct. Nothing can much surpass the outline of his form. His width of loin and rump are extraordinary. The second prize, Mr. Radmore, Thorveston, Devon, a Leicester (517), 10 months, is larger than the winner, girth 60 inches, length 57, but he is not so even in form nor so rich in quality. This pig's back is good as possible, his face is longer than that of the other pig, and his hind quarter droops. This gives too much curvature to the back. In this class are several other first-class animals. No. 525, 1 year 3 months, Mr. Tuley's (Keighley) is one of the

finest animals in the yard. His sides and top, from ear to tail, are perfectly straight—nothing equal to them in the yard. He has, however, a slight deficiency in quality to the touch; his head is scarcely correct, and is not quite fine enough to compete for small breed with the full blood Leicester. His girth is 60 inches and length 57 inches. Mr. Maws (Tetley Crowle, Lincoln) boar (510) is an astonishing animal. He has too much hair for a competition of this sort, and is rather too round in the back and strong in the bone; otherwise, so far as regards plumpness of form, and perfect evenness of outline, he excels everything in the yard. Rotundity is his characteristic, to a higher degree than any other animal. His girth is 69 inches, and length 57, being 12 inches more in girth than the prize animal, and same girth as first prize *large* breed. Mr. Savery's boar (518) is deficient in his forerib, to an extent that disqualifies him altogether in a competition of this sort. Two boars of Mr. Fisher Hobbs', Nos. 510 and 511 are commended. No. 508 is a neat pig, but small and light in the fore-quarter, and the head is not broad enough.

The large bred sows are not first-rate. Mr. Tuley's prize sow (536), although much before her competitors, is but a moderate substitute for the noble animal with which he took the same prize last year at Norwich.

Sows of the small breed were an extraordinary class; 38 were exhibited. The judges report that the competition was almost unprecedented. It is a pity that in such a class there was only one prize. The fortunate animal in this class, belonging to Mr. Northey, Lifton, Devon, is 1 year and 5 months old, and girths 63 inches. She has great length; head and shoulders, sides and hams, are superb. From front or behind she is the best-looking pig we have ever seen; her back, however, is, if anything, weak, which arises from her being longer than some animals of this class by an inch or two. The immense circle formed by her head, cheeks, and shoulder, and that by her hind quarters, are alike unequalled in the yard. Mr. Stainsby's sow (569) highly commended, is a model, and in our opinion stands next the winner. Mr. Tuley's, 574, is very large and handsome, but scarcely fine enough in bone for this class; she girths 66 inches, and is highly commended. Mr. Bartlett, of Lifton, owner of first prize, small boar, has also a splendid sow in this class, No. 545; she is highly commended, and deserves it, as she runs close upon those mentioned before her. A small Essex (559), 9 months, belonging to Mr. Moon, of Lapford, was almost as broad as long, wonderfully fat, fine quality, but too short in the side for breeding purposes; her girth was 58 inches. The young sow, 563, belonging to Mr. Savery, of Silverton, Exeter, and bred by Mr. J. R. W. Atkinson, Leeds, has one of the best natural forms in the yard. It was not at all fed up, and will one day make a splendid sow, if her hind legs do not get crooked. The several other sows that were commended were principally of the Essex breed; amongst which Mr. Hobbs had (557) a neat 7 months old sow; and Mr. Phillips, Totness, had a very fine Yorkshire sow, aged 10 months (565). This animal was lame.

The breeding sow pigs of large breed were not very noticeable. The first prize Tamworth pigs (576) are wonderfully large for the age stated in the entry (7 months 1 week), but have all the failings of the breed, and are lean and long in the fore quarter. The second premium, Mr. Trollers, of Durham, had two good pigs, and one very coarse animal. Mr. Tuley's pigs, 22 weeks old, are too small to show against the above, but are animals of a much higher quality.

Breeding sows of a small breed were an excellent class. Mr. Turner's (1st prize) animals are well entitled to it. Mr. Catherall's, of Mold, Flint (583), 33 weeks and 2 days white Yorkshire small breed have great beauty, and the highest possible quality. There is one in the lot scarcely equal to the other two, and they have less size than the winners. Mr. Fisher Hobbs' 30 weeks old (586) were commended, and are very pretty animals. They are, however, well beat by Mr. Turner's.

In Extra Stock, Mr. Stainsby's (Leeds) three sow pigs, large breed, 9 months, were entitled to the highest commendation; had they been eligible for the premium for three sow pigs, they would no doubt have out-distanced the Tamworth sisters.

SHEEP. — We continue our report of this part f the Exhibition from last week. In Longwools, the prize of 20*l.* was given to 458, a 16 months old ram, bred by Mr. Hewer, of Ley Gore, Gloucestershire. This animal is of immense size, has a very good fore-quarter, a wonderful cushion, very fat back, and a good curly fleece. The prize of 10*l.* was awarded to 453, same age, bred by Mr. Garne, of Adsworth, Gloucestershire. This sheep is nearly perfect in form; he has an extraordinarily forward, full, and deep breast, great depth of carcase, broad chine and plates, a beautiful back, and wool good though not very plentiful. 459 was highly commended, belonging to Mr. Hewer. It is remarkable for width, has a thick scrag, full plates, good rump, and a back free from the usual defect of Cotswold sheep, viz., a high point immediately in front of the loin. 463, Mr. Large's sheep, was commended; it has great breadth, amazing width of chine and plates, beautiful back, curly staple, but a falling off in the rump. We noticed also 449, a sheep of Mr. Cother's, of Woodstock, Oxon, a well made animal, with a close thick-set fleece. 455, Mr. Garne's sheep, very high-standing, with good rump, firm handling, but with a neck too long, and ribs not out-springing enough to carry off a prize. 456, Mr. Handy's ram, of Sevenhampton, Gloucestershire, a very pretty sheep, but too small, and rather narrow towards the rump.

Class II. RAMS OF ANY OTHER AGE.—Though we may be astonished at the immense bulk attained by sheep in 16 months from their birth, it is in this class that the greatest size is beheld. Mr. Garne's ram, 467, 40 months old, which obtained the prize of 20*l.*, is very big, and beautiful in every point, having an especially good neck. The prize of 10*l.* was awarded to 471, bred by Mr. Lane, of Eastington, Gloucestershire. It is 52 months old, a most extraordinary animal, of immense frame, very broad, full, and deep chest, colossal neck, great overhanging cushion; weighing probably 80 lbs. per qr., yet having a very small head and marvellously thin bone. 473. A 52 months old ram, bred by the same gentleman, was highly commended. It is a magnificent ram, having a wide carcase, full plates, thick scrag, heavy overhanging rump, and light offal; being broad enough to be worthy of a prize, though hardly fine enough in quality to take it. 466. Mr. Garne's sheep 40 months old was commended. A very long and wide sheep, with an excellent back and good fore-quarter.

Class III. SHEARLING EWES.—The prize of 10*l.* was awarded to 476, Mr. Large's pen of ewes (Broadwell, Oxon). They are superior ewes, with beautiful quality of mutton; in shape exceedingly good, being wide, round, deep, large, with plenty of good wool. The prize of 5*l.* was obtained by 477, Mr. Large's ewes, beautiful animals, but little inferior to the first lot; they have good wool, but are not altogether so good in quality as their more successful companions. 478. Ewes bred by Mr. Wippell, of Brenton Barton, near Exeter, have good backs, covered with a thickset staple of wool; but loins and chines hardly wide enough to win.

In EXTRA STOCK we observed No. 604, a pen of five Exmoor ewes, from four to seven years old, excellent animals of their class, but such as do not show well beside the straight-backed, compact, Leicester, and long-woolled sheep. 605. A pen of five horned ewes, four years and four months old, bred by Mr. Coombe, of Creech, Somerset, were highly commended, being of great size and very superior quality.

We have thus noticed some of the chief attractions of the sheep show, and though we have spoken dogmatically as to the character of the animals, we wish it to be understood that our remarks are intended to express only our own opinion. In conclusion, the exhibition was super-excellent, especially in the Southdown classes; whilst the Leicester and Longwools displayed a marked improvement upon last year. *C.*

In our report of Sheep last year we endeavoured to show, by means of tabular statements, what were the general results at which we had arrived, after watching the progress of the Society in the department of sheep-breeding. From a comparison, exhibiting the annual increase in the number of animals exhibited, we inferred that first-class sheep were more numerous in the kingdom than formerly. And we expressed our belief that the "model animals" were each year better in form and quality than the last; since not only had the great victors at the exhibitions been constantly improving their stock, but other breeders of new renown were frequently stepping in to deprive them of their honours. This point was illustrated by a comparative list of the prizemen in 1847-8-9. And by another table of measurements we showed that the prize animals of 1849 were of larger size than those of 1848, indicating the progress of breeders in the task of augmenting the frame without losing the quality of the sheep. We intend here to convey information upon other points of interest in the same concise manner; our first table setting forth the respective numbers of sheep exhibited in the years 1847-50.

The next is a synopsis of the names and counties of the prizemen for the last few years, showing that the Leicesters of the northern counties occasionally excel those of the midland districts; that the Southdowns of the southern counties share honours with those of the eastern counties, and that the Cotswold district is all-powerful in longwools.

The next list shows the fluctuation in the number of exhibitors, and it will be seen what a large number of breeders avail themselves of the proximity of the country meeting to their farms. The exhibition of his best animals in the great competition-ground of the Society cannot but prove advantageous to the breeder, whether he be successful or not; the character of his breed being there made known to the public, and the comparative merits of his favourites tested in juxta-position with the *elite* animals of the kingdom. From the following Table it appears that this benefit is obtained by many breeders who would not have enjoyed the opportunity of receiving it unless the show-yard had been placed within a comparatively short distance of their dwellings. This is one of the abundant benefits resulting from the visits of the Society to different localities of the kingdom. The first four lines show the number of exhibitors in each of the counties where the meeting has been held, from which may be seen the extent of the benefit above-mentioned, and the relative spirit with which the breeders of the several counties have seconded at succeeding meetings their initiatory exposition at their county town.

Number of Exhibitors residing in each county sending Sheep to the respective Shows in 1847 to 1850.

Horses.—Bearing in mind the fact that Devonshire is not distinguished for its breed of horses, and that very few of the heavy kind are reared within its limits, the show of horses was not only very respectable, but surpassed our expectations; for although the class for agricultural stallions of any age, as well as that for 2-year-olds were both inferior to these classes at Norwich, York, and Northampton, yet on the other hand the classes for mares and foals, as well as that for 2-year-old fillies, we believe surpassed those of any former show. In Class I. we noticed a dark chesnut 5-year-old horse of the Suffolk breed, No. 234, to which the first prize was deservedly awarded. This animal exhibits considerable substance, powerful quarters, with good shoulders and fore-legs, conjoined with symmetry and action. We understand this animal was shown at Norwich in the class for dray-horses, and not being a horse of this character, failed in obtaining a prize which perhaps he might otherwise have secured. The second prize horse, No. 233, also a Suffolk, was superior to the former as respects the back and loins, which were perfect, but inferior in other respects. This horse we find obtained the second prize at York. Closely rivalling these horses was No. 246, a roan horse of great size, strength, symmetry, and activity, and which well merited the high commendation he received. Probably his great weight, and a little coarseness about the legs, debarred him from receiving a prize. In this class we also noticed a very fine brown stallion, No. 253; an active and very useful young grey horse, No. 251, as well as an exceedingly compact and active black horse, whose merits almost made us forgive his white and hairy legs, so peculiar to his breed.

In the class for two years, we find the prize animal is No. 255, the first in the class, and, if we do not greatly mistake, this fine young horse is not only Number 1 as regards the class to which he belongs, but also as respects the show of horses altogether. Size, strength, and symmetry are here admirably united; the fore legs flat and clean, and the feet good, with remarkably good action. This horse, we are pleased to find, is by the prize horse at the Northampton meeting, one of the finest (then) four years old horses we ever remember seeing. The second prize in this class was taken by a Suffolk, a very handsome animal.

The class for Roadster Stallions, though inferior to that at the York meeting, was superior to this class at several other shows. The prize was awarded to No. 267, a handsome compact grey horse, displaying considerable breeding, and with superior action. This horse we understand has carried the Queen's huntsman five successive seasons. A fine three years old horse, No. 267, is highly commended in this class, and a handsome dark brown stallion, No. 271, possessing great substance, is also well worthy of commendation.

We now come to the other sex, being Class IV., for Mares and Foals for agricultural purposes; and here, as well as in the next class, the Suffolks reign supreme, taking both first and second prizes; and here we may well pause for a moment, to inquire how it is that the Suffolks are so successful in obtaining prizes at these shows,—a question which we feel no difficulty in answering, inasmuch as the class we are now noticing affords a striking proof of the justness of the explanation we have to offer; viz., that it is by the most rigid attention to the excellence of their mares, that the Suffolk breeders are enabled to rear such very superior horses as they succeed in producing. Any man, by the payment of the requisite fee, can avail himself of a first-rate horse, but it requires 50 or 100 times the amount of such fee to procure a mare equal to such horse, in all respects; (100*l.* was the price asked for No. 282, the mare to which the first prize was awarded, and 50*l.* for the foal.) There is no peculiar virtue in the colour of the Suffolks; indeed, we would prefer a dark-bay or brown; but it is that animals of this peculiar colour have received very great attention, and in consequence have been considerably improved. With respect to the prize mare, it would be difficult, indeed, to point out any fault she possesses. Size, strength, symmetry, and activity are here admirably united. No. 272 is also a very superior animal, and is closely rivalled by No. 279, a fine brown mare, with a capital foal by her side. Nos. 277 and 280 are also very good animals. Class V., for two years old Fillies, displayed some capital animals (mostly Suffolks), the prize being given to No. 284, a very perfect filly; and the second prize to No. 286, a very symmetrical animal, though somewhat deficient below the knee. Between the last-mentioned and No. 287 the competition must have been very great, whilst No. 283 was also deservedly commended. One improvement we noticed in the horses exhibited at this show, which is, that they were not so immoderately loaded with fat as at Norwich, and some former shows. *W. C. S.*

Upwards of 1000 guests sat down to a dinner provided by M. Soyer, and, as might have been therefore expected, far superior to the dinners which have generally been provided on these occasions. The Marquis of Downshire presided; the place, as vice-chairman, of the Duke of Richmond, who was unfortunately absent, being supplied by the Earl of Chichester. The speeches of their excellencies, Mr. Lawrence and Mr. Rives, ambassadors from the United States of America to England and France respectively, were much applauded. Probably the ablest and most useful address, however, upon the occasion was that of Lord Wodehouse, who, in advocating the toast of "the labourer," entered into the subjects of emigration and education as bearing upon pauperism. Towards the end of the meeting considerable confusion prevailed, and the length of the speeches delayed the proceedings till after dark.

Reviews.

Ireland's Only Safety, the Improvement of its Waste Lands. By Law. Rawstorne, Esq. Pp. 24. Longman, Brown, Green, and Longmans.

The author here argues for the enlargement of the area of cultivation up to the extent of the population, and against lowering the amount of the population down to the capacity of the soil. Emigration, as it has hitherto proceeded, is depriving the country of its best men—of those who, having capital, and knowing how to apply it, are precisely the men whom Ireland wants. And the remedies Mr. Rawstorne would propose for the pauperism which seems about to swallow up the Irish common people altogether, are Government interference for the reclamation of waste lands, and the application of the labour-rate in a modified form for the support of labouring poor. The evils which are generally supposed to attend the adoption of the latter part of this plan he believes might be avoided:

"When Captain Cragie, in the Orkneys, in the first year of the famine, began to give unlimited work to the indigent people, he found large bodies of them flocking together from all quarters to get a share of the Government money. The fisheries were deserted, all the common employments stopped. The following year he instituted a destitution rate, and the plan worked admirably. If this would do so in one instance, why may it not act equally well in another; and is there any other reason for not giving it a trial in Ireland, except that the extent of the calamity would require some additional restrictions? That a labour-rate in a workhouse must necessarily act injuriously, can never be allowed, nor will it be likely to be asserted by any except by those who have seen it tried under some peculiar disadvantages. The Union of Chorlton-cum-Medlock, close to Manchester, consists of a manufacturing population exceeding 80,000 persons. When the writer of this visited it many years ago, he found in the house very few except some old and infirm paupers. A piece of moss land had been taken from Sir Thos. De Trafford, on which the able-bodied were set to work at reduced wages. The effect of this was that every man looked out for work for himself elsewhere, and did not trouble the town longer than he could possibly help."

The following are some of the details of the author's plan: "Let land be attached to every workhouse in Ireland, not less than 200 acres to each, and as much more as circumstances will allow. * * * The governor of the workhouse should have nothing to do with the work in progress on the land; but under the guardians should only select and supply such a number of labourers as might at any time be required. The advantage of a measure like this would be twofold; it would lower rates, and raise wages. In any legislation these should be the first things aimed at. Past legislation has rather taken a line in an opposite direction. By the ill-working of the Poor-law the rates have been swelled out so as to reach, in some cases, nearly the amount of rent."

Caird's High Farming Harrowed. By Cato the Censor. Reprinted from "Blackwood's Magazine."

We have been favoured with a copy of this reprint. The article was written by one who, whether he possesses it or not, at any rate exhibits plenty of the self-sufficiency and vanity which it seems to have been the main object of his criticism to prove against Mr. Caird. The "harrowing" has indeed quite as effectually exhibited the faults of the implement as the quality of the soil whose surface it has endeavoured to remove; and it may be doubted whether the machine in question was a *bonâ fide* agricultural implement at all, and not, rather, a contrivance like the teazel-frame of our woollen manufacture, which, however well fitted for scratching and scarifying the matters coming within the scope of its ordinary operation, is entirely at fault when set to deal with an *agricultural* subject. The principles for which Mr. Caird has manfully contended will survive the sarcasm here directed against its advocate; and the frequent possibility of farming profitably under low prices, where energy and intelligence are at hand to take every advantage of circumstances, is a truth nowhere better or more usefully illustrated than in the pages which "Cato the Censor" has here unsuccessfully attempted to laugh to scorn.

Miscellaneous.

Cattle Insurance.—Mr. Samuel Cary Richards lately made the following judicious remarks on the subject of Cattle Insurance at the Yeovil Agricultural Meeting. "This was a question of great importance to farmers and to landowners; it had already attracted much notice, but not by any means to the extent it deserved. All descriptions of live stock were now insured, as would be seen by a notice advertised in the *Yeovil Times* and other respectable newspapers; and to such an extent had this kind of insurance already been carried, in the office referred to, that the average, for the last three years, had been upwards of 50,000*l.* per week—the startling sum of 2,500,000*l.* per annum; and, to show its value to the farmer, it would be only necessary to state that the Insurance Company had paid, during the last year, for losses of stock, no less a sum than 70,000*l.* It appeared that there were, in England, Scotland, and Ireland 2,250,000 horses, of the total value of 67,000,000*l.*, of which more than 1,500,000 were used in agriculture, and that their value was 45,000,000*l.* The number of black cattle in the kingdom was about 14,000,000 to 15,000,000, of the value of 216,000,000*l.*; the number of sheep 50,000,000, whose value was estimated at 67,000,000*l.*; and the extent of capital invested in swine was still more extraordinary, when they reflected how little it was thought upon, or taken into account. The number of pigs, of all ages, breeding and rearing, was calculated to be upwards of 1,000,000, which, taking one-third at 2*l.* each, and the remainder at 10*s.* each, gave a value of 18,870,000*l.*, as the capital invested in pigs alone, making the total amount of capital in the above species of agricultural stock 346,270,000*l.* If to this was added the annual value of the crops, the capital in the hands of the farmers in the shape of live stock, and the produce of the earth could not, at a moderate computation, be estimated at less than 600 millions of pounds! He thought it was unnecessary for him to say another word upon the importance of insuring stock."

The Highland Society's Exhibition at Glasgow.—Now that the booking of the cattle and implements is fully completed, we learn that the demonstration will even exceed that at Glasgow in 1844, which was the largest the Society has ever yet had. It will exceed it in point of number, and in quality will very greatly surpass it. On that occasion the Society exhibited fat stock, crosses, and animals of all sorts; it now restricts itself to breeding-stock of the pure races, and of specified and proper ages. The number of cattle is about equal to that of 1844, but for the reasons above stated, the exhibition will be better. It will also be less exclusively local and Ayrshire, the proportions of the different breeds being better divided. For instance, there are more than 100 short-horns, embracing the best blood among the bulls of England. This is chiefly caused, we presume, by the sweepstakes for short-horn bulls, the plate for which is worth 70 guineas. The show of sheep will be enormous; swine very good; poultry large; horses 170. In butter there are some 240 entries, besides cheese. The show of implements will exceed anything yet seen in Scotland; some 500 articles have been entered. On the evening of the first day of the show, namely, Wednesday, the 31st instant, Dr. Anderson, the able chemist of the Society, will lecture on an agricultural-chemical subject in the Merchants'-hall. On Thursday is the great dinner, which is to be provided by Messrs. M'Lerie and Co., at 8*s.* a head—his Grace the Duke of Roxburgh in the chair, and the Duke of Argyll croupier. On Friday morning, the last day of the show, there will be a public breakfast and *conversacione*. All the arrangements appear to be made in the best possible manner, and promise a "glorious three days" to all who are interested in agri-

cultural subjects. We may remark, in conclusion, that the head quarters for the committee and judges is the "New Queen's Hotel," George-square.—*From the Glasgow Reformer's Gazette, July* 6.

Haymaking.—The best farmers put it through the following process. Suppose the weather fine, all the Grass cut before noon, and in the afternoon of the preceding day, is very well shaked out by hand (not with a pitchfork) so that scarcely two straws together lie in the same direction. That part which was shaked out before 10 o'clock is turned over before dinner, and the remainder immediately after dinner. The whole is turned over again before 4 o'clock. Then before 7 o'clock (before any dew falls) the whole is made into foot coils with the rake and foot. After the dew is off next morning it is well shaked out again, with the hand, into plots; the intervals narrow, or wide, according to the weight of the crop. Then turned over before dinner, shaked out again after dinner, turned over again by 4 o'clock, then made into wind-rows of five or seven turnings each, and put into cocks of about 1 cwt. each. Next day shaked out and turned before dinner, and after dinner turned over again, being then made into large wind-rows, and carted to barn or stack; or, made into big cocks of 5 or 6 cwt. each, to be carted the first opportunity. Care is taken to cock up every night before the dew falls, which is of considerable importance in making good hay. Neither should the sun be allowed to burn one part by its lying undisturbed half or a whole day. By this mode hay is made in one or two days less time than by a more careless manner of making. In showery weather the farmer has to be exceedingly watchful to see that it is always put into cock before rain. In other parts of the country far less care is taken in haymaking, but I am quite satisfied to the loss of the farmer. Very frequently allowing it to lie in the swarth a whole day, and sometimes in showery weather several days; and the same also when spread out. A saving of wages seems to be the principal object of the farmer more than making good hay. No importance is attached to its being wet with dew in the night, or scorched with sun in the day; and very little importance to its being wet with rain, when after the process is advanced. What would a housewife think of having her tea watered, and perhaps remaining in a damp or wet state for a day or two, and then dried before being put into the tea-pot for use? It should be borne in mind that dew, when the Grass is made into hay, will do the same damage as rain. I have seen hay cut from two adjoining meadows, but belonging to different farmers; the natural qualities of the Grass the same in both, and both cut on the same day; yet, from management alone, I calculated the difference in value when carted at 50*s.* per acre. *Rothwell's Ag. of Lancashire.*

Mr. Mechi's Farm.—As my farming operations are now public property, I invite inspection of my growing crops, in justification and verification of the opinion I expressed years since, that the poor and other lands of this kingdom, if properly drained, cultivated, and manured, would amply and superabundantly feed and employ our population, independently of any foreign supplies. The question of individual profit will be tested by the annual publication of my accounts. *J. J. Mechi, Tiptree-hall, near Kelvedon, Essex, July* 1.

Calendar of Operations.

JULY.

LAMMERMUIR SHEEP FARM, *July* 9.—The past fortnight has been a busy one with our shepherds—sheep shearing having been general in our district. Ours was completed yesterday. The practice here is for neighbours to assist each other, and to have the days previously arranged, to avoid confusion. Some three or four days before being shorn, the sheep are washed by swimming them three or four times through a deep pool from 15 to 20 yards broad; and that they may be thoroughly wet over the back, the rock or pier from which they leap should be at least 3 feet above the water. This may appear a somewhat primitive mode of doing the work, but having compared sheep thus treated with others which had been "hand washed," we find their wool as clean as it can possibly be made by any process of washing performed while on the animals' backs, while the time occupied is one-third shorter, with infinitely less labour to man and beast. As we endeavour to finish the shearing of each lot the same day it is begun, that the sheep may be as little disturbed as possible, and allowing from 50 to 60 sheep per day to each man, we make a point of having a sufficient number of hands provided. The sheep are either laid upon stools or a piece of clean turf; in the former case, the animal's legs are tied with a worsted cord, to prevent cutting, and the shears run along the side. We prefer this method. Whenever the fleece is removed, the "buist" or mark, expressive of the owner's initials, is stamped on the sheep, a kettle of warm pitch being kept close at hand for this purpose. The wool is carried to a building, where it is carefully examined, and all extraneous matter removed, and then rolled up. The thinning of Turnips has occupied all our hands for three weeks past. We expect to finish in a few days. They are now all ready, and, in general, growing satisfactorily. Oats are looking well, and coming into ear. Hay will be a light crop; we purpose beginning the cutting of the sown Grass next week. *A Lammermuir Sheep Farmer.*

Notices to Correspondents.

CLOVER: *X Y Z.* We should suppose the affair to have arisen accidentally. The Hop Trefoil has a seed somewhat like that of the red Clover. Your loss is just the difference between the crop you have and that which you probably would have had, calculated in tons of hay, at so much per ton.

CYCLOPEDIA OF AGRICULTURE: *A B.* Seven parts have appeared. Apply to Messrs. Blackie, Glasgow.

EXTRAORDINARY CASE OF A COW: In the first stage of disease the animal was deadly cold and trembling all over, with a stoppage in the bowels, and very much swollen. In about two hours after she was in the greatest agony, with her tongue out of her mouth to a great length, moaning and groaning, and very restless—All very unusual for a bullock. All medical treatment was quite useless. In 24 hours she died, and when opened one lung had perished and completely gone, and in the cavity of the chest was found a large quantity of blood and the rotten parts of the lung. The other lung and the bowels appeared to be in a perfect healthy state. [The case is certainly extraordinary and unusual. We imagine there must have been previous disease of the lung. *W. C. S.*]

INFLAMMATION OF THE BOWELS IN PIGS: *D A M.* Pigs may be bled from a vein inside the arm; they will also bleed with tolerable freedom if a portion of the tail is cut off. The disease in your case may probably be traced to some errors in feeding. Bleeding and oily laxatives, followed by doses of calomel and opium, and tartarised antimony in doses of 2 grains each for young pigs, and more for older ones. Young pigs might also be put in a tub of warm water with advantage. *W. C. S.*

LIME-WATER FOR BOILERS: *Const. Sub.* See p. 163, *Gard. Chron.* 1846. Put some muriate of ammonia into the water—about 1 lb. to 1000 gallons. It will hinder the deposit of lime, by converting the insoluble carbonate of lime into the soluble muriate.

OVERHANGING HEDGES: *J F.* The distance to which your property extends on the outside of your fence varies in different districts. We understand it to be 4 feet in our neighbourhood; and we imagine that we have no right to allow our hedgerow timber to overhang that limit. These are matters, however, on which a legal opinion is necessary, and that we cannot give.

PERIOD OF HARVEST: *Gallicus* asks, would it not be interesting if your correspondents in various parts of the country would inform you of the date of the first cutting of Wheat in their neighbourhoods, soil, and course of cultivation, and manure?

SKIN DISEASE IN A COW: *W D C.* Common mercurial ointment, diluted two-thirds by lard, will form the best application to the skin of your first case. In the second case we imagine the teeth may be out of order, and require examination. If this is not found to be the case, give a dose of salts with half an ounce of pimento, as the digestive organs may be out of order. *W. C. S.*

SOUTHDOWN SHEEP: *A Young Farmer* would be much obliged to any of our correspondents who would give him the result of his experience in fattening southdown sheep, and a calculation of the expense. [See vol. vii., p. 294, English Agricultural Society's Journal.]

THISTLES: *Enquirer.* Certainly. Continue pulling and they will disappear. About lime kilns—hereafter.

TRANSMUTATION OF GRAIN: *W B.* The Grass you have sent is the Phleum pratense (common Catstail Grass), plentiful everywhere in pastures, meadows, fields, waste ground, &c. It belongs to a genus as distinct from Triticum as Felis from Canis, and we should as soon expect to find a bitch producing a litter of kittens as a grain of Wheat giving rise to one of these Catstails. We every now and then see speculations about one kind of grain changing into another, and wonderful theories propounded in consequence by those who trust the parties that put forth these statements; but for our own part we do not believe there is a single trustworthy statement on record that ought to incline us to believe anything of the sort. Botanists have not yet ascertained the laws which limit the variations in form to which given species may be subject, and thus probably multiply species beyond all increase from Nature; but this is a very different question from that which supposes a change from one well marked genus into another, or even a species of one tribe into a species of another tribe. We can only suppose, in the present case, that your field was full of the seeds of Catstail, or your Wheat seed foul with them. *J. S. H.*

*** Communications reaching town after Wednesday cannot be answered the same week.

Markets.

SMITHFIELD, MONDAY, July 22.

The number of Beasts is large, but there is a considerable deficiency in weight. In consequence the best qualities are making rather more money; still, on the average, trade is dull. The supply of Sheep is neither so good nor so large as of late: the prices are better, more especially for Long-wools. There is more inquiry for good Lambs, which, being scarce, are dearer. We have an abundant supply of Calves; they are lower than we have known for a very long period. From Holland and Germany there are 810 Beasts, 2930 Sheep, 372 Calves, and 70 Pigs; from Scotland, 200 Beasts; from Norfolk and Suffolk, 1000; and 1000 from the midland counties.

Per st. of 8 lbs.—s	d	s	d	Per st. of 8 lbs.—s	d	s	d
Best Scots, Here-				Best Long-wools	to	...	
fords, &c. ... 3	4 to 3	8		Ditto Shorn ... 3	6 — 3	8

Ditto Shorn ... 3	10 — 4	0		Pigs 3	0 — 4	0	

Beasts, 3719; Sheep and Lambs, 28,350; Calves, 584; Pigs, 253.

FRIDAY, July 26.

The number of Beasts is not large, and the weather being cool trade is brisk; however, except in a few cases, we cannot quote higher rates than on Monday. The supply of Sheep and Lambs is considerably shorter; our prices for the former have advanced fully 2d. per 8 lbs.; and there is also a better demand for the latter, at a little more money. Calves again are plentiful, but the weather being favourable, they are disposed of pretty freely, at an advance of 4d. per 8 lbs. From Germany and Holland there are 263 Beasts, 740 Sheep, 284 Calves, and 30 Pigs; from Scotland, 100 Beasts; 250 from the North and Midland, and 94 Milch Cows from the home counties.

Best Scots, Here-				Best Long-wools	to	...	
fords, &c. ... 3	6 to 3	8		Ditto Shorn ... 3	6 — 3	10

Half-breds	—	...		Calves 2	4 — 3	4	
Ditto Shorn ... 4	0 — 4	2		Pigs 3	0 — 4	0	

Beasts, 934; Sheep and Lambs, 11,420; Calves, 666; Pigs, 265.

HOPS.—FRIDAY, July 26.

Messrs. PATTENDEN and SMITH report that the market continues firm for all new and fine coloured yearlings, with an unusually short supply. The reports from the plantations have up to this time continued to come favourable, with the exception of some complaints of mould, which, with a continuance of wet, is thought may do serious damage, the Hops being still in a very backward state. The duty is considered to be fairly estimated at about 180,000*l.*

HAY.—Per Load of 36 Trusses.

SMITHFIELD, July 25.

COAL MARKET.—FRIDAY, July 26.

Carr's Hartley, 14s.; Wallsend Haswell, 16s. 3d.; Wallsend Hetton, 16s, 3d. Wallsend Tees, 16s. 3d.—Ships at market, 85.

COVENT GARDEN, July 27.

Vegetables are abundantly supplied; Hothouse Grapes and Pine-apples plentiful. The supply of Peaches and Nectarines is well kept up. Ripe Gooseberries fetch from 2s. 6d to 3s. 6d. per half sieve. Oranges and Lemons though scarcer are sufficient for the demand. Carrots and Turnips may be had at from 3d. to 6d. per bunch. Potatoes fetch from 1d. to 2d. per lb. Lettuces and other salading are sufficient for the demand, and so are Mushrooms. French Beans are plentiful. Cut Flowers consist of Heaths, Pelargoniums, Cinerarias, Lily of the Valley, Pinks, Carnations, Rhododendrons, Ranunculuses, and Roses.

FRUITS.

Pine-apples, per lb., 4s to 6s	Lemons, per doz., 1s to 3s

ENGLISH TIMBER AND BARK.—JULY 27.

	Round Timber. Per Load.	Plank. Per Foot Cube.	Inch Board. Per Foot Superf.
Oak.....	£5 0 0 to £7 0 0	3*s.* 0*d.* to 5*s.* 0*d.*	0*s.* 4½*d.* to 0*s.* 6*d.*
Ash	4 10 0 — 6 10 0	2 6 — 4 0	0 3 — 0 4
Elm	2 10 0 — 3 10 0	1 6 — 2 0	0 2 — 0 3½
Beech ...	2 5 0 — 3 0 0	1 6 — 2 0	0 2 — 0 2½
Lime ...	3 5 0 — 4 5 0	2 0 — 2 6	0 3½ — 0 4½

Bark appears in larger supply than was generally anticipated, and some large parcels are now in the market. There seems a general disinclination on the part of tanners to buy largely at present prices, which is from 13*l.* to 15*l.* per load of 45 cwt.

MARK LANE.

MONDAY, JULY 22.—The supply of Wheat by land carriage samples from Essex this morning was larger than of late, but less from Kent; the improvement of Friday was not maintained, and the bulk was disposed of on about the same terms as this day se'nnight; some samples remained unsold towards the close. Business in foreign was exceedingly limited, at our quotations.—Secondary qualities of Barley are 1*s.* per qr. lower; in others we observe no alteration.—Beans and Peas remain as last week.—Oats are a dull sale at a decline of 1*s.* per qr.—The accounts received to-day from Ireland respecting the Potatoes speak very badly of the crop.

FRIDAY, JULY 26.—The arrivals of grain, both English and foreign, this week, have been moderate. Part of the English Wheat left over from Monday remains unsold, but foreign is very firmly held, and in a few instances slightly enhanced rates have been obtained.—In Barley, Beans, and Peas, no alteration has occurred.—The Oat trade remains the same as on Monday.—Indian Corn afloat is held at 28*s.*, cost, freight, and incurance.—There is more inclination to purchase Flour at old prices, but holders ask rather more money.

ARRIVALS THIS WEEK.

LIVERPOOL, FRIDAY, JULY 19.—Exclusive of a further supply of Wheat from the North, Odessa, and Egypt, and 600 sacks of French Flour, the arrivals into this port since Monday last have been insignificant. All good descriptions of British and foreign Wheats experienced a limited demand to-day from home and country millers, and the best qualities of both red and white nearly maintained late prices. States and Canadian Flour, including French and Irish, met a fair inquiry. Barley and Malt dull of sale; Beans stationary; Peas rather dearer. Oats in slow request on the terms last noted. Oatmeal a shade lower in value. Indian Corn was somewhat depressed in value, but improved subsequently.——TUESDAY, JULY 23.—The imports of British grain and flour are still small, but from abroad we have had considerable arrivals since Tuesday last. The trade here during the week has been dull. We had a fair attendance of town and country millers this morning, and Wheat declined 1d. per bushel and 6d. per sack. Oats are ½d. per bushel dearer. Grinding Barley was 1d. to 2d. per bushel, and Beans, Peas, and Indian Corn each fully 6d. per qr. higher. The present prices are: Wheat, English, red, per 70lbs., 5*s.* 10d. to 6*s.* 4d.; white, 6*s.* 1d. to 6*s.* 7d. Barley, Scotch and Irish, per 60 lbs., 2*s.* 9d. to 3*s.* Malt, English, per qr., pale, 48*s.* to 52*s.* Oats, English and Scotch, per 45 lbs., 2*s.* 8d. to 2*s.* 10d. Beans, English, per qr., 27*s.* to 31*s.* Peas, do. do., 26*s.* to 29*s.*

NOW READY,

MEDICAL AND ŒCONOMICAL BOTANY.

BY JOHN LINDLEY, PH.D., F.R.S.

In One Volume, 8vo, Illustrated with some Hundreds of Woodcuts, price Fourteen Shillings, cloth.

EXTRACTS FROM THE AUTHOR'S PREFACE.

"The Vegetable Kingdom contains, among a large quantity of plants of no known importance to man, various useful species employed in medicine, the arts, or in the many branches of domestic œconomy. The principal part of those which can be brought by teachers in Europe under the notice of students, or which, from their great importance, deserve to be among the earliest subjects of study, are mentioned in the following pages, where they arranged in the manner proposed in the 'VEGETABLE KINGDOM' of the author, with the sequence of matter departed from in a few instances, when it was believed that the convenience of younger students would be consulted by doing so. The author trusts that this selection will be found to have been made in such a way that all teachers who possess reasonably extensive means of illustrating their lectures, and all Botanic Gardens, may furnish the larger part of the species which are mentioned. A small selection was indispensable; firstly, because a greater work would have been beyond the reach of the majority of purchasers; and secondly, because experience shows us that those who have to study a science of observation, such as Botany, require to concentrate their attention, in the first instance, upon a limited number of objects."

"The plan of the work is similar to that so happily employed by Linnæus in his Materia Medica, a book invaluable in its day, although now forgotten, and better adapted to the objects of medical men than any thing which has since appeared. Each species, placed in its due position in the classification, has its vulgar or officinal name, as well as that which it bears in science, and, in a few words, the country whence it comes, the quality it has been said to possess, and the uses to which it has been found applicable. Very short phrases are also given, for the purpose of showing how the genera or species are to be distinguished from each other.

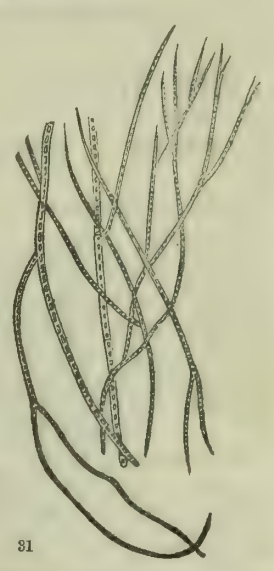
"The whole plan of the work is, in fact, to point out *distinctions*: and the fewest possible words are employed with this view. In many instances the distinctions may not be absolute, but they are sufficient for ordinary purposes. Those who wish to become better acquainted with Botany will, of course, make the 'VEGETABLE KINGDOM' of the author the subject of ulterior study. For the convenience of those who may desire to do so, references are made to that work throughout all the following pages."

SPECIMEN OF THE ILLUSTRATIONS.

PENICILLIUM. *Link.* Microscopic. Cobweb-like or mothery flocculent masses, producing simple globose *spores* disposed in patches about the pencil-shaped ends of septate fertile threads.

1. P. *glaucum* Greville.—(THE VINEGAR PLANT.)

Mycelium forming a close tough crust-like or leathery web; branches somewhat entangled and bifid; spores verdigris-green.



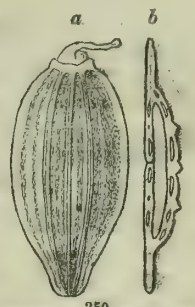
Habitat. On decaying bodies, and in fluids in a state of acetification.

Quality. Assists in the decomposition of decaying matter, and augments rapidly the acetous fermentation of saccharine fluids. A bit placed in sugar and water soon changes it to vinegar.

MYCODERMA. It is probable that the flocculent substance which forms in various infusions when they become "mothery," and which bears this name, is only the mycelium of Mucor, Penicillium, and other Fungals of a similar nature. The accompanying cuts, from a paper of Mr. Berkeley's, illustrate this. Fig. 29 is a view of the mycelium of Mucor subtilissimus as found in water, with one ball of the reproductive bodies formed when the mycelium reached the air; 30 is Penicillium candidum in the same state, the greater part of which had been formed in water; but a couple of branches reaching the air produced the true fructification of this genus of Fungals.

Their identity with some of the Mycoderms, figured by Dr. Pereira in the Pharmaceutical Journal, is sufficiently evident; as will be seen by a cut (fig. 31) of the "Vegetation in empyreumatic succinate of ammonia," borrowed from the *Pharm. Journal*, vol. vii. f. 8, p. 341.

NARTHEX. *Falconer. Umbels* compound. *Involucres* 0. *Calyx* obsolete. *Fruit* thin, compressed at the back, with a dilated border. *Ridges* 3 only, dorsal. *Vittæ* 1 to each dorsal furrow, and 2 to the laterals. *Albumen* thin, flat.



1. N. *Asafœtida* Falconer. *Ferula Asafœtida* Linnæus.—(ASAFŒTIDA.) Fig. 350.

Radical leaves 3-parted; segments bipinnatifid, with oblong-lanceolate, obtuse, decurrent lobes.

Habitat. Laristan, Affghanistan, the Punjaub. *Quality.* Gum-resin fetid, stimulating, antispasmodic.

Uses. In spasms and convulsions, chronic catarrh, flatulent colic, uterine obstructions.

N. B. This is the genuine Asafœtida plant, but probably the substance is also yielded by even species of Ferula. It has been conjectured to have produced the Silphium or Laser of the ancients, but on unsatisfactory evidence. See Thapsia, p. 256.

350.

LONDON: PUBLISHED FOR THE AUTHOR, BY

BRADBURY AND EVANS, 11, BOUVERIE STREET.

LIGHT, CHEAP, AND DURABLE ROOFING.

CROGGON'S PATENT ASPHALTE ROOFING FELT is perfectly impervious to rain, snow, and frost, and has been tested by a long and extensive experience in all climates. Saves half the timber required for slates; can be laid on with great facility by farm servants, or unpractised persons. Price 1*d.* per square foot.

CROGGON'S PATENT NON-CONDUCTING FELT, for Steam Boilers and Pipes, saves 25 per cent. of fuel.

Samples and Testimonials sent by post, on application to CROGGON and Co., 2, Dowgate-hill, London.

THE TEETH.—How often do we find the human face divine disfigured by neglecting the chiefest of its ornaments, and the breath made disagreeable to companions by non-attention to the Teeth! Though perfect in their structure and composition, to keep them in a pure and healthy state requires some little trouble; and if those who are blessed with well-formed Teeth knew how soon decay steals into the mouth, making unsightly what otherwise are delightful to admire, and designated unhealthiness by the impurity of the breath, they would spare no expense to chase away these fatal blemishes. But although most ladies are careful, and even particular in these delicate matters, yet few are sufficiently aware of the imperative necessity of avoiding all noxious or mineral substances of an acrid nature, and of which the greater part of the cheap Tooth Powders of the present day are composed. It is highly satisfactory to point out Messrs. Rowlands' Odonto, or Pearl Dentrifice, as a preparation free from all injurious elements, and eminently calculated to embellish and preserve the dental structure, to impart a grateful fragrance to the breath, and to embellish and perpetuate the graces of the mouth.—*Ladies' Gazette of Fashion.*

ROWLAND'S ODONTO

Is a white powder compounded of the choicest and most *recherché* ingredients of the oriental herbal, of inestimable value in preserving and beautifying the Teeth, strengthening the Gums, and in rendering the breath sweet and pure. Price 2*s.* 9*d.* per box.—Sold by A. ROWLAND and SONS, 20, Hatton-garden, London, and by Chemists and Perfumers.

EMIGRATION TO AUSTRALIA.—New Line of Packets from Liverpool:

PETREL, 1200 tons, to sail on the 10th of October.
CONDOR, 1500 „ „ 10th of December.

A 1, new Ships, coppered and copper-fastened.—For Freight or Passage apply to the owners, GIBBS, BRIGHT, and Co., 1, North John-street, Liverpool.

NEWS, NEWS, NEWS.—The best, cheapest, and largest Newspaper in the World.—LLOYD'S WEEKLY LONDON NEWSPAPER contains 60 large columns of the latest intelligence from all parts of the Globe; price only Threepence, postage free. Send Three Postage Stamps to E. LLOYD, 12, Salisbury-square, London, and receive one copy as a sample.

THE SUMMER RIDE OR PROMENADE.—The peculiar virtues of C. and A. OLDRIDGE'S BALM OF COLUMBIA completely remove the difficulty experienced by Ladies in preserving their ringlets after exercise; its use so invigorates the hair, that tresses, previously the straightest and most destitute of curl, rapidly acquire a vigour which maintains in permanent ringlets the head-dress of the most persevering votary of the ball-room, the ride, or the promenade. After the Minerals and Vegetables of the Old World have been compounded in all imaginable ways in fruitless attempts to discover so important a desideratum, we are indebted to the Western Hemisphere for furnishing the basis of

OLDRIDGE'S BALM OF COLUMBIA,

the efficacy of which in preserving, strengthening, and renewing the hair has become a matter of notoriety among all civilised nations. Its restorative virtues are indeed a proverb, and the most satisfactory attestations to its infallibility in reproducing hair upon persons otherwise hopelessly bald, have been published from time to time by the Proprietors, 13, Wellington-street North, Strand, a few doors above the Lyceum Theatre on the opposite side.

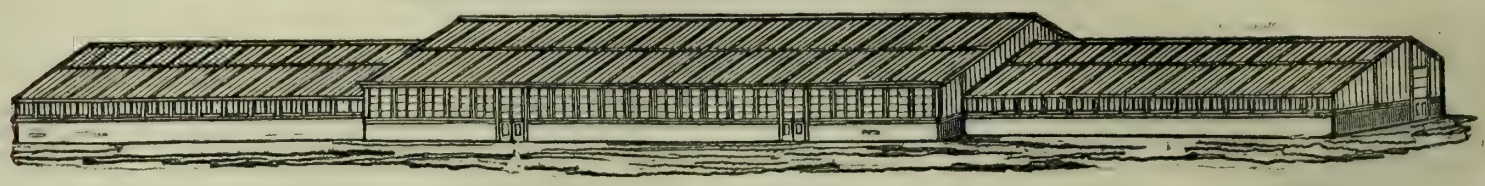
3*s.* 6*d.*, 6*s.*, and 11*s.* per Bottle; no other prices are genuine. When you ask for "Oldridge's Balm," never let the shopkeepers persuade you to buy any other article as a substitute.

On the 31st will be published, price 2*s.* 6*d.*, No. VI. of

PAXTON'S FLOWER GARDEN.

Edited by DR. LINDLEY and JOSEPH PAXTON,
And Illustrated by highly finished Plates and Woodcuts.
London: BRADBURY and EVANS, 11, Bouverie-street.

METCALFE'S ALKALINE TOOTH-POWDER will be found to be the best that has yet been produced; it contains no acids, nor anything that can injure the finest enamel; it thoroughly removes the tartar and all impurities, produces that beautiful white appearance so much to be desired, and its fragrant perfume tends to sweeten and purify the breath. M. and Co., from the many years they have been celebrated as Tooth-Brush Makers, have had opportunities (that occur to few) of testing the relative merits of those powders that have been brought before the public. They have now succeeded in procuring the receipt from which the above Powder is prepared, and confidently recommend its universal adoption. Wholesale and retail at METCALFE, BINGLEY, and Co.'s, Brush-Makers to H.R.H. Prince Albert, 2*s.* per box. Caution.—The genuine Powder will have the Royal Arms, combined with those of H.R.H. Prince Albert, on the lid of the box, and the signature and address of the firm, thus: "METCALFE, BINGLEY, and Co., 130 B, Oxford-street, London."



A CLEAR COMPLEXION.

GODFREY'S EXTRACT OF ELDER FLOWERS is strongly recommended for Softening, Improving, Beautifying, and Preserving the SKIN, and in giving it a blooming and charming appearance, being at once a most fragrant perfume and delightful cosmetic. It will completely remove Tan, Sun-burn, Redness, &c., and by its balsamic and healing qualities, render the skin soft, pliable, and free from dryness, scurf, &c., clear it from every humour, pimple, or eruption; and, by continuing its use only a short time, the skin will become and continue soft and smooth, and the complexion perfectly clear and beautiful. Sold in bottles, price 2*s.* 9*d.*, with directions for using it, by all Medicine Vendors and Perfumers.

GRAY, ORMSON, AND BROWN,

DANVERS STREET, CHELSEA,

Respectfully solicit the attention of the Nobility and Gentry to their superior manner of Erecting and Heating every description of Building connected with Horticulture. They have much pleasure in giving the following testimonial referring to the range of houses shown below.

Peach House, 30 by 16 feet. | Vinery, 30 by 16 feet. | Stove, 45 by 20 ft. | Greenhouse, 45 by 20 ft. | Vinery, 30 by 16 ft. | Vinery, 30 by 16 ft.

[ERECTED FOR JOHN SHAW LEIGH, ESQ., LUTON HOO.]

Extract of a Letter from Mr. FRASER.—"I have much pleasure in expressing my entire satisfaction with the range of houses you erected here. I may also state that my honoured employer, JOHN SHAW LEIGH, Esq., is perfectly satisfied. I have no hesitation in stating, that to the best of my knowledge, there is not a more complete range of glass in the country, as regards both building and heating. I may add that they are admired by every Gardener who has seen them. I shall have much pleasure in answering any references you may please to direct.

(Signed.) "JAMES FRASER, Gardener, Luton Hoo Park."

BRENTFORD.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, MARKET-GARDENERS, AND PUBLIC COMPANIES, ENGAGED IN PLANTING.

MESSRS. PROTHEROE AND MORRIS are favoured with instructions to submit to an unreserved Sale, by Auction, on the premises, Brentford Nursery, Middlesex, about the second week in October (by order of the executors of the late Mr. J. Ronalds), the whole of the valuable NURSERY STOCK, riding over about 30 acres, consisting of a large and rich assortment of Standard and Dwarf Maiden, Trained and Untrained Fruit trees, of every description; Ornamental trees, Deciduous and American Shrubs; fine Evergreens, &c. Further particulars in future advertisements.

American Nursery, Leytonstone, July, 1850.

HARDY AND OTHER CONIFERÆ.

MR. J. C. STEVENS will sell by Auction, at his Great Room, 38, King-street, Covent-garden, on MONDAY, 5th August, at 12 for 1 o'clock, a fine collection of CONIFERS, in pots, comprising many rare and beautiful species, such as Abies gigantea, Picea grandis, Pinus Wincheseriana, Taxus japonicus, Juniperus thuriferæ, &c.; also some extraordinarily fine plants of Araucaria imbricata, 3 feet high, the rare Araucaria glauca, Cunninghamii, excelsa, &c. —May be viewed on Saturday, morning of sale, and Catalogues had.

THE FINEST COLLECTION OF SPECIMEN AND OTHER HEATHS THAT HAS EVER BEEN OFFERED TO PUBLIC SALE.

MR. J. C. STEVENS is favoured with instructions from SIGISMUND RUCKER, jun., Esq., who is giving up Heath growing, to submit to unreserved sale by Auction, at his Great Room, 38, King-street, Covent-garden, on FRIDAY, the 9th of August, at 12 for 1 o'clock, the whole of his magnificent Collection of ERICAS, consisting of about 200 Plants, about 100 of which are Exhibition Specimens, and many of them unrivalled both as to form and size. This collection, which is generally admitted to be the finest in the kingdom, will be found to combine all the most rare species, with the popular and well known sorts.—May be viewed on the day prior and morning of sale, and Catalogues had of Mr. J. C. STEVENS, 38, King-street, Covent-garden, London.

SURREY.—EXCELLENT FARM, WITH SHOOTING, TO BE LET, FROM MICHAELMAS NEXT.

MR. HURLEY, AUCTIONEER, LAND and FARM AGENT, is favoured with the letting of a singularly eligible TITHE FREE FARM ESTATE, situate in the most beautiful part of the above county, within 16 miles of London, consisting of nearly 400 Acres of rich old Meadow, Pasture, and Arable Land, all well fenced, and in excellent condition, together with a spacious Residence, adapted for a genteel family, with commodious Stabling, double Coach-house, Granary, and all other requisite Out-buildings, and two Kitchen Gardens. Adjoining is a Farm-yard, Stables, Stalls for Oxen, &c., and at a quarter of a mile distant is a good Farm-house, with Garden, Farmyard, and Buildings. Also, Two Cottages with Gardens. The Shooting is most excellent, and with the Residence is let for 100*l.* a year, and would be continued if agreeable. The whole, forming an Estate suitable for a gentleman of moderate means, a professional man, or a gentleman farmer, rarely to be met with. There is also a pew in the parish church. Rent 300*l.* per annum, tithe free, rates and taxes exceedingly moderate.—For further particulars apply at MR. HURLEY'S offices, 62, Nelson-square, London; or to Mr. G. SMITH, Surveyor, 14, Finch-lane, City.—July 27.

FARMS WEST OF LONDON.

MR. HURLEY, FARM, ESTATE, and GENERAL COMMISSION AGENT, is favoured by an extensive landed proprietor, to Let and Dispose of several really excellent Meadow and Arable Farms, near London, and a Principal Corn Market, from 50 to 500 acres, with good houses and homesteads. Rentals from 60*l.* to 700*l.* per annum.—For particulars, apply at the Auctioneer's Offices, 62, Nelson-square, Blackfriars-road, London.

ELIGIBLE SMALL ESTATE, TO BE SOLD IN BUCKS.

MR. HURLEY, AUCTIONEER and LAND AGENT, is empowered to sell privately a most desirable SMALL FARM ESTATE, within 18 miles of Town and 3 of a Station (Great-Western Railway), possessing an excellent Residence, Farm Buildings, &c., all in good repair; together with a large Garden, and 33 acres of rich Meadow, 7 acres only Arable, in a ring fence, and delightfully situated, near a late Nobleman's park. — For terms apply at the Offices, 62, Nelson-square, London.

FARMS TO LET—RENTS TO MEET THE TIMES.

MESSRS. REID, MORGAN, AND CO., beg to inform agriculturists and others that their Michaelmas list of about 100 FARMS, of various sizes, in all parts of the country, is now open for inspection at the Agricultural Agency Offices, 38, Moorgate-street, London; or will be forwarded free of charge upon receipt of six postage stamps.

N.B. State the size of farm required, and in what locality preferred.

FARM ON THE LINCOLNSHIRE WOLDS.

TO BE LET, and entered upon at Lady-day next, at South Thoresby, near Alford, a good FARM HOUSE, and Offices, with Three Hundred Acres of Land in capital condition; for the last 18 years in the occupation of Mr. Matthew Hickson, deceased. Also 14 acres adjoining, which, if desired, might be broken up. Lime of superior quality can be had from an extensive kiln on the spot. The Tenant will have an exclusive right to the Game; Railroad direct to London; and the Humber and Railroad Station about one mile distant.—For particulars, and to view this desirable farm, apply to THOMAS KEAL, Thoresby.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn-place, in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 7, Church-row, Stoke Newington, both in the County of Middlesex, Printers, at their office in Lombard-street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles-street, in the parish of St. Paul's, Covent-garden, in the said county, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, JULY 27, 1850.

PINE-APPLE PLANTS FOR SALE.—To be disposed of, in one or more lots, about 250 healthy PINE PLANTS, of the Providence, Montserrat, and Queen kinds.—For price, and other particulars, apply to Mr. E. SMITHSON, Gardener, Newland Park, near Wakefield, Yorkshire.

HOYLE'S SEEDLING PELARGONIUMS FOR 1850.

CHARLES TURNER will send out, early in the Autumn, strong established plants of the following distinct varieties raised by G. W. Hoyle, Esq. Ajax gained the 4*l.* and Ocellatum the 3*l.* prizes at the Great Seedling Pelargonium Show, Surrey Gardens, in June last, being two of the four prizes awarded on that occasion. Early orders will ensure first selection.

AJAX.—A noble dark variety, smooth, and of fine substance, lower petals rosy purple, top petals very dark purple, with even narrow margin of vivid crimson; very free bloomer; has been justly styled "The leading flower of the season." Price 1*l.* 11*s.* 6*d.*

OCELLATUM.—A great novelty, lower petals bright pink, with a distinct and constant spot of deep crimson; top petals deep crimson spot, shaded off with bright rose, white eye, free bloomer, and good grower. Price 1*l.* 11*s.* 6*d.*

MAY QUEEN.—A large, distinct, and pleasing variety. Orange-rose top petals, crimson blotch, shaded off with orange, the five petals have a delicate margin of pale pink; lower petals vivid rose; large well-defined white eye, very free bloomer, will be a great favourite on the home stage. Price 1*l.* 11*s.* 6*d.*

NECTAR CUP.—Rose, top petals rich orange-rose, with narrow pink margin, clear white eye, fine substance, good habit. Price 1*l.* 1*s.*

FLAVIA.—Orange-scarlet, the brightest in this class that has been offered, and makes a fine display on the stage, rather crumpled on the edge, and lower petals too long. Price 1*l.* 1*s.*

GENERALISSIMO.—Large and very attractive; lower petals salmon, with spots of a deeper colour, white centre; top petals very dark, rich, and velvety, shaded with lively orange, occasionally crumpled on the edge. Price 1*l.* 1*s.*

RUBIOLA.—Fine crimson scarlet of beautiful texture, dark spot on the top petals, rather deficient in breadth of petals. Price 1*l.* 1*s.*

CORINNE.—Light purple, very smooth and free bloomer, dark top petals. Price 15*s.*

ISIS.—A neat smooth flower, of good quality, very free bloomer, rose with white eye, and dark blotch on top petals. Price 15*s.*

CARDINAL.—Fine rich orange crimson, black blotch on top petals, very smooth, not a strong grower. Price 15*s.*

HEARTSEASE.—Scarlet rose, large fine shape and substance; but being inconstant, purchasers of the above will have a plant without charge.

Price 8*l.* 10*s.* for the set.

Royal Nursery, Slough.

GRAPE VINES IN POTS FOR FORCING.

J. WEEKS AND CO., King's-road, Chelsea, beg to call attention to their splendid collection of Grape Vines, all struck from eyes, now two and three years old, the finest Plants that have ever been offered for Sale, consisting of 60 varieties, all of the best sorts, warranted true.

THE HAMBURGHS AND MUSCADINES being the best for early forcing in pots, this is the best time for Gardeners to have them, so as to get the eyes ripe and prominent. This Nursery is well worthy of a visit, as all modern Horticultural improvements are in full operation.

J. WEEKS and Co., King's-road, Chelsea.

NEW AGRICULTURAL SEEDS.

SUTTON'S EARLY SIX WEEKS TURNIP. A field of these Turnips, grown from Messrs. SUTTON'S Seed by Mr. E. W. MOORE, Steward to Earl RADNOR, on poor soil at Coleshill, gained Mr. PUSEY'S 20*l.* prize, at the Farringdon Agricultural Show, in December, 1849. Price of Seed, 10*d.* per pound, or 5*s.* per gallon.

TRUE ITALIAN RYE GRASS.—This should be sown at the end of August, or first week in September.

J. SUTTON *and* SONS *have just harvested a true stock of* Mr. DICKENSON'S *fine variety, very productive, and highly nutritive.* Price per bushel, 7*s.* 6*d.*

PERENNIAL GRASS SEEDS for Permanent Pasture, Irrigated Catch Meadows, &c., of the sorts best suited to the soil, at very moderate prices. New Seeds of Trifolium incarnatum, Dwarf Rape, Winter Vetches, Winter Barley, &c., will be ready in a few days.

Address, JOHN SUTTON and SONS, Seed-growers, Reading, Berks.

N.B. All Goods, not less than 1l. value, are delivered, free of carriage, to any station of the Great Western, South-Western, or South-Eastern Railways, or to any office in London.

TO THE ADMIRERS OF THAT SPLENDID AUTUMNAL FLOWER, THE CHRYSANTHEMUM.

YOUELL AND CO. are now prepared to execute orders from their extensive and very select collection of the above, comprising all the new and fine continental varieties, at the following prices:

50 best new sorts ..... 25*s.*
25 ditto ..... 15*s.*
12 ditto ..... 9*s.*

Well established in small pots, or by post free.

NEW DWARF CHINESE OR LILLIPUTIENNE CHRYSANTHEMUMS.

This new and beautiful class are well deserving the attention of cultivators from their exceeding dwarf habit (not attaining more than 1 foot in height). The profusion of flowers with which they are covered, as well as the great variety and distinctness of colour, will render them general favourites. Strong plants for autumn blooming are now ready for sending out at the following prices:

9 fine varieties sent out last year (for the first time) for 9*s.* 0*d.*
13 do. raised by M. Lebois (and sent out for the first time this season), for 30 0

One sent over to the Trade when two are ordered.

The latter are figured in the last December Number of the "Annales de la Societé d'Agriculture et de Botanique de Gand," and are perfect gems, engravings of which may be seen at YOUELL and Co.'s Nursery.

Descriptive Catalogues of the above may be had on application. Printed directions of their successful and easy method of cultivating the Chrysanthemums for exhibition, &c., will be forwarded with all orders.

ANEMONE SEED,

Saved from selected sorts, is now being harvested by YOUELL and Co. in the finest condition, and can be forwarded, per post free, at 2*s.* 6*d.* and 5*s.* per packet, sufficient to sow a bed of 12 and 24 yards. If sown at the present time it will afford a fine display through the autumn and winter months.

Royal Nursery, Great Yarmouth.

PINE PLANTS FOR SALE.—A Gentleman in the Midland Counties, being about to alter his Pineries into Conservatories, is desirous of parting with the plants. They consist of about 50 Fruiting and 70 to 80 Succession Plants, all very clean, good sorts, and in fine growing condition. Price, for the whole, 5*l.* This Advertisement will not be repeated.—Direct to Y. Z., Office of this Paper.

NORLAND NURSERY, NOTTING HILL.

W. TOWNSEND, having a very large Stock of the following PLANTS, is enabled to offer them as under:

Dielytra spectabile, a first-rate hardy herbaceous plant, from the north of China, 1*l.* per doz., 7*l.* 10*s.* per 100. A considerable reduction when a large quantity is taken.
Fuchsia spectabile at the same price.
N.B. The above are strong bushy plants.
Tropæolum Dickeryanum, 5*s.* each, 2*l.* 10*s.* per dozen.
,, Smithii, 1*s.* 6*d.* each, 15*s.* per dozen.
Cantua pyrifolia, 2*s.* each, 20*s.* per dozen.
Heliotropium corymbosum (best of all), 1*s.* 6*d.* each, 12*s.* p. doz.
Centradenia floribunda, 1*s.* 6*d.* each.
All the new continental and other Verbenas. Antirrhinums, Petunias, &c., are now in bloom, and can be had at very reduced prices. Catalogues on application.

NEW CHRYSANTHEMUMS.—12 best new varieties of last season, fine plants, well established in 5-inch pots, for flowering this autumn, 15*s.*

60	very fine varieties, including the above	...	...	£2 0 0
40	ditto	ditto	ditto	... ... 1 10 0
25	ditto	ditto	12 superb varieties	... 0 9 0

All well established in 48-size pots.

Catalogues sent pre-paid on receipt of four postage stamps. Goods delivered free to London.

BASS and BROWN, Seed and Horticultural Establishment, Sudbury, Suffolk.

SPLENDID NEW FUCHSIA—"NICHOLS' PRINCE ARTHUR."

GEORGE NICHOLS begs to inform the Public and Trade that he has been fortunate in raising one of the largest and best White Fuchsias ever offered to the public; it has been declared by well-qualified judges to be beyond comparison the finest ever yet raised: its foliage, habit of growth, and freeness of bloom makes it a very desirable variety; the size of each individual flower is very great, being upwards of 3½ to 4 inches from one sepal to the tip of the opposite one.—Pure white tube, with waxy appearance and sepals well proportioned, very stout, reflexing upwards very much—Corolla of full size and fine form, deep rosy crimson, and having all these qualities over every other variety as to merit the honourable name which has been assigned to it.—Plants in the autumn, post free, or in pots, at 10*s.* 6*d.* each.

VERBENA VISCATA.—The following high opinion is given in the "Florist and Garden Miscellany," Sept. 1849.—G. N. L. "A very fine variety; large-sized truss, and the individual Flowers large; deep rich crimson maroon; improvement on Lord Thurlow—it must rank among the best and most distinct varieties in cultivation."—This splendid Verbena may be had with the Fuchsia, or separate, at 7*s.* 6*d.* each, post free.

Hunslet near Leeds, August 3.

MESSRS. J. AND H. BROWN can send these select Plants to any part of the United Kingdom or the Continent.

HEAL and SON, Bedding Manufacturers, 196, opposite the Chapel, Tottenham-court-road, London.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, especially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the Nobility, Gentry, and Clergy, for out-door work at their country seats, The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.

Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to WALTER CARSON, No. 9, Great Winchester-street, Old Broad-street, Royal Exchange.

No Agents.—All orders are particularly requested to be sent direct.

Messrs. EVANS and BROWN beg to state that they will have a fine first-class ship on the berth for NEW ORLEANS for the 1st of September. For a select and cheap passage parties should send in their names and ages, without deposit money, as early as possible.—Address, 119, Waterloo-road, Liverpool Also:—

TO EMIGRANTS BOUND FOR QUEBEC.

Messrs. EVANS and BROWN also beg to state, that they will have a fast-sailing, first-class ship on the berth for QUEBEC, on the 14th of August. Parties desiring a cheap and select passage, should forward their names and ages, without deposits, as early as possible. Address as above.

EMIGRATION TO AUSTRALIA.—New Line of Packets from Liverpool:

PETREL, 1200 tons, to sail on the 10th of October.
CONDOR, 1500 „ „ 10th of December.

A 1, new Ships, coppered and copper-fastened.—For Freight or Passage apply to the owners, GIBBS, BRIGHT, and Co., 1, North John-street, Liverpool.

ASHBY'S INDIA EXPORT PALE ALE.— London Stores, under the South-Western Railway Terminus, Waterloo-road. India Pale Ale, 21*s.*, 18 gallons; 10*s.* 6*d.*, 9 gallons; Family Ale, 16*s.*, 18 gallons.—CHAS. ASHBY and Co. invite the particular attention of private Families and Clubs to their PALE ALE, as brewed by them for the COLONIAL MARKETS for the past 20 years. Supplied in small casks direct from the Brewery, Staines, and the London Stores, or from their agents—Messrs. W. Hancock, 80, Connaught-terrace, Hyde-park; Chidell and Stewart, 40, Lime-street, City; W. H. Chaplin, 11, Sebbon's-buildings, Upper-street, Islington; J. Shenton, Greenwich; W. Ferguson, Reading; Thos. Berry, Brighton and Lewes; A. J. Richardson and Co., Portsea and Southsea; J. Skidmore, Rickmansworth; Cooksey, Brothers, Southampton.

TOOTHACHE PERMANENTLY CURED by using BRANDE'S ENAMEL for filling decaying Teeth, and rendering them sound and painless. Price 1*s.* Enough for several Teeth. The only substance approved by the medical faculty, as being unattended with pain or danger, and the good effects of which are permanent.

Sold by all Chemists in the United Kingdom. Twenty really authorised Testimonials accompany each box, with full directions for use. Sent free, by return for post, by J. WILLIS, 24, EAST TEMPLE CHAMBERS, WHITEFRIARS, FLEET-STREET, LONDON, in return for 13 penny stamps.

CAUTION.—The great success of this preparation has induced numerous unskilful persons to produce spurious imitations, and to Copy BRANDE'S ENAMEL Advertisements. It is needful, therefore, to guard against such impositions, by seeing that the name of JOHN WILLIS accompanies each packet.

MESSRS. STANDISH AND NOBLE'S new descriptive CATALOGUE OF SELECT HARDY ORNAMENTAL PLANTS is just published, and may be had for four postage stamps. Besides a Treatise on the cultivation of American Plants, it contains a Plate and Description of the Funebral Cypress, Notices of Cephalotaxis Fortunii, Cryptomeria japonica, Quercus sclerophylla and inversa, Viburnum plicatum and macrocephalum, with many recent introductions from the north of China, quite new to English gardens.

Messrs. S. and N. take this opportunity of stating that they give Designs for Laying out New Grounds and Plans for Improvements; also Estimates for all kinds of Planting, whether ornamental or economic.—Bagshot Nurseries, Aug. 3.

NEW LATE STRAWBERRY, WILMOT'S "PRINCE ARTHUR."

J. WILMOT, in offering this new variety of STRAWBERRY to the Public, is confident that it combines qualities which no other kind at present in cultivation does possess, being of delicious flavour, and coming in after the principal Strawberry season is over. It possesses the property of firmness of texture, so that it may be transmitted to any part of the kingdom without sustaining injury, as it may be kept for several days after being gathered, when fully ripe, without any indication of decay or loss of flavour.

"Prince Arthur" is one of the largest sized Strawberries, and a most abundant bearer; the foliage is small, and never exceeds 6 inches in height; the fruit is consequently fully exposed to the sun. Its dwarf habit requires it to be planted not more than a foot apart. The fruit is perfectly formed, of a rich scarlet, and colouring equally all over the berry. If planted at the distance recommended it will produce double the weight per acre of any other variety.

Strong plants will be ready for sale in September next, at 5*l.* per 100, on prepaid application only, to JOHN WILMOT, Isleworth, Middlesex; Robert Glendinning, Chiswick Nursery; William T. Atwood, Mortlake, Surrey; George Charlwood, Seedsman, Covent-garden; and Messrs. Hurst and M'Mullen, 6, Leadenhall-street, London.—Isleworth, Middlesex, Aug. 3.

TO THE LOVERS OF FERNS.

WILLIAM MASTERS, Exotic Nursery, Canterbury, has to offer a fine Collection of well-grown Plants of this interesting family, at 42*s.* per dozen, where the selection is left to himself.—Canterbury, Aug. 3.

SEEDLING PELARGONIUM—"PRINCE ARTHUR."

A. PONTEY begs to announce that he will send out, on Monday, the 14th October, at 1 guinea each, or four plants for 3 guineas, his seedling Pelargonium, for which the highest prize, the Silver Medal, was awarded at the Exhibition of the Royal Devon and Cornwall Horticultural Society on the 16th May; also a certificate of merit was awarded at the Devon and Exeter Exhibition, on the 24th May, and a certificate of merit at Torquay Exhibition on the 6th June.

The Splendid Pelargonium is thus described in the "Floricultural Cabinet," July:—"Upper petals large, dark clouded blotch shaded off to flesh colour, lower ones flesh colour, centre white; petals of firm substance."

Mr. Glenny's opinion of its habits and the peculiarity of its white throat, which he affirms is "purer than that of any one of the present varieties," has been given in the Country Gentleman, weekly garden newspaper.—Aug. 3.

NEW AND FIRST-RATE VERBENAS, FUCHSIAS, PETUNIAS, &c.

GEORGE SMITH begs to draw the attention of the Public to his unrivalled Collection of the above. His VERBENAS have been shown and prizes awarded them at the Royal Botanic Gardens, Regent's-park; the Horticultural Society, Chiswick; the Central Society of Florists; the Royal South London Floricultural Society. Strong Plants of all the foreign and English new varieties are now ready, viz.:—Smith's Calliope, Desdemona, Masterpiece, Monitor, Young's Laura, Letitia, Barker's Mass, Rosa Alba, Gem, Village Maid, Rosy Morn, St. Katherine, Salter's Infant de Versailles, Souvenir de Marie, Electra, Perry's Wonderful, Woodcock's Magnificent, Turner's Mrs. Mills, Chauviere's Adele, Anais, Cyparisse, Gloire de Paris, Niobe, Pauline, Perrier, Reine Hortense, Silene, Miellez, Brind d'Amour, Figaro, Follette, Jeanne d'Arc, Massena, Nigricans, Dufoy's Admiration, Boule de Neige, Anacreon, Buffon, Daubenton, Satyr, Romulus, Boudinot's Bajeans, Celestina, Fanny, Justine, and Madame de Gournay; 12 for 12*s.*, or 24 for 21*s.*

FUCHSIAS.—Smith's Kossuth, Orion, Queen of May, Turner's Sir J. Falstaff, Kendall's Dr. Grosse, Novelty, Glasscock's Mrs. W. Taylor, Beauty of Stortford, Gregory's Cerinium, Actæon, Rumley's Beauty of Richmond, Yorkshire Eclipse, Distinctus, Storey's Mirabilis Unique, Multiplex, Duplex, Ignea, Striata, Miellez, Duchesse de Bordeaux, Elisa Miellez, General Changarnier, General Oudinot, President Porcher, and Dubas's Nonpareil; 21*s.* per doz.

PETUNIAS.—Young's Picta, Letitia, Youngii, Smith's North London Miellez Angele, Triumph, Beauté Parfait, and Ne Plus Ultra. The fine new Lantana delicatissima; Heliotropium corymbosum, 1*s.* 6*d.* each; Cuphea atropurpurea and Donkelarii, 1*s.*

Plants can be sent by post or rail. Extra plants for long carriage. Post-office orders made payable at Islington.

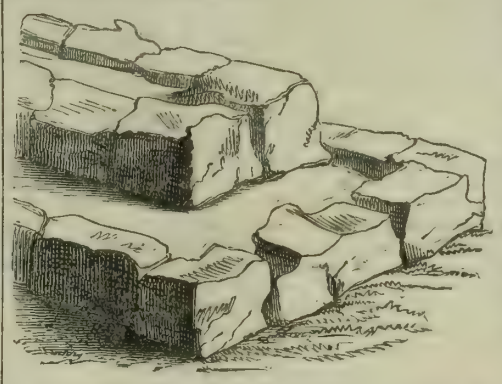
Tollington Nursery, Hornsey-road, Islington, London.

GREENHOUSE AND CONSERVATORY BUILDING ESTABLISHMENT, HOT-WATER APPARATUS MANUFACTORY, KENSALL-GREEN, HARROW-ROAD, LONDON.

JOHN TAYLOR begs most respectfully to call the attention of the Nobility, Gentry, and Gardeners, to the very superior manner in which he erects all kinds of Greenhouses, Conservatories, Forcing Pits, &c., and all other buildings for Horticultural purposes, combining all the most modern improvements with elegance and utility. His manner of heating Horticultural Buildings, Churches, Chapels, Public Buildings, Entrance Halls, &c., has received the greatest approbation from the Nobility and Gentry by whom he has been extensively engaged.

The Gardeners' Chronicle.

SATURDAY, AUGUST 3, 1850.



MEETINGS FOR THE ENSUING WEEK.

TUESDAY, Aug. 6—Horticultural .....3 P.M.

COUNTRY SHOWS.—Tuesday, Aug. 6: Handsworth and Lozells Floral and Horticultural.—Wednesday Aug. 7, and Thursday, Aug. 8: Thirsk Floral and Horticultural.

THE repeal of the brick duty will doubtless lead to the extensive employment in gardens of those half vitrified masses of clay found upon opening kilns, and near London called burrs. Such fragments occur of various sizes and forms, and are the best of all materials for constructing what is commonly called rockwork, but which had better be named burr-work, and which, if properly managed, produces one of the most useful as well as beautiful features in garden scenery. We have already mentioned this on former occasions; to-day we desire to point out how this burr-work may be advantageously applied to the CULTIVATION OF STRAWBERRIES.

In the month of April, 1849, a parallelogram about 6 feet wide was enclosed by a line of burrs resting on the surface of the ground, and about a foot deep. Along the middle of the parallelogram was placed a double line of rude open wall, composed of broken bricks and old stones, to the height of the outer burrs. The whole was filled with rich earth, chiefly cow-dung, up to within 3 or 4 inches of the top. A double line of burrs was then made to cap the double line of wall in the middle, a space of about 6 inches being left between the two lines of burrs. This space was filled with rich earth, consisting of decayed leaves, burnt clay, wood ashes, rotten Grass, and dung; and the same material was employed to top-dress the first formed part of the structure, intervening between the outer line of burrs and the middle lines. The rough open wall above spoken of was provided in order to carry those lines without their settling. When prepared the bed had this appearance.

Two terraces were in fact contrived, of which the upper was single, and the other lower and double. The runners planted on these terraces grew vigourously, and soon covered the ground. In the present summer they came into bearing, and in July were in the following state, loaded with magnificent fruit of the highest excellence attainable by the sorts (British Queens and KEENS' Seedling). A common measurement of the former was from $3\frac{3}{4}$ to $4\frac{1}{2}$ inches in circumference.

In addition to all other advantages, the bed possessed the following; it was thoroughly drained, in consequence of the whole mass of materials being above the ground-level, and the joints between the burrs being open. But although thoroughly drained it was perfectly damp; because the burrs would not allow evaporation to take place except to a moderate extent. It was warm and dry on the surface, in consequence of the heat absorbed by so large a mass of brickwork. Its dryness guarded it from slugs, abounding in the neighbourhood; for they would have nothing to say to the warm dry burrs up which they would have had to crawl in order to reach the fruit. The fruit itself, in huge clusters, was kept quite clean, for it rested on the burrs, having a natural tendency to fall outwards.

We think a plan like this far preferable to Mr. ROBERTS's tiles, or to any contrivance for growing Strawberries on the level ground. In the first place it is cheap, instead of dear; then it looks well, instead of being ugly; thirdly, it harbours no vermin; and moreover it allows rain-water to soak easily into the whole mass of rich materials of which the bed consists. Such beds make a capital enclosure for kitchen gardens: and once made cost nothing further. If the soil is exhausted nothing is easier than to pull the plants out, clear away the impaired materials, and replace them by new soil. If the object is to water the bed, it is only necessary to pour it into holes in the upper terrace, whence it will rapidly diffuse itself through the whole mass. We think too that the entire absence of any weight which can press down the earth in which the Strawberry roots branch, is an important element in success. The burrs rest on the solid ground, or upon rough walls, and the soil among them lies as lightly as if it were in a wheelbarrow. In fact, nothing can compress it, except its own natural weight.

We venture to believe that Strawberry beds of this kind will soon be considered an indispensable part of all gardens in which the best cultivation is combined with the smallest expense.

WHEN one looks through modern BOOKS ON NATURAL HISTORY with unprejudiced eyes, it would appear that the great object of some authors was to mystify their readers. There is not a common thought or thing that is spoken of in common English. A hole is a foramen, a stalk a caudicula or a funiculus, a shield an apothecium; and minute anatomy is called histiology. If we go on in this manner, science will have to take rank with quackery, entomologists will sink to the level of chiropodists, and botanists may yield precedence to thermotherialists and homœopathists.

To avoid these consequences, natural history must address itself more to the feelings and habits of the community. English naturalists must write English, and not indulge in a jargon that can only be paralleled on the stage of a mountebank. Little things dressed up in big words are like the ass in the lion's skin; as soon as they are found out, they become objects of contempt. Let us suppose that a man sets about studying certain modern works which we could point out; that he has mastered endless technicalities, at the expense of much time and trouble; and that having done so, he finds the latter needless, denoting nothing but what his mother tongue would have denoted quite as well; we are afraid that, in such a case, disgust would get the better of zeal, and that he would be apt to apply to the science and its expounder an epithet of two syllables, which we have no doubt that the ingenuity of our readers will readily suggest.

But we shall be assured that our case is stated in terms stronger and more general than the facts will justify; and that the technicalities of which we complain are necessary, if natural history is to have any precision. Undoubtedly, if this be so, we shall have received a conclusive answer; for no means by which precision can be secured will admit of being neglected, and the inconvenience of adopting these means is nothing in comparison with the advantages to be derived from them. But is this so? Do men, by assigning special and strange names to every trifling modification of structure, attain the end proposed? Is it possible, by means of words, however cunningly devised, to give precision to things which have little precision in their nature? To our mind such exactness as is attainable in natural history is, in the majority of cases, to be secured by plain English as well as by crabbed barbarisms. We believe "the curvature of a stem" to be an expression as worthy of adoption as the grand word *Stelechorrhiphysia*.

An example or two will illustrate our meaning better than general allusions. In a work just hot from the press, and a good work too, we read that some mollusks are "*zoophagous;* and these further *evidence* their *resiliancy* from the *phytivorous* families by the character of their egg-repositories. It is true these cannot well be reduced to any of M. L.'s classes, but they are *concamerated nidi* of a peculiar character." We are not sure that we ourselves understand the learned author's meaning; but nevertheless we may venture to assert that the words in italics are wholly unnecessary, and that the sentence if put thus would have been more intelligible, without the loss of such precision as it can pretend to. "Some mollusks feed on other animals, and these further show their distinction from the families which feed on plants, by the character of their egg repositories (qu. nests). It is true these cannot well be reduced to any of M. L.'s classes; but they are chambered nests of a peculiar character." We see no merit in such words as zoophagous, resiliancy, phytivorous, and concamerated nidi.

Our next illustration exemplifies the style of a popular work on Botany, professing to give English descriptions of plants. "A *glabrous* shrub. Branches *terete*. Leaves *distichous*, on short *petioles*, almost *coriaceous*, *obtuse* at the base, *rugose*, *dentate*, with a prominent *costa*. Flowers *secund*. Calyx with *subulate* segments, *saccate* at the base. Corolla *infundibuliform*, *plicate*, *calcarate*, irregular, *ciliated*, with the segments *caudate*. Stamens *exserted*, *heteromorphous*, the *anterior barbate*, the intermediate *arcuate* and *sericeous*, the *posterior complanate*, *clavate*, *fimbriated*, with *setaceous* processes," and so on. If the reader still doubts whether

technicality may not after all be the soul of science, as some will have it, let us beg him to compare the foregoing jargon with the following translation of it into plain English. "A smooth shrub. Branches taper. Leaves in two rows on short stalks, almost leathery, blunt at the base, wrinkled, toothed, with a prominent midrib. Flowers all turned to one side. Calyx with awl-shaped segments, bagged at the base. Corolla funnel-shaped, plaited, spurred, irregular, fringed, with the segments extended into tails. Stamens projecting, of different forms; those in front bearded, in the middle curved and silky, at the back flattened, club-shaped, fringed with bristly processes."

Let us intreat the lovers of hard words to explain in what consisted the necessity of introducing into this description such words as terete, distichous, coriaceous, rugose, dentate, costa, saccate, subulate, arcuate, barbate, complanate, heteromorphous, and so forth. These words are, in truth, Latin and Greek, and it is as absurd for English writers to employ them in translations as it would be for English people to talk Latin and Greek in conversation.

With such examples as the foregoing, we think it not unreasonable to assert that some most important branches of science are swamped by a technical jargon, uncalled for by any exigency, and alike repulsive to good taste and common sense. That a perseverance in its use is fatal to the progress of natural history, we hold to be indisputable, and we earnestly hope that in future those English writers who undertake the task of public instruction, will endeavour to put their ideas into a language to which reason offers no objection, and by which the little educated may profit, as well as the highly educated; for thus alone will it be possible to bring natural science within the reach of all classes.

A CORRESPONDENT having expressed his regret that the number of visitors should have been so small at the late JULY EXHIBITION OF THE HORTICULTURAL SOCIETY, and the same notion having been entertained by others frequenting these London meetings, it seems worth while to show what foundation there is for such ideas. The truth is easily ascertained by the examination of official statements; for the Horticultural Society has never felt it expedient to make a mystery of a matter in which the public is as much interested as anybody.

The following shows the numbers present in July ever since the first establishment of the exhibitions, in the year 1833:

1833	1200	1842	3500
1834	3076	1843	7568
1835	5612	1844	4062
1836	6088	1845	5963
1837	6463	1846	6083
1838	6546	1847	6827
1839	5781	1848	14,084
1840	5072	1849	7338
1841	7194	1850	7970

So that, in reality, the July meeting this year was the largest ever known, with the exception of 1848, when the enormous number of 14,084 persons attended, in consequence of the previous June meeting having been such a day of pouring rain, that only 870 persons, instead of 10,000, passed the gates. That great exhibition did not therefore, at the most, represent beyond 5000 visitors for July.

Let us hope that this short statement of *facts* may serve to show how dangerous, in figures, it is to trust to *fancies*.

VILLA AND SUBURBAN GARDENING.

FEW plants of recent introduction are more handsome or attractive than the Japan Lilies. They come into bloom at a time when the great majority of our New Holland plants are over, and when an actual paucity of flowering plants exists, wherewith to decorate the conservatory and greenhouse, and what really can be more suitable? They produce a gorgeous display either in-doors or out; and as they are quite hardy they may be liberally planted in the open border, and thus constitute one of our best autumnal flower-garden plants.

Their propagation is simple and certain. The bulbs may be separated, and each scale will eventually form a new bulb. This separation should be effected when the flower stems are withered; the scales should be stuck into pans of silver sand, and placed in a cold frame or pit. After remaining one season in this position, they should be planted in a prepared bed of peat soil, and a little silver sand intermixed with it; thus treated the bulbs will soon grow large enough to flower.

The cultivation of them in pots is by no means difficult. I shall detail the practice I have pursued with success for some years. Immediately when the bulbs go to rest in the autumn is the proper time to repot them. By no means destroy the old roots, but carefully place them amongst the fresh soil. If large examples for particular display are required, large pots may be employed, and half a dozen large flowering bulbs placed in each pot. The soil I use is rough peat. The pots should be well drained, and the crown of the bulb just covered with the soil; when potted they should be placed in a cold pit or frame, in order to prevent the soil from freezing, although frost will not injure the bulb. Where room under glass is an object in winter, they may be plunged in the open air in coal ashes, in a manner similar to potted Hyacinths. I have at this time a large number coming into flower, which have never been under glass until within these few days; they have sustained no injury from exposure, and they present every appearance of making a grand display. There is scarcely any plant which is so much benefited by liquid manure as the Lily, more especially before expanding its flowers. If used in a clear state, and considerably diluted, this water alone may be applied for at least a month before it comes into flower.

If the object should be out-door cultivation entirely, I should recommend them to be planted in beds; their effect is exceedingly grand. Excavate the soil 18 inches deep, and fill in the bottom a foot deep with very coarse peat, intermixed with one-fifth of decayed manure or leaf mould. The remaining 6 inches may be entirely peat. If the bulbs are large enough to bloom, plant them 12 inches apart every way, and if beds of each kind are brought into contact with one another, the effect will be magnificent.

The following are the kinds I cultivate: Lilium lancifolium album, L. punctatum, and L. speciosum. The old Japonicum is also well worth growing. *Pharo.*

CARNATIONS AND PICOTEES.

A CURSORY view of the Carnation and Picotee returns recently published by you having created in my mind a strong assurance that instead of the "diversity of opinion" so repeatedly urged as existing amongst Carnation and Picotee growers of the north and south respectively, a singular unanimity prevailed; I pursued the subject, and hand you the following brief digest as the result. I must premise that the returns for the Carnations were obtained from 8 northern and 14 southern cultivators; those for the Picotees, from the same number of northerns, and 15 southerns.

DIGEST OF CARNATION RETURNS.

Where raised.	Varieties.	Raiser.	Returned by Northern.	Returned by Southern.	Total Votes.
	SCARLET BIZARRES.

			70	144	214

North, 70, divided by 8 = 8.75; South, 144, divided by 15 = 9.6.
2 Northern varieties obtaining 12 North, 11 South; Total, 23 votes. Average 11.50.
18 Southern varieties obtaining 58 North, 133 South; Total, 191 votes. Average 10.61.

In the foregoing digest I have dealt only with those varieties which have obtained a number of nominations, equalling, or in excess of, the mean average of their respective classes, as it will be apparent any obtaining a lesser number of votes are exceptional cases, and not such as afford base for argument.

In Carnations it will be observed that 22 varieties are included, and for these the number of northern nominations are 79, whilst the southern nominations are 140, which totals being divided by 8 and 14 respectively, the number of nominations give a result of 9.875 for the north, and 10 for the south. In Picotees, again, the 20 varieties have a total of 214 votes, comprising 70 northern and 144 southern nominations, which divided by 8 and 15, the number of nominations, give a result of 8.75 for the north, and 9.6 for the south. Can anything more indisputably prove the extraordinary unanimity prevailing? and therefore the falsity of the assertion—the "taste of the north does not assimilate to that of the south." Would returns from Rose growers, cultivators of Fuchsias, Calceolarias, Camellias, or Pelargoniums, exhibit a more striking unanimity? Individually, I have ever believed that the "same faith" existed in the northern and southern districts, and I am now more than ever satisfied that before the touchstone of these returns, and the trial exhibitions, these asserted differences will vanish, and

"Like the baseless fabric of a vision,
Leave not a wrack behind."

One other point and then farewell. We are constantly reminded that the northerns have a distaste for a "full flower"—the northerns prefer "colour and purity" to "fulness and size." I was exceedingly struck with these oft repeated remarks when analysing the Picotee list, a reference to which will at once show your readers that "Marris' Prince Albert," heavy purple, one of the largest and fullest of Picotees grown, is returned by six of the northern cultivators, or three-fourths of the whole number, whilst only five, or one-third of the southerns, record their votes for it. Again, "Headley's King James," heavy red, a flower pre-eminently distinguished for colour, but small, is returned by two, only, of the northerns, or one-fourth of the whole, whilst of the southern nominations it commands 12, or four-fifths of the whole number. Verily, after this, how long shall these "differences" exist?

P.S. In the original return, "Wilson's William IV." (S. F.), is described as a southern variety. From information which has since reached me, I find that it was raised at York in 1839, and that it is, consequently, of northern origin. "Holliday's Thomas Hewlett" (C. B.), by a misprint, is described as northern raised. It should be south. *J. Edwards, Holloway.*

THE BAROMETER.

A CORRESPONDENT writes as follows: "Be good enough to inform me what is the variation of the barometer in consequence of elevation, *cæteris paribus*;" and as the instrument is one which is of almost universal use, it seems desirable to answer the question in such a manner as to obviate the necessity of replying to other enquiries that are likely to succeed it. In order to do this satisfactorily, we must go into some details respecting this instrument, the principle of which, simple as it is, seems not to be sufficiently understood. This is evident from the preference generally given to wheel barometers, with their complicated action, instead of being contented with good upright ones, the action of which is direct, simple, and incomparably more faithful than that of the others can possibly be. Many even confound the principle of the barometer with that of the thermometer. It is true the indications of both are usually taken from the greater or less extension of a fluid in a glass tube; but the thermometer acts by the expansion of the fluid by heat; the barometer derives its action from the pressure of the air. Its name implies this, the term barometer being derived from βαρος μετρον; *baros*, weight, and *metron*, measure. From this its use will be recollected; it indicates the weight of the air by the measure of a column of mercury.

Great care and nicety are required in constructing a first-rate barometer; but the principle on which the construction depends is simple, and may be thus explained: Take a glass tube, about 34 inches in length, of uniform bore, and open at one end; fill it with pure mercury; then closing the open end with the finger, invert the tube in a basin or cistern containing mercury; withdraw the finger from the end of the tube thus plunged; fix the tube upright; attach a scale to it, the mensuration of which commences at the level of the surface of the mercury in the cistern; and the result will be a barometer in immediate action.

The tube, of 34 inches in length, will not remain filled to the top with mercury after being inverted. The mercury will fall to some point between 28 and 31 inches; for, near the level of the sea, it has never certainly been known to stand higher than 31 inches, nor lower than 28 in this country, as far as I am aware. We shall suppose that the length of the column is 30 inches, reckoning from the surface of the mercury in the cistern. The space above this and the top of the tube is then void of mercury, air, or any other ponderable substance; in short it is a vacuum, called the Torricellian vacuum, from Torricelli, who invented the barometer in the beginning of the 17th century. It is evident that as much mercury as was contained in this space must have been discharged into the cistern.

From what has been stated, it will be readily acknowledged that the barometer is by no means a com-

plicated instrument. It consists essentially of three parts. 1st. A cistern, containing mercury; 2d. A tube, open at one end, filled with mercury, and inverted in the cistern; 3d. A scale to show the height of the column of mercury in the tube above the surface of the mercury in the cistern. Its mode of action will be best considered by keeping these essentials in view, dispensing with all the usual casings and ornaments.

We have supposed the mercury to stand in the tube void of air at the height of 30 inches; but the height of the column varies almost continually. We shall now endeavour to explain the cause of its elevation, and the reason of its varying, as it is familiarly known to do, without any visible cause.

The air has weight; even when dry it has been found that 100 cubic inches of it weigh a little more than 31 grains, 31.0117 grains, the temperature being 62°. Now, the mercury in the cistern is exposed to the pressure of the air; but there is no air pressing on the mercury in the tube, for, as previously stated, the subsiding of the mercury when the tube was inverted left a vacuum. To this difference of circumstances, namely, the pressure of the air on the mercury in the cistern, and the absence of its pressure on that in the tube, must therefore be ascribed the difference of levels of the respective portions of the same substance. If a hole were drilled in the tube above the mercury, the air would rush in, fill the vacuum, and press as much upon the surface of the mercury in the tube as the external air presses on the surface of the mercury in the cistern. Both portions, that in the tube and that in the cistern, would then be precisely under the same circumstances as regards atmospheric pressure; and both their surfaces would stand exactly at the same level, unless the tube were narrow, in which case the mercury in its base would stand a little lower, in consequence of what is called capillary action.

The cistern may be of any shape; we shall suppose it is perfectly cylindrical, with an outlet at the side, near the bottom, communicating with the lower end of the tube, which we shall also suppose to be bent and tightly fitted into the outlet. Then let a piston be made to fit the cistern, and let it be loaded so as to press with a weight on the square inch equal to 30 cubic inches of mercury, or 14 lbs. 12 oz. 124 grains, for this is the weight of 30 cubic inches of mercury at the temperature of 32°. This weight will be found sufficient to squeeze down the mercury in the cistern and force it up the tube, supposed to be open at top, to the height of 30 inches, and no higher. The pressure of the atmosphere has no share in producing this effect, which is entirely owing to the pressure of the piston on the contents of the cistern; for although the latter bears at the same time the weight of the superincumbent portion of the atmosphere, yet this is completely neutralised by the same amount of atmospheric pressure on the mercury in the open tube. The condition may be thus stated, A being equal to the supposed atmospheric pressure; B equal to a weight of 14 lbs. 12 oz. 124 grains:

EXPERIMENT 1.

Cistern.		*Tube.*
A = Atmospheric pressure	Balancing	A = Atmospheric pressure.
B = Pressure of loaded piston = 14 lbs. 12 oz. 124 grs. to the square inch...	Balancing	Column of 30 inches of mercury = 14 lbs. 12 oz. 124 grs. to the square inch.

If we now double the above pressure by the piston, the tube still open at the top, the balance will be thus constituted:

EXPERIMENT 2.

Cistern.		*Tube.*
A = Atmospheric pressure	Balancing	A = Atmospheric pressure.
B+B = Pressure of loaded piston = 29 lbs. 8 oz. 248 grs. to the square inch	Balancing	Column of 60 inches of mercury = 29 lbs. 8 oz. 248 grs.

Instead of the mercury being thus forced up to the height of 60 inches by metallic weights, let the top of the tube be closed and a vacuum formed in its interior; load the piston, as in experiment 1, and we shall have:

EXPERIMENT 3.

Cistern.		*Tube.*
A = Atmospheric pressure	Balancing	No atmospheric pressure, but column of 30 ins. of mercury.
B = Pressure of loaded piston = 14 lbs. 12 oz. 124 grs. ...	Balancing	Additional 30 inches of column; total, 60 ins. = 29 lbs. 8 oz. 248 grs.

Let A represent the pressure of the atmosphere; and B that of 14 lbs. 12 oz. 124 grs. imposed on the surface of the mercury in the cistern, by means of a loaded piston, as in the preceding experiments. Then,

(1) B = 30 inches of mercury.
(2) B + B = 30 + 30 = 60 inches of mercury.
(3) A + B = 60; and by transposing B, this equation gives
(4) A = 60 − B; by No. 1 B is equal 30, therefore
(5) A = 30 inches of mercury, and also equal to B; so that we may employ either A or B, as in the preceding experiments, with the same effect.

This, we are aware, is not the most concise mode of obtaining the result; but we have adopted it as being plain enough for any one to understand. It shows that whether the column of mercury is 30 or 60 inches in length, it must have an exact counterpoise. If therefore the length of the column be found to have varied, the pressure on the cistern must also have varied; if nothing pressed upon the surface of the mercury in the cistern but air, then the weight of the air must have varied, in proportion to the increased or diminished length of column. If the latter fall from 30 to 29 inches, or one-thirtieth, then its counterpoise, the atmosphere, must be one-thirtieth lighter. Instead of pressing with a weight of 14 lbs. 12 oz. 124 grains on every square inch, its pressure will then be 14 lbs. 4 oz. 182 grains, nearly half a pound less on every square inch; or 637 lbs. 15½ oz. less on every square yard; upwards of 882217 tons on a square mile of the ocean; estimating the specific gravity of sea-water at 1.028, and under this diminished pressure, which frequently occurs, such part of the ocean will rise 13¾ inches above the level it would maintain with a universal pressure equal to 30 inches of mercury.

The fluid usually employed for barometers, constructed on the principle of the Torricellian vacuum, is mercury, because it is the heaviest of all known substances retaining fluidity at ordinary temperatures, and therefore most convenient, on account of its requiring a shorter length of tube to contain a certain weight; and it is also preferable in other respects—for instance it is liable to very little waste from evaporation; and it may be rendered almost free from air and moisture, a condition very desirable, for otherwise their subsequent extrication would render the vacuum to some extent imperfect. Other fluids may, however, be employed on the same principle, provided the tube is made long enough to contain as much of them as will balance the weight of the atmosphere. Accordingly, a water barometer was constructed, and placed in the apartments of the Royal Society, Somerset House; and Luke Howard had one in which linseed oil was the substance employed, because not so readily frozen as water. At the temperature of 60° water is 13.568 times, or a little more than 13½ times lighter than mercury. Therefore when a column of 30 inches of mercury is sufficient to balance the atmosphere, a column of water not less than 33 feet 11$\frac{4}{10}$ inches in height would be required to do the same thing. If a space of 3 inches comprise the extreme range of the fluctuations of a mercurial barometer, the corresponding range in a water barometer would be 40$\frac{2}{4}$ inches. The tube of the water barometer at Somerset House was made of glass by Messrs. Pellatt and Co., at the Falcon glass-house. It was 40 feet long, 1 inch in diameter at the lower end, and tapered to $\frac{8}{10}$ of an inch at the upper end, the extremity being drawn out into a fine tube ready for sealing with the blowpipe; and a small stop-cock was fitted to it. The cistern of this barometer was a small copper steam-boiler, 18 inches long, 11 wide, and 10 deep. It was nearly filled with distilled water. Heat being applied, and steam generated to the extent of the pressure of one atmosphere, the water was forced up the tube, yet open at top, to the height at which it would have stood in the Torricellian vacuum, if such could have been conveniently formed by filling the tube with water, and then inverting it in the cistern. A little more steam pressure would of course be sufficient to force the water to the top of the tube—the height of 40 feet. The tapering extremity was then hermetically closed. The tube was lodged in a wooden case, and secured upright at each convolution of a winding staircase. The water in the cistern was covered to the depth of half an inch with pure castor oil, to prevent evaporation and contact with the air. Ultimately this covering proved insufficient, and Professor Daniell recommended a stratum of oil 4 or 5 inches in depth. Probably, a thin sheet of copper might have been adapted to float on the surface of the oil with advantage. We know, by experience, that the evaporation from the cylinder of a rain-gauge is inappreciable during weeks of dry weather when a copper float fits the cylinder, so as to leave only room to move easily up and down. Instead of a glass tube, Luke Howard employed a lead pipe, bent at the lower end, on the principle of the syphon barometer, so that when the air was light, and the column in the vacuum consequently lowered, the water rose in the open lower end, bent upwards; and the contrary when the air was heavy. A float, with index-rod in this open end, indicated the rise and fall. Changes of temperature, occasioning considerable variations by expansion and contraction in the capacity of the pipe, and alterations in the specific gravity of the fluid, greatly interfered with the indications. Supposing the weight of the atmosphere is balanced by 34 feet of water at 40°; if that identical quantity of water were heated to 60°, it would stand at the height of about 34 feet 2 inches; thus showing a difference of 2 inches, even although no difference may have taken place in the weight of the atmosphere. It must, however, be recollected that the capacity of a leaden pipe will be increased by the expansion resulting from an increase of temperature of 20°, or from 40° to 60°; and this circumstance will counteract the amount of expansion in the column of water nearly $\frac{4}{10}$ of an inch.

In order that the pressure of the atmosphere may be fairly estimated, several corrections are also necessary to be applied to the indications of mercurial barometers. These corrections should be made for *capacity*, *capillary action*, and *temperature*. The correction for capacity depends on the relative capacities of the tube and cistern; the greater the difference between these, the less the amount of correction; and whatever it may be it should always be marked on the instrument. It is now marked by the best makers, and so is likewise the *neutral point*, that is, the point at which the mercury stood when the scale was fixed, and its mensuration commenced from the then level of the surface of the mercury in the cistern. On the event of a fall of 1 inch of the mercury in the tube, that in the cistern will have been augmented by the quantity which must have passed from the tube into the cistern, and its surface will be raised above the zero of the scale in proportion to the relative capacities of the tube and cistern. If the capacity of the cistern is 50 times that of the tube, then the above depression of 1 inch in the tube will raise the mercury in the cistern $\frac{1}{50}$ of an inch, and the instrument would be in such case marked, *Capacity*, $\frac{1}{50}$. In applying the correction, it is is evident that $\frac{1}{50}$ of an inch must be subtracted from the observed height; for if the scale were moveable, as some are, and its commencement adjusted to the now raised level of the mercury in the cistern, the mark, 29 inches, would be $\frac{1}{50}$ of an inch higher than the top of the column. Therefore, it is necessary to divide the difference between the observed height and the neutral point by the capacity, and *subtract* the quotient from the observed height when the latter is below the neutral point; but it must be *added* to the observed height when this is above the neutral point. If the cistern be made large, the omission of this correction will not materially affect the general mean of observations, more especially if the neutral point is fixed at or near the mean height at which the barometer stands in the locality where the instrument is intended to be placed, say 30 inches for places near the level of the sea. In standard barometers the correction for capacity should not exceed $\frac{1}{100}$; in other words, the area of the cistern should be 100 times that of the transverse internal section of the tube, exclusive of the surface occupied by the said section and the glass including it. If the internal diameter of the tube is half an inch, the cistern, in order to be 100 times its capacity, must have a diameter of 5 inches; and to allow for the space occupied by the tube, probably about 0.025 inch more, according to the thickness of the glass. The cistern might be of much smaller dimensions without increasing the amount of correction, provided the diameter of the tube were diminished in proportion. Their capacities would still be as 1 to 100 if the cistern were little more than 2 inches in diameter, and the tube $\frac{2}{10}$ of an inch; but then, in consequence of narrowing the tube, the correction for capillary action would be increased.

Capillary action has the greatest effect in narrow tubes; but it is necessary to observe that its action is quite the reverse as regards mercury and water. If a tube is placed in a basin of mercury, the surface of the portion in the tube is found to be lower than that in the basin; but if a similar tube is placed in a basin of water, the reverse occurs; the water in the tube rises above the level of that outside the tube. The effect, therefore, of capillary action on mercury in barometer glass tubes is to depress the column; the correction has, therefore, to be added. In wide tubes the amount of depression is but little. In a tube of half an inch in diameter, it is only 0.007 inch; but in one of a tenth of an inch, it is 0.142 inch. It is, however, considerably less in boiled tubes.

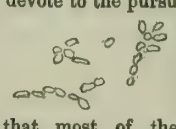
The correction for temperature is the most important, for in hot weather it may amount to the tenth of an inch, or more. According to the experiments of Dulong and Petit, mercury dilates, for every degree of Fahrenheit's thermometer, $\frac{1}{5550}$ of the bulk which it occupied at 32°. All barometers should therefore be furnished with a thermometer, dipping into the cistern, for the purpose of indicating the temperature of the mercury, in order that it may be rendered possible to reduce the observation to some standard temperature; 32° of Fahrenheit's scale, the freezing point of water, and the zero of the centigrade and Reaumur's scales, is the universally adopted temperature to which the mercury is reduced. If a barometer stand at 30 inches, and the temperature of the mercury is 60°, and if at the same time another barometer is placed outside exposed to a temperature of 32°, it will stand 0.085 inch below the other in which the same weight of mercury was expanded in bulk by the excess of 28° of heat. Suppose two barometers were equally correct, and consequently working uniformly under the same circumstances, and that they are standing at 30 inches in a situation which rendered the mercury in each of the temperature of 32°. Remove one to a place where the mercury would acquire the temperature of 66°; presuming the atmospheric pressure has not varied in the mean time, it will be found that the expansion from increase of temperature will be about one-tenth of an inch; and the column in this barometer will stand at 30.100, whilst its fellow continues at 30.000. To-day the atmosphere exerts a certain pressure; to-morrow it may exert precisely the same; but if to-morrow should be warmer than to-day, the barometer will rise and thus lead to the supposition that the air has become heavier; and it is only when the correction for temperature shall have been made that we can come to know that the pressure continues the same. When the temperature of the mercury is above 32°, the correction requires to be *subtracted*; if below 32°, the correction must be *added*.

The best table for correction for temperature is considered to be the one calculated by Professor Schumacher. It is published in a "Report to the Royal Society, of the Committee of Physics, including Meteorology, on the objects of Scientific Enquiry in those Sciences." Taylor, Red Lion-court, Fleet-street. 8vo. 1*s*. This report contains likewise many useful observations and instructions for making meteorological observations, &c. By the tables it contains, all necessary corrections can be made for capacity, capillary action, and temperature. The two former might be generally dispensed with if the cistern were made as much as 5 inches in diameter, and the capacity of the tube $\frac{1}{200}$; for although this arrangement would increase the amount of capillary action, yet as this action

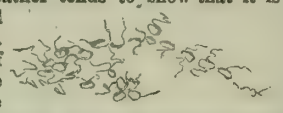
is constant for the same tube, it could be ascertained and allowed for by the maker in the adjustment of the scale.

Frequent reference being made to the observations which have been carried on in the Garden of the Horticultural Society since 1826, it may be proper, whilst on this subject, to state some particulars respecting the Society's barometer, especially as the observations are all corrected, and will consequently exhibit a lower average than others uncorrected, with which they may be compared. The internal diameter of the tube is 0.45 inch, and the capacity $\frac{1}{100}$. The correction is therefore readily made by adding or subtracting one hundredth of the difference which the mercury has risen above, or fallen below the neutral point. The next correction is 0.009 inch, which is constantly added to the observed height, on account of capillary action. The cistern is lined with iron. The tube dips 1.1 inch below the surface of the mercury, and a small thermometer is inserted in it to mark its temperature. The proper correction is always applied for the varying temperature of the mercury, and the entry in the register is the actual pressure of the atmosphere at the station, as it would be measured by a column of mercury of the temperature of 32° Fahrenheit. The position of the barometer is nearly 14 feet above the mean level of high water in the Thames at Chiswick. The observations are taken three times a day, namely at 8 A.M., 1 P.M., and between 9 and 10 P.M., and each observation has the three above-mentioned corrections applied. The barometer thus situated, the average height of the mercurial column, deduced from 20,000 corrected observations, was 29.930.‖

ON MILDEW ON GRAPES.

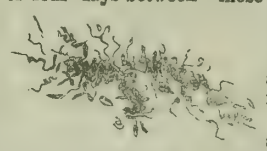


My Grape-house is about 46 feet long by 18 wide, divided with a glass partition and door, and heated by a Polmaise stove, the smoke from the fire of which passes by a flue through the whole extent of the house. In that portion farthest distant from the stove my greenhouse plants are kept, in the other portion plants are wintered until forcing commences in February. The Vines are now in their third year of fruiting, and the crop succeeded well in 1849 in that portion devoted to forcing; in the other portion the Grapes were mildewed, and partially destroyed, those bunches nearest the stem of the Vine being worse.



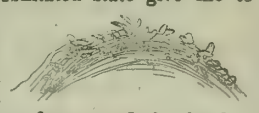
This year the Grapes showed symptoms of mildew first in the greenhouse department, immediately after the Grapes had been thinned; in a short period they became mildewed also in that portion devoted to forcing, and although the fruit had become coloured, it is now nearly destroyed from the effects of the mildew. Everything I could devise as a remedy has been unsuccessful. I first syringed with lime-water, which I fancied had succeeded; but no, the mildew again spread. We then syringed with pure water, and introduced bruised Laurel leaves on the flues, watered profusely, and shut down every sash for 14 hours; portions were syringed with weak tobacco water, other portions with salt and water—the latter destroyed the Grapes, but did no injury to the leaves. The crop is notwithstanding quite spoiled; and in another house, at a short distance therefrom, the disease is also committing its ravages. What is to be done? You mention that "sulphur is only known to effect a cure;" if so, how is it to be applied? Any application will be adopted if a shadow of chance remains of obtaining a remedy. [Dust the sulphur on the white spots the moment they are observable.]

As the knowledge of a disease is half its cure, I have been paying the utmost attention to the progress of the mildew. The attack last year succeeded a week of cold and wet, after previous clear and sunshiny weather—this season was remarkable for its changes of temperature. The disease was first apparent on the 10th of June, the weather then excessively dry, but the nights had been cold; it, in spite of our applications, went on increasing until the Grapes were covered with a white mealy substance, and the wood and leaves also became affected. The first appearance takes place upon the upper surface of the leaf—first a small spot, then a larger, with little hairy substances, like mould or decaying vegetable matter; but that upon the Grapes is a fine floury substance, which, upon moving the bunches, immediately detaches itself. About a week ago I commenced a series of microscopic investigations. This minute substance, when subjected to a highly magnifying power, appears of the form of birds' eggs; or, perhaps, resembles the small oval gelatine capsules sold by chemists, being, like them, transparent. These small substances adhere together by a filament, and have much the appearance of the eggs of snakes—some being strung together continuously, others in clusters. I left a portion of these upon a glass for further examination, as I could not tell then whether they were animal or vegetable. Upon a subsequent examination I found that they had assumed an altered form, the small capsule-looking substances had thrown out filaments similar to those formed in Mushroom spawn by which they were connected, and were evidently diminishing, at the same time throwing out fibres not very unlike the bulbs of Potatoes or Artichokes, adhering similar to the small fibrous roots common to those plants. This convinces me that mildew is a parasitic plant, produced under particular atmospheric circumstances, analogous to that which affects Wheat, producing seeds in abundance, and thus contaminating every branch and every bunch of Grapes in or near the Vinery where it commenced, and extending to the climbing Roses on the outside with equal virulence of character.*



The immediate cause of mildew upon Peas, Cabbages, &c., is the absence of sufficient moisture in the soil, with increased humidity of the atmosphere, especially if the weather is hot and dry by day, succeeded by heavy autumnal dews, and a low temperature at night. If a dry and bright atmosphere in July be succeeded by damp close weather by day, with cold nights, Wheat is liable to be affected; this is supposed to arise from the ordinary vegetation of the plant being arrested, and an undue absorption of moisture by the leaves from the atmosphere taking place, which moisture is carried downwards by the same vessels by which under ordinary circumstances it ascends; this produces disease in the plant, and parasitical plants generally are observed to follow under such circumstances of diseased function.

I shall not enter upon the subject of spontaneous production, although I feel inclined, from some observations I have made, to admit such hypothesis, especially in producing plants of this character; of this I am convinced, that under certain combinations of decaying vegetable matter certain plants of a parasitic character will follow. So with animals in an unhealthy state, parasitic insects abound on them, increasing in numbers and magnitude as the diseased animal becomes more and more reduced. The decaying branch of an Oak tree becomes partially covered with different species of fungus, increasing as the decay advances, until the whole mass is enveloped and absorbed by the new plants. Whatever these minute organised bodies may be, whether seeds of vegetables or eggs of insects, or combining to a certain extent the specific character of both, I am unable to decide, or how they are transmitted to plants on succeeding seasons, I must leave to the investigation of others who have more time than myself to devote to the pursuit; still it is a subject exceedingly worthy of our attention, and especially as regards this in particular affecting the Vine. Last year a few houses in this vicinity only were attacked; lately I have ascertained that most of the houses in the district are becoming affected, which rather tends to show that it is originated or conveyed by atmospheric influence.



I send a sketch of the appearance of these small vessels, in the first, second, and third stages, being made at intervals of four days between—those still upon the Grapes remaining unchanged. I also send a sketch of the edge or disc of the Grape, as it appeared when magnified.

If, as some author asserts, the sap of wood (in an unseasoned state), after remaining dormant many years, will in its debilitated state give life to a species of fungus, then probably we might, by analogy, arrive at something conclusive in this instance. The whole genus Boletus is found to spring from wood in its last stage of decay, and therefore we may infer that the appearance of the white mildew on Vines is secondary, or symptomatic of previously existing disease of the Vine itself. *Robert Baker, Writtle.*

Home Correspondence.

The Espalier Plan of growing Gooseberries.—Being desirous of growing Gooseberries in the greatest possible perfection as regards flavour, and having observed in every work I have seen, without exception, that the espalier form is recommended for the purpose, I was induced last year to try it. Living in Kent, on an arid and gravelly soil, I made a bed of loam, leaf-mould, and garden soil, and planted the trees against an espalier iron rail facing the S.E., and open to the sun on that side, but shaded by trees after 3 P.M. Until the fruit changed colour, the trees were carefully watered both above and below, and also mulched with short Grass. Notwithstanding all this care, before Midsummer many of the leaves turned brown, apparently from the force of the sun, and have since fallen off. The fruit has partly split, and the remainder not over good. Now, the question I wish to ask is, Do you personally happen to know any instance in the dry southern counties where the Gooseberry has succeeded perfectly as an espalier? [No.] It appears to me, *à priori*, that the espalier would be the worst possible form for the Gooseberry. The fruit being borne on the under side of the branch seems to show that it is incapable of bearing the solar rays. We know that even Grapes, natives of hot countries, cannot endure them. Now, the leaves of the Gooseberry are so small that it is obvious they are insufficient to shelter the fruit if the tree is trained as an espalier, and if the crop is expected from young wood. The case may possibly be different where old wood covered with a multitude of confused projecting snags is employed. It is evident that Mr. Loudon adopted the latter plan, for he says "keep the branches a foot apart, and spur them in." Being plagued with birds, I shall be sorry to give up my espaliers, as they are so easily netted. *G. S., Bromley.*

* If Mr. Baker will refer to our volume for 1847, p. 779, he will find a much more exact account of this parasite under the name of Oidium Tuckeri, the Egg Mildew.

The Cuckoo.—I am much gratified by the notice taken of the cuckoo note. I have lived nearly 40 years in this district, and have been very attentive to birds, yet I have never observed the three notes before. Labouring people are not much to be depended upon for accurate information; but no one, so far as I can make out, has heard this note before. May it not be an individual peculiarity? The song of young birds is deficient in volume and extent. I had hoped that Mr. Doubleday, or some other good natural historian, would have noticed the statement. *Este, Welling, July 24.*

Summer Pruning.—When I penned the article on summer pruning the Vine, I did so with the intention of eliciting from competent authorities opinions as to the real connexion existing between the branches and the roots of a plant, under certain stated conditions; and "Lumbricus" misinterprets my motives when he attributes to me the concealed intention of criticising the practical directions of the Calendar, merely choosing the Vine as a cloak to my real motive. Nothing could have been further from my desire. However ill I might have expressed myself in the article in question, and whatever grounds there might appear for the conclusions at which "Lumbricus" arrives, I confess they were unknown to me (because I had not intended them), till the appearance of Mr. Toogood's and the last named correspondent's letters. I had hoped that the closing sentence of that article sufficiently explained my object—the attainment of truth. I had chosen the Vine as an illustrative example of a practice said to be based on certain physiological principles, which principles and practice I have been—after giving the subject much consideration—unable to harmonise. The passage in the Calendar seemed to me to refer to a similar practice based on precisely the same principles, and I alluded to it as a secondary example of what I considered an incongruity between a principle and a practice founded from it. It cannot be denied that it is a fashion in current garden literature (and a most excellent practice when rightly applied it is), to ascribe a principle as the basis of every garden operation. We lay down a certain practice, and then look about for a principle as a foundation for it. No one will deny but that the principle should be correctly established. My argument was (or at least I intended it to be so), that the practice of allowing Vines at certain seasons of their growth to produce laterals did not augment root action, as is by some said to be effected; but that, on the contrary, the practice weakened the whole fabric of the plant. And the principle is applicable to the greater portion of the vegetable kingdom. With the production of fruitfulness directly my argument did not apply, but merely to the connection existing, under artificial treatment, between the branch and the root. The philosophy of summer pruning in general gardening is as yet only in its infancy. Very much remains to be correctly established. Everything in the well being of a tree depends on a good system of summer pruning, and future gardeners in general, like a few in the present day, will reduce winter pruning to a sinecure in their routine. Neither Mr. Toogood nor "Lumbricus" have alluded to the question, or at least but very imperfectly, which it was my intention to raise when penning the article on the Vine. Of course I never dreamed of attempting to establish the same routine of treatment for the Peach as for the Vine! although "Lumbricus" would infer that I did so. *George Lovell.*

The Potato Disease has attacked the gardens situated in the villages under the chalk hills which form the southern boundary of the vale of Blackmoor, in Dorsetshire. I enclose a specimen of the haulm, but this, I am sorry to say, is an imperfect measure of the progress of the disease. The tubers are most seriously affected, and are rotting very fast. *D. C. L.*—— The Potato disease has made its appearance in its worst form in Wilts and Somerset, especially near Bath, and the plants smell badly. In many instances the haulm is quite black. The tubers are safe as yet, but this cannot long continue. *R. Glendinning.*——The disease is showing itself in certain localities in Essex. I have had a piece, about 5 poles in extent, much struck with it, and have had them immediately cleared off the ground. I have heard of it in other places in a much greater extent. The disease first showed itself where cinder-ashes had been used. *Wm. Fisk.* —— Early dwarf Potatoes are uninfected here as yet, but during the past week symptoms of disease have been appearing in late kinds. Rumours from other localities report cases to be more rife, but the public should bear in mind that "as long as the stalks and leaves continue healthy-looking, so are the tubers." Thousands of tons of premature growth are unnecessarily glutting our markets, thus a sad sacrifice of food and land is the consequence, a circumstance much to be deplored, as it opens up a medium for thousands of tons to be imported to this country, as was the case last year. Statistics clearly proved that this injudicious practice reduced the home produce of Potatoes so as to leave no more than ample sufficiencies for seed, without taking into account the loss of land. *Hardy and Son, Maldon, Essex.*——I beg to send you nine Potatoes, the produce of one root; the variety is Egyptian Kidney. It comes in as a second crop, Ash-leaves being the first. The latter were quite free from disease; but, in the sample sent, two of the crop are in a sad state; and even those which I have had washed, in my opinion, indicate the coming failure. A second root was taken up, and three of the tubers proved bad; the failure of the two roots making about 25 per cent. diseased. The weight of produce of one root was 1 lb. 3 oz.; the

second (now sent) is 1¼ lb. My Shaws, intended for a later crop, present no unhealthy appearance as yet. *John Edwards, Wace Cottage, Holloway.*——Disease is very prevalent in this city and neighbourhood, and also in the districts more remote. Since the 17th July the weather has been unsettled, with thunder and sultry heat. Previously the Potato plant was flourishing most luxuriantly, but within the last week or so the desolation has been spreading rapidly, without regard to soil or situation, *i.e.* in our flat country and on the hills, in the loam, and in the sand. In some of our gardens the crop has already been taken up, although not in a sufficiently ripe state. It is, I confess, much to be feared that the disease will in this year be much more serious than it was in the last (so sudden has been the attack, and so general is its prevalence), considering that it has commenced rather earlier than usual. *W. Watkins, Chichester, Aug.* 1.——Disease is coming on here with terrible rapidity and suddenness. Plants that one day are apparently perfect in haulm and leaves, the next are half destroyed. The tubers do not seem to be as yet much affected. *E. S. Dixon, Cringleford, Norwich, Aug.* 1.

July Frosts and the Potato Disease. Some persons in this neighbourhood persist in ascribing the black appearance of the Potato leaves to frost. Many farmers and gardeners speak of severe frosts as frequently occurring. I wish to know whether there is any instance on record of the thermometer in the south of England being as low as 32° in the month of July. *D. C. L., Blandford.* [We know of no such instance.]

The Kaisha Apricot.—A description of this Apricot is given in the Horticultural Society's Journal, for July, 1849. I believe you are aware that Mr. Warmington has transferred the stock of it to us, together with the whole of his collection of Syrian fruits, received from the late Mr. Barker of Suædia. The tree which fruited with Mr. Warmington, of the Kaisha Apricot, received an injury in the removal, but it has this year produced five or six fruit, two of which we send for your opinion. The first fruit ripened on a west wall on the 15th of July, and there is only one small fruit left. They are not so large, we expect, as those sent by Mr. Warmington, but the tree is weak. We should like to have sent up some fruit to one of the Society's Exhibitions, but the late grand agricultural meeting, &c., prevented it. We consider that under good cultivation this Apricot will prove a valuable early kind. *James Veitch and Son, Exeter.* [The fruit sent was the Kaisha, described in the Journal of the Horticultural Society, and by far the earliest Apricot of good quality in this country.]

The Puzzle.—The answers given July 27, are clever; but not correct. For the guidance of querists next week, I will mention that the name of the tree consists of six letters, and two syllables. *H. S.*

Bug Bites.—"A. C." asks for something to allay the itching of bug bites, and is told to kill the bugs. Good. But how is a poor traveller who gets to an inn late at night to do this? Whether bugs bite all, but that some persons are not susceptible of their poison, or whether they daintily avoid those who boast "bugs never touch me," I do not know; but as their bites always produce great inflammation upon me, and I have a remedy which with me is perfectly effectual, I have pleasure in making it known. Immediately upon being bitten, go to the wash-stand and rub the part with soap dipped in water, and let the application dry on the skin. This never fails with me, but the pain of the bite always wakes me, and the application is therefore quickly applied; possibly it may not be so effectual upon those who do not discover the infliction until some hours afterwards. Probably any alkaline solution might have the same effect, but soap is rarely absent in this country, and its action with me is so complete as to leave not a trace of the effect of the bite. Sleeping with a light, or the means of procuring one, rarely fails in slaying the enemy. Common mercurial ointment should be put into the mortices of bedsteads infested with these odious vermin. *C. M., Ipswich.* [Spirits of turpentine sprinkled on the linen of a suspected bed will drive the bugs away.]

Summer Pruning.—I fully understand Mr. Lovell's article to be a "physiological query," but the application of a principle to grow Vines without stopping is far beyond my comprehension. I was not aware of the views Mr. L. intended to be taken of his remarks, but feel it impossible to draw other inferences. That a just gradation between root and branch is the primary and most essential point towards successful cultivation, there can be no doubt; but how that gradation is to be obtained and preserved without stopping, I shall feel greatly obliged if Mr. L. can communicate. Do we not increase and stimulate a luxuriant growth by every means zeal and ingenuity can suggest, and can the luxuriance thus obtained be monopolised by any other means so beneficially as a judicious system of stopping? Mr. L. admits himself to be the advocate of a practice, the principle of which he deprecates; and I trust for the information of all it may influence, he will give us a line explanatory of the subject, and the system to be pursued. *W. Toogood, Southampton.*

Societies.

GRAND TRIAL EXHIBITIONS (open to all England).—NORTHERN v. SOUTHERN-RAISED CARNATIONS AND PICOTEES.—The exhibition for the southern division was held at the Royal Nursery, Slough, on July 25th. This exhibition, which was instituted for the purpose of testing the merits of northern and southern-raised Carnations and Picotees, has excited considerable interest amongst the growers of these flowers for some time past, and a fine display was the result. Nearly 30 stands were put up for competition, independently of a large number of blooms for class showing. From the following awards it will be seen that southern-raised flowers gained the day, both in Carnations and Picotees. Northern-raised Carnations, 6 blooms: 1st, Mr. Turner, Slough, for Admiral Curzon, Princess (Taylor), Premier (Millwood), Cradley Pet, Splendour, and Lord Milton; 2d, Mr. Barringer, Bedford, for Paul Pry, King of Scarlets, Admiral Curzon, Lord Milton, Premier, and Lovely Ann; 3d, Mr. Dodwell, Derby, for Premier, Admiral Curzon, Seedling, Beauty of Woodhouse, Squire Trow, and Pyracanthus; 4th, Mr. Bragg, Slough, for Defiance, Squire Trow, Henry Kirke White, Paul Pry, King of Scarlets, and Beauty of Woodhouse; 5th, Mr. Willmer, Sunbury, for King of Scarlets, Victory, True Briton, Squire Meynell, Rainbow, and Queen of England. Southern Carnations: 1st, Mr. Turner, for Duncan (May), Justice Shallow (May), Princess Royal (Puxley), Howard (Puxley), Owen Glendower (May), and Lorenzo (May); 2d, Mr. Bragg, for Flora's Garland, Hero of Middlesex, Prince Albert, Prince Arthur, Sarah Payne, and Conquering Hero; 3d, Mr. Keynes, Salisbury, for Prince Albert (Hale), Sarah Payne, Flora's Garland, Prince of Wales (Puxley), Lord Rancliffe, and Prince Albert (Puxley); 4th, Morgan May, Esq., Sonning, for Timon (May), Percy (May), Falconbridge (May), Bardolph (May), Bolinbroke (May), and Prince Albert (Puxley); 5th, Mr. Edwards, Holloway, for Sarah Payne, Harriet, Prince Albert (Hale), Julia, Flora's Garland, and Lydia. Southern Picotees: 1st, Mr. Turner, for Princess Royal (Willmer), Gem (Youell), Ophelia (May), Mrs. Barnard (Barnard), Queen Victoria (Green), and Cressida (May); 2d, Mr. Lockner, Paddington, for Princess Royal, Lady Harriet Moore (Turner), Lorina, Queen Victoria (Green), Mrs. Barnard, and Amy; 3d, Mr. May, for Cleopatra, Juliet, Ophelia, Viola, Princess Royal, and Beatrice; 4th, Mr. Bragg, for Gem, Venus, Princess Royal, Portia, Lady Alice Peel, and Jenny Lind; 5th, Mr. Keynes, for Lady Harriet Moore, Isabella (Wildman), Juliet (May), Princess Royal (Willmer), Useful (Sealey), and Mrs. Barnard. Northern Picotees: 1st, Mr. Dodwell, for Mary (Dodwell), Miss Rosa (Merryweather), Prince of Wales (Marris), Alfred (Dodwell), Prince Albert (Marris), and Seedling 26 (Dodwell); 2d, Mr. Turner, for Prince Albert (Marris), Unexpected (Marris), Prince of Wales (Marris), Duke of Rutland (Hollyoake), Alfred (Dodwell), and Mary (Dodwell); 3d, Mr. Keynes, for Proconsul, Emma, Prince Albert, Lady Sale, Lord John Russell, and Privateer; 4th, Mr. Willmer, for Mr. Green, Prince of Wales, Field Marshal, Fair Ellen, Emperor, and Emily. The premier prizes between the first stands of northern and southern flowers had to be decided after the other award. Mr. Turner's stands of southern-raised flowers gained the premier prizes, both in Carnations and Picotees. Class showing Carnations—Scarlet Bizarres: 1st, Mr. Turner, for Emperor (Puxley); 2d, Do., for Admiral Curzon; 3d, Mr. Keynes, for Prince Albert (Hale); 4th, Mr. Turner, for Bardolph (May). Crimson Bizarres: 1st, Mr. Turner, for Lord Milton; 2d, Mr. Young, Twyford, for Seedling; 3d, Do., for Seedling; 4th, Mr. Turner, for Lord Milton. Pink Bizarres: 1st, Mr. Turner, for Henry Kirke White (Taylor); 2d, Mr. May, for Falconbridge (May); 3d, Mr. Turner, for Falconbridge (May); 4th, Mr. Keynes, for Twyford Perfection. Scarlet Flakes: 1st, Mr. Turner, for Jutice Shallow (May); 2d, Mr. Keynes, for Wm. IV.; 3d, Mr. Turner, for Justice Shallow (May); 4th, Mr. Edwards, for Lydia. Purple Flakes: 1st, Mr. Adams, for Premier (Millwood); 2d, Mr. Turner, for Perfection (Puxley); 3d, Do., for Great Northern (Ely); 4th, Mr. Adams, for Lord Byron. Pink Flakes: 1st, Mr. Willmer, for Flora's Garland; 2d, Mr. Adams, for Prince Arthur; 3d, Mr. Willmer, for Rosetta; 4th, Mr. Turner, for Ariel (May). Picotees—Heavy Red Edge: 1st, Mr. Adams, for Prince of Wales (Marris); 2d, Mr. Dodwell, for Prince of Wales (Marris); 3d, Do, for Prince of Wales (Marris); 4th, Mr. Turner, for King James (Headley). Light Red Edge: 1st, Mr. Dodwell for Mary (Dodwell); 2d, Do., for Mary (Dodwell); 3d, Rev. A. Matthews, for Cassandra; 4th, Mr. Turner, for Gem (Youell). Light Purple: 1st, Mr. Turner, for Prince Albert; 2d, Mr. Bragg, for Juliet; 3d, Rev. A. Matthews, for Purity; 4th, Do., for Circe. Heavy Purple: 1st, Mr. Turner, for Alfred (Dodwell); 2d, Do., for Viola (May); 3d, Do., for Seedling (May); 4th, Mr. May, for Viola. Light Rose: 1st, Mr. Turner, for Mrs. Barnard; 2d, Do., for Mrs. Barnard; 3d, Do., for Mrs. Barnard; 4th, Do., for Countess How (Hollyoake). Heavy Rose: 1st, Mr. Turner, for Queen Victoria (Green); 2d, Do., for Venus (Headley); 3d, Do., for Venus (Headley); 4th, Do., for Unexpected (Marris). The next meeting takes place at Derby on the 7th August. We intend giving a few remarks on the new flowers in our next.

Reviews.

Cholera and its Cures; an Historical Sketch. By J. S. Bushnan, M.D. 8vo. Orr and Co., London. Pp. 169.

DR. BUSHNAN says that the only successful mode of treating cholera is the saline method of Dr. Stevens; ridicules all others, giving a list of them 16 pages long; and charges Sir David Barry and Mr. Wakefield, of Coldbath-fields prison, with having, for interested purposes, made a "determined effort" to mislead the public, by evasion, suppression, misrepresentation, and falsehood. We cannot examine the charges made by Dr. Bushnan, we merely point out to the profession their existence.

Chemistry in connection with Agriculture. By H. N. Noad. 8vo. Baldwin, London. Pp. 116.

These lectures, delivered at the Literary and Scientific Institution of Colchester, are "printed nearly in the form in which they were given, at the request of the farmers who attended them." We think the Essex farmers showed their good sense in this, and we trust that other farmers will imitate their example by reading them. They contain much useful practical matter, explained in a clear unpretending style.

Miscellaneous.

Luminous Plants.—Vague ideas of their existence in India and the neighbouring countries float about now as in the days of the old Hindoos and Greeks; they are in some cases, perhaps, founded on facts, in others on electric appearances. In the Journal of the Agricultural Society of Bengal, No. 153, p. 688, we read that in Affghanistan "to the north of Nahoo, is a mountain called Sufed Koh, in which the natives believe gold and silver to exist, and in which they say in the spring is a bush which at night from a distance appears on fire, but on approaching it, the delusion vanishes." Baron Hügel (p. 143) was told that the Auk river in Kashmeer, when swollen with rain, brings down from Tibet pieces of timber which "shine in the dark as long as they continue moist." Our officers at Peshawur might, perhaps, find out some particulars of the Sufed Koh vegetable luminary; the account, if a fiction, is at all events an old one, and seems identical with that given by Pliny (XXI. 36) of the "Nyctegretum" of the text, which is this: "Nyctegretum inter pauca miratus est Democritus, coloris hysgini, folio spinæ, nec a terra se attolentem, præcipuam in Gedrosia narrat. Ervi *post æquinoctium vernum* radicitus, siccarique ad lunam triginta diebus, ita lucere noctibus. Magos Parthorumque reges uti hac herba ad vota auscipienda. Eamdem vocari chenomychon quoniam anseres a primo conspectu ejus expavescant (!) ab aliis nyctalopa, quoniam *e longinquo* noctibus fulgeat." The rootstock of a plant from the Ooraghum jungles, at the foot of the Madura hills, near Trichoor, supposed to be an Orchid or Marica, was exhibited in April, 1845, at a meeting of the Royal As. Society, possessing "the peculiar property of regaining its phosphorescent appearance when a dried fragment is subjected to moisture, gleaming in the dark with all the vividness of the glow-worm or the electric *Scolopendra*, after having been moistened with a wet cloth applied to its surface for an hour or two; and it does not seems to lose the property by use, becoming lustreless when dry, and lighting up again whenever moistened." The *Gardeners' Chronicle* (Dr. Lindley) states "that a small slice of the dried root being wrapped in a wet cloth, and allowed to remain about an hour, shines in the dark like a piece of phosphorus, or perhaps somewhat paler, more like dead fish or rotten wood." It is stated to have been long familiar to the Brahmans under the name of Jyotismati, erroneously referred in the Lexicons to Cardiospermum, perhaps on account of the white crescent on its black seed. The discovery of the Coromandel plant was made by a Tuhseeldar, compelled by rain to take shelter at night under a mass of rock, where he was astonished to see a blaze of phosphoric light over all the Grass in the vicinity. Sanscrit authorities refer the Jyotismati to the Himalaya; and on enquiry at Almorah, I found there was a luminous plant well known there by that name, and "Jwalia-mat;" implying the possession of light or fire. It turned out to be Anthistiria anathera, of which perhaps one root in a hundred is luminous by night during the rainy season. Other Grasses, Andropogon contortus, Iwaruncusa, &c., are reported to possess the same property; and both Hindoos and Moslems are persuaded of the existence of a plant called Sunee (the Sanscrit Sunjeevun); extolled for its power of revealing the wonders of fairy-land; and eagerly sought by fukeers and serpents. In 1845, the people of Simlah were open-mouthed with a rumour that the mountains near Syree were illuminated nightly by this magical herb. But it is probably Dictamnus which has occasioned many of these reports; it abounds near Gungotree and Jumnotree, and supposing it to exhibit the same phenomena as its European congener, the fame of a bush burning but not consumed would be bruited afar by the pilgrims among a people ever ready to deify any peculiar manifestation of fire. Professor Henslow explains the inflammable atmosphere generated on a calm still evening about Dictamnus fraxinella by the evaporation of a volatile oil; and states that, "If a candle be brought near it, this plant is enveloped by a transient flame without sustaining any injury from the experiment." The Rughoovuns alludes to fire latent in the Sumee, supposed to be Prosopis spicigera, the Jhund of northern India; but the reference may be to fire obtained by friction. *Major Madden, in the Journal of the Agricultural and Horticultural Society of India.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

LET shading be used less frequently, and for a shorter number of hours as the season advances. The heat of the solar ray is rarely too powerful now, even if it were the growing season; and as the plants ought now to be ripening their growth, they have need of not only all the daylight, but even moderate sunshine. In the case of Orchids this is especially necessary, that the roots, leaves, and pseudo-bulbs may be thoroughly matured. Those which are already in this state, or nearly so, should be removed forthwith to a cool house. Great care should be taken not to excite such plants into a new growth at this time, as it is much too late to get them properly matured, and the unseasonable draught upon the stored energies of the plants will materially interfere with their next production of flowers. Dendrobiums of the D. nobile character, which are sufficiently advanced in growth should also be removed to a cooler house, where they should be supplied with a moderate temperature, abundance of air, and scarcely any water, till their stems are ripened and their flower buds formed. Those Orchids which are in a growing state should be placed in the most favourable positions, and encouraged by a high temperature, so long as the strength of daylight will admit of such a course.

FORCING DEPARTMENT.

PINERIES.—Maintain a high moist temperature, with abundance of ventilation, to Pines which are now swelling their fruits; and a rather drier atmosphere around those which are in flower. In all the stages except that last mentioned, use the syringe freely, in very fine weather, when there is a certainty of the moisture evaporating by the heat of the sun; but, on dull days, depend almost entirely upon the evaporating troughs, and be careful to admit air, to prevent too great a condensation of moisture. If the syringe is used in excess during this month, it is liable to render the soil too wet for the healthy development of the plants. Take care that the bottom-heat does not get too strong for plants which have been recently potted or planted. VINERIES.—When the late crops have done stoning, the borders, both inside and out, should have a good soaking of liquid manure, to assist the swelling of the fruit. Do not

allow the process to go on too sluggishly, if they are of kinds adapted and intended for late keeping. Muscats ripened with the aid of the summer sun, by the end of August, are infinitely superior, both in appearance, flavour, and keeping, to those which are dawdled on through the next two months. The Vines in a more forward stage, on which the Grapes are just beginning to ripen, should be gradually inured to a freer admission of air; and if it be desired to keep for any length of time those which are quite ripe, they should have the advantage of a slight shading during very hot or scorching weather.

FLOWER GARDEN AND SHRUBBERIES.

Cuttings of Roses should be taken immediately and planted in a close cold frame in a north aspect for three weeks or a month, until they are cicatrised at the base; they should then be taken carefully up, potted in thumb pots, and plunged in a close warm frame with a gentle bottom heat. So treated, they will make nice plants in a very short time, and if kept under slight protection during winter, will fill their pots with roots, and be ready for planting out in April or May. Pink pipings, if put in at the time we recommended, will now be ready for transplanting; and in doing this not a moment should be lost, as they have need of all the rest of the season to establish themselves in such a manner as to prevent the frost injuring them. If the situations ultimately intended for them are vacant, they should be planted in them at once, as they thereby flower much finer; but if these places are occupied for the present by something else, the young Pinks should be planted 4 inches apart, on reserve beds in an open situation, the soil of which should consist principally of light loam, to which has been added some charcoal dust or charred refuse; a little dung mixed with road drift and soot should be added. The rotten manure from an old Mushroom bed answers very well for this purpose, as it encourages a mass of fibres, and produces a healthy but over-gross development of top. Some time ago we promised to remind our readers about making memoranda of the most suitable arrangement for half-hardy plants next season; we are just now doing so ourselves, and we take this opportunity of redeeming our pledge. As an easy method of reducing the thing more completely to a system, a rough plan should be made of the arrangement of the beds, which should be numbered, and referred to an accompanying list of the names of the plants, with which it is designed to fill them next year, and the quantity required for each bed. By compiling a summary from this list, accurate information is at once obtained of the quantity of plants which must be propagated immediately by cuttings, and both by these and seeds in spring. By this simple means, redundancy and deficiencies are avoided, disappointment is prevented on the one hand, and waste of labour on the other. Whilst the half-hardy plants are in their greatest beauty, a tasteful eye will easily discover the weak and improvable points, and, by observing the more satisfactory parts, will readily perceive the most desirable future arrangement.

FLORISTS' FLOWERS.

Plant out the second crop of Pink pipings, taking care to examine the beds rather late in the evening; worms may then be caught, and every Pink grower knows how often they make great confusion amongst his stock, by loosening the pipings, and very often drawing them together in heaps. Take care that Dahlias have abundance of water, keeping the roots well mulched with rotten manure. Let the lateral shoots be sedulously attended to, by tying them out. Encourage the weakest seedlings, for it very frequently happens that they are the best, and generally bloom the very last of the collection. Carnations and Picotees are fast getting out of bloom; proceed rapidly with layering; use leaden pegs to fasten the layers down; these are preferable to Fern or Braken ones. Amongst stars that have come under our observation this season are Bunn's Lord Lewisham (S.B.), May's Ophelia, light purple Picotee; Robinson's Elizabeth, splendid heavy-edged red; Marris's Jeannette and Mrs. Hemans, rose Picotees. Whilst such flowers as these reward the pains-taking florist, every one who grows Carnations and Picotees ought to emulate them, by carefully crossing, saving, and sowing the seed. Auriculas, Polyanthuses, and Pansies must all have their share of attention, keeping them clean and free from insects; the former is often pestered with green fly; this may readily be removed with a soft brush—perhaps as easy and effectual a way as any.

FRUIT GARDEN.

Strawberries.—In places where the work is kept in a forward state, it may be presumed that by this time a sufficiency has been potted for forcing, and that all the new plantations have been properly prepared and planted. As the fruit is all gathered, the old exhausted beds may be at once destroyed—preserving the younger, one or two year old beds, to afford the main supply next season; and it should be an object of especial attention to cultivate these plants in such a manner that they shall produce an abundant crop. As no more runners are required, those which remain should be cleared away, but taking care not to injure the leaves of the plants. Their growth during the remainder of the season should be encouraged by forking some very rich well rotted manure into the ground about the plants. It is a point of the first importance to preserve the old foliage uninjured; as upon it depends the perfect elaboration of the sap for the production of next year's crop.

KITCHEN GARDEN.

No time should be lost in sowing the main crops of winter Spinach in good rich ground, deeply trenched; and, if the soil is of a heavy nature, the operations should proceed simultaneously, as the soil is thereby left in a loose, uncompressed state. Avoid thick sowing in all cases; the rows should stand about 16 inches apart, to allow a free passage between the rows for forking, cleaning, and gathering the crop. At the first gathering every other plant should be drawn out entirely; thus giving additional space to those plants which are to produce the late winter and spring supply. Some strong, well-curled plants should be selected from the spring sowing of Parsley, carefully lifted with large balls, and planted at the foot of a south wall. A quantity planted in boxes proves very useful during a long continuance of severe weather in winter, as they can be placed in a cool Peach-house, or similar situation. Let the early kinds of Potatoes be got up as soon as the tops are ripe enough; and let particular pains be taken to pick out all the tubers, as those left in the ground are very annoying in future years. Let the produce be sorted, and if of an approved kind, let all the small and moderate sized tubers be carefully preserved in dry sand or charcoal dust. Be at a little trouble also to test the different varieties, and do not allow your number of sorts to exceed half a dozen, selecting those only which are most liked on table, free croppers, early in coming to perfection, and least liable to be affected with disease. Many of the medicinal and pot herbs, commonly cultivated in gardens, will require gathering this month; the proper time is just when they are in full flower. They should be cut quite clean on a fine warm day, tied in small bunches, and hung up in an airy room till they are perfectly dry; after which they should be put into tin canisters, glass bottles, or paper bags, to preserve them from dust. Either of the former contrivances are preferable to the latter, as they guard the herbs against damp, and prevent the escape of their delicate aroma; along with which their virtues are in a great measure evaporated. Continue, as time and space occur, to plant Cauliflowers for late autumn use, and Broccoli, Savoys, Brussels Sprouts, &c., for winter. Make a small sowing of Flanders Spinach, to succeed the last sowing of round or summer Spinach; also a sowing of York and Vanack Cabbage for winter and early spring use. A sowing of Onions should now be made, rather thick, for spring use. Pull Shallots, and lay them on a gravel walk or dry ground for a few days before removing them to the store room. Onions also will require attention when ready. Plant out some York Cabbages for early winter use, 6 inches apart and a foot between the rows; this will give room enough for the best dwarf kinds, as every other one can be removed while young, and thus leave room for the rest to grow larger.

State of the Weather near London, for the week ending Aug. 1, 1850, as observed at the Horticultural Garden, Chiswick.

July and August.	Moon's Age.	Barometer. Max.	Barometer. Min.	Temperature. Of the Air. Max.	Min.	Mean	Of the Earth. 1 foot deep.	2 feet deep.	Wind.	Rain.

The highest temperature during the above period occurred on the 10th, 1842—therm. 93 deg.; and the lowest on the 6th, 1833—therm. 36 deg.

Notices to Correspondents.

To our Correspondents.—May we beg it to be understood that *we cannot answer inquiries privately through the post.* We are ready to give reasonable information through our columns, but we cannot consent to the labour of writing letters.

Bees: *Juvenis.* You may remove above a third of the combs of the stock in the ceiling of your verandah, and if you use thick worsted gloves in the place of leather ones, you will not lose those bees, by the loss of their stings, that may attack you. Being in a difficult situation, it would add much to your comfort in the operation by having an assistant with one of Brown's patent fumigators, who might give them a puff or two of tobacco smoke occasionally while you are taking the comb. *Y.—A Young Beginner.* Raise the hive about half an inch on three or four wedges until the temperature becomes lower. *Y.*

Clerodendrons: *T B M.* At least 50 kinds are known in gardens, and we cannot occupy space with such lists. You should consult Mrs. Loudon's "Hortus Britannicus," just published.

Cotton Seed: *C.* This is not procurable in England. You must send to New Orleans for it; Madras and Bourbon would supply Natal settlers, if they have any ready communication with those places. As to Tobacco, the finest American is prepared from the Nicotiana Tabacum, sold in every seed shop. The excellence of Tobacco does not depend upon the sort, but upon the preparation of it, and the climate in which it grows. Plantains may be had at Madeira, and Date Palms will grow from the stones of the newly arrived fruit; so that no difficulty need be experienced as regards them.

Fern: *W H F C.* You cannot raise Fern from seeds. The only way is to dig up the roots in November and plant them immediately. Those of the common Brake, which you probably mean, lie very deep, and are troublesome to get at; the black underground branches which people take for roots are subterranean stems, which will not grow

Fern House: *R J G.* Nothing will grow in the atmosphere you describe, if kept in it permanently. You should grow the front plants elsewhere, and only bring them in occasionally. Æschynanths, Hoyas, Dendrobium pulchellum, some Aerides and Vandas would like it well enough for a month or two at a time—but not for more—if they are to flower.

Fruits: *Sub.* The following are six of the best sorts of Melons: Bromham-hall Green-fleshed, Trentham Hybrid, Beechwood, Benares, Egyptian Green-fleshed, and the Pine-apple Melon, the latter though small is of excellent flavour. The best sort of pale yellow or white Raspberry is the Yellow Antwerp. The white Filbert, if you will confine yourself to one; but perhaps you can add the red Filbert and the Cosford nut. The latter has such a thin shell that people find it does not obdurately protect the kernel, even in the absence of any but enamelled crackers.‖

Grapes: *Hertfordiensis.* Excess of moisture *somewhere* is the cause; it may be in the soil, or in the air, or in both. If you have not full circulation of air, that at once explains the mischief.‡

Heating: *Palmata.* We do not at all understand your meaning. This however is certain, that your pipes are full of air, that your expansion cistern is too small, and that pipes should not drop, but *rise*, from the boiler to the other end.

Ice-houses: *Sub.* Many plans have been given in our earlier volumes, as will be seen by referring to the list of woodcuts published with each volume.‡

Insects: *Stuck in the Mud.* 1, Porthesia chrysorrhea (the gold tail moth); 2, Chrysomela Polygoni; 3, Males of a species of pimpla, a genus of parasitic Ichneumon-flies, the larvæ of which were reared within the bodies of some of the Yponomeuta caterpillars, as is the habit of the Ichneumonidæ; 4, Microgaster glomeratus, another parasitic Ichneumon; 5, we suppose these are also the cocoons of some Ichneumon; 6, Ophioglossum. *W.—Mary.* The grubs sent are the young larvæ of the common cockchaffer, which are injurious to Grass and other plants. The Pea pods and Pear leaves have not been attacked by insects. *W.—C R.* The grubs on the Pear leaves are the slimy larvæ of the black-winged saw fly (Selandria æthiops). When full-grown they descend into the earth to undergo their changes. Powder the leaves with lime, or wash them repeatedly with lime water. *W.—Bergamot.* The Pear leaves sent are blistered by the very minute larvæ of a little moth (Argyromiges scitella, or Clerckella of some authors) which feed *within* and not upon the surface of the leaves. The leaves affected should be picked off and burnt. *W.*

Mildew: *J S.* The Potato-leaf was bruised and unexaminable. We could discover nothing on the Vine leaf; the other leaves are affected by the Grape or Egg Mildew (Oidium Tuckeri).‡

Music: *Hannah.* We make a point of not answering any questions which do not relate to natural history or rural œconomy. As to music we could not distinguish a "Reveillé" from a waltz; and have no information whatever about it.

Names of Plants: *Erzeroum.* 152, Scorzonera; 35, Scorzonera tuberosa; 101, S. stenocephela, *Boissier;* 291, Asterothrix asperrima.—*P Mackenzie.* Luzula pilosa.—*S P S.* Smyrnium Olusatrum.—*G T.* Its proper name is Nonesuch or Black Medic (Medicago lupulina).—*J G.* Astrantia major.—*Young Gardener.* Some Rush in a monstrous state. Its name cannot be ascertained unless you can find it in its natural condition. It may be a state of the Toad Rush.—*Spero, Aberdeen.* No doubt it is the Testudinaria elephantipes, a plant of the order of Yams. It is a greenhouse climber.—*J H.* The kind of abnormal development exhibited by your specimen is of frequent occurrence amongst Ferns. The curled (?) forms of Scolopendrium officinarum are familiar examples, but why a solitary plant of a species occasionally shows it we cannot explain. When we speak of Ferns we do not confine our views to the 40 or 50 species natives of Britain, but we form our opinions from our knowledge of the Ferns of the world, of which there are about 2000 species. *S.*

Palm Trees: *Sub.* They will succeed in a large conservatory, planted out in the bed, which is all fresh soil, an excellent mixture of peat, leaf-mould, and sandy loam, and where the conservatory is lofty and warm.‡

Pansies: *P M.* A Pansy is considered a seedling until it is "sent out." But whether or not a two-year-old seedling will be allowed to compete with yearlings depends on the rules of the show. The practice at the leading London exhibitions is this, "That there shall not be less than three blooms of each variety, without reference to age, so long as they are not out." There are, however, many objections to showing yearlings.*

Peas: *J and E Allen.* Your Pea is a long, nearly straight-podded green marrow, containing 7—8 Peas. It resembles a sort called Ne plus ultra.‖—*Inquirer.* Hairs's Mammoth.‖—*Hardy and Son.* Appears to possess the properties of Knight's Tall Green Marrow.‖—*J M.* Your Pea which grows in the form of a shrub with thick stems, that need no support, is the American Crown Pea, described in the Transactions of the Horticultural Society many years ago.‡

Pomegranate: *G S.* Prune the roots now. Let the shoots alone, or only stop the strongest.

Potatoes: *J F.* We cannot offer any opinion upon seedlings.‡

Pot Pourri: *G B.* Put into a large China jar the following ingredients, in layers, with salt strewed between the layers; 2 pecks of Roses, part in buds and part blown, Violets, Orange-flowers, Jasmine, and anything sweet, a handful each; Orris-root, sliced, Benjamin and Storac, 2 oz. of each; ½ oz. of musk, ½ lb. of Angelica-root, sliced, a quart of the red parts of Clove, Gillyflowers, two handfuls of Lavender-flowers, half a handful of Rosemary flowers, Bay and Laurel leaves, half a handful each; also of knotted Marjoram, and Balm of Gilead. Cover them quite close; when the lid is removed the perfume is very fine. When the above has been in the jar some weeks, it is advisable to empty it entirely; stir it well with the hand, and return it into the jar again.‡

Puzzle: *E F G.* You have missed the point altogether.

Raspberries: *Sub.* Now that the fruit is gathered, you may give them more air and sun between the rows or stools, by removing the shoots on which this year's fruit was produced, and leaving none but young canes.‡

Strawberries: *Anon.* Very like the Comte de Paris.‖—*J M.* Cuthill's Black Prince for an early, and Elton for a late crop.‡

Tar: *Juvenis, Cork.* Gas tar will not hurt your wood, quite the contrary; but its smell is very likely to kill any plants that are in frames coated with it.

Turf-soil: *Sub.* Baking in an oven, or saturating with boiling water will kill the grubs in it.‡

Water Melon: *G B.* Grow it like other Melons.

Misc: *R S.* It is too late to prune Azaleas now, it should have been done immediately after they had flowered. The same remark applies to Epacrises and Heaths. Fuchsias may be pruned in spring. You will find some account of mildew in another column. Your Camellias will be best out of doors for some time yet. See that they do not suffer from drought.‡

SEEDLING FLOWERS.

Calceolaria: *T R P.* Quite shrivelled up when received.*

Double Sweet William: *B G.* Not in an examinable state when received.*

Petunias: *C C G.* Pretty, but no improvement on kinds already in cultivation.*

Picotee: *W D.* Too rough in the edges to please florists now-a-days.*

*** As usual, many communications have been received too late, and others are unavoidably detained till the necessary inquiries can be made. We must also beg for the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

PERUVIAN GUANO.—As Agents of the Peruvian Government for the importation and sale of this valuable MANURE, we think it right, for the protection of consumers and respectable dealers, to apprise them that the adulteration of the article is still extensively practised, and to recommend them to apply either to ourselves, to our agents, Messrs. GIBBS, BRIGHT, and Co., of Liverpool and Bristol, or to dealers of established character, in whose honesty and fair dealing they can place implicit confidence. ANTONY GIBBS and SONS.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

Corn and Grass Manure, per ton	...	...	£10 0 0
Clover Manure, do.	...	...	11 0 0
Turnip Manure, do.	...	...	7 0 0
Superphosphate of Lime	...	...	7 0 0
Sulphuric Acid and Coprolites	...	...	5 0 0

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 15*s.* per ton; and for 5 tons or more, 9*l.* 10*s.* per ton, in dock. Sulphate of Ammonia, &c.

CORN MANURE FOR WHEAT, BARLEY, OATS, BEANS, &c. &c.

THE LONDON MANURE COMPANY most confidently recommend the above, as tney are daily receiving very satisfactory accounts from parties who used it with great success last season. It will be found fully equal to and much cheaper than Peruvian Guano, and is not so liable to produce so large a growth of straw. Price Seven Guineas per ton, 3 cwt. per acre. They also beg to offer their Concentrated Urate, Superphosphate Lime, Nitrate of Soda, Sulphate and Phosphate of Ammonia, Fishery and other Salt, Gypsum, Sulphuric Acid, and genuine Peruvian Guano. To insure this free from adulteration, all purchasers can receive it direct from the Warehouses of the Importer.

Bridge-street, Blackfriars. EDWARD PURSER, Secretary.
Country Dealers and Agents supplied.

FOR WATERING GARDENS, BREWERS' USE, &c.
FLEXIBLE INDIA-RUBBER HOSE PIPES.

JAMES LYNE HANCOCK, Sole Licensee and Manufacturer of the PATENT VULCANISED INDIA-RUBBER PIPES and TUBING.

These Pipes are well adapted for Watering Gardens, conveying Liquid Manure, racking Beer and Cider, Gas Fittings, Chemical and all purposes where a perfectly sound WATERPROOF and FLEXIBLE PIPE is required.

Hot Liquors or Acids do not injure them. No oil or dressing is required in using them. They do not leak from remaining out of use, are permanently Flexible in all Temperatures, and are therefore particularly suitable for Fire Engines; and, from their not leaking, are found exceedingly useful in conveying hot or cold water to baths in dwelling houses and such like purposes.

A LIGHT VULCANISED INDIA-RUBBER HOSE is now manufactured for conducting Water and Fluids, at the following prices per foot:

Size.	½ in.	⅝ in.	¾ in.	1 in.	1½ in.	2 in.	2½ in.	3 in.
1 ply ...	0*s.* 5*d.*	0*s.* 6*d*	0*s.* 8*d.*	0*s* 10*d.*	1*s.* 0*d.*	1*s.* 2*d.*	1*s.* 4*d.*	1*s.* 6*d.*
2 ply ...	0 8	0 9	1 0	1 2	1 5	1 8	2 0	2 3
3 ply ...	0 11	1 0	1 3	1 6	1 10	2 2	2 9	3 3

N.B. Vulcanised India-Rubber Garden Hose fitted with roses, jets, and branches, complete, with union joints ready to attach to pumps or water cisterns.

All orders or letters addressed to J. L. HANCOCK, at the Manufactory (and Warehouse), Goswell-mews, Goswell-road, London, will meet with immediate attention.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

EDENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses, when completed charged, from 1*s.* 3*d.* to 1*s.* 6*d.* per superficial foot, according to size and quantity; on one principle the roof is formed without wood or putty, and on another principle with wood rafters, and the glass put in with putty. Patent Sashes, requiring no paint, from 7*d.* to 9*d.* per foot. HEATING BY HOT WATER.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

F. M'NEILL AND Co., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of THE ASPHALTED FELT FOR ROOFING Houses, Farm Buildings, Shedding, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained TWO SILVER MEDAL PRIZES, and is the Felt SOLELY patronised and adopted by

HER MAJESTY'S WOODS AND FORESTS,
HONOURABLE BOARD OF ORDNANCE,
HONOURABLE EAST INDIA COMPANY,
HONOURABLE COMMISSIONERS OF CUSTOMS,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANIC GARDENS, REGENT'S PARK,

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the ROYAL AGRICULTURAL SOCIETY'S HOUSE, Hanover-square.

It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

PRICE ONE PENNY PER SQUARE FOOT.

*** Samples, with Directions for its Use, and Testimonials of seven years' experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.

☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are

F. M'NEILL AND CO.'S

Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where roofs covered with the Felt may be seen.

The new Vice-Chancellor's Courts, at the entrance to Westminster Hall, were roofed with F. M'NEILL and Co.'s Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.

NOTE.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

LIGHT, CHEAP, AND DURABLE ROOFING.

CROGGON'S PATENT ASPHALTE ROOFING FELT is perfectly impervious to rain, snow, and frost, and has been tested by a long and extensive experience in all climates. Saves half the timber required for slates; can be laid on with great facility by farm servants, or unpractised persons. Price 1*d.* per square foot.

CROGGON'S PATENT NON-CONDUCTING FELT, for Steam Boilers and Pipes, saves 25 per cent. of fuel.

Samples and Testimonials sent by post, on application to CROGGON and Co., 2, Dowgate-hill, London.

The Agricultural Gazette.

SATURDAY, AUGUST 3, 1850.

MEETINGS FOR THE FOLLOWING WEEK.

WEDNESDAY, Aug. 7—Agricultural Society of England.
THURSDAY, — 8—Agricultural Imp. Society of Ireland.

WE have great pleasure in pointing out an instance, in a recent number of the "Journal of Agriculture," of the benefits to be derived from FARMERS' CLUBS. Farmers, as a body of men, are proverbially unwilling to express their opinions in public; and though possessed of a fund of knowledge, valuable both to the community and themselves, it has only been by means of social agricultural societies and farmers' clubs that much of this information has been gathered together, and rendered available. In this instance we allude to a report, drawn up and published by a committee of the Annandale Farmers' Club, on the "Manures most Suitable for the Turnip Crop." For the purpose of preparing the report, the committee inspected about 80 crops of Turnips, grown on 34 farms. The report gives the time of sowing in most instances, the distance between the drills, the distance between the Turnips, weight of crop per acre, and manure (whether farm-yard, guano, bones, or superphosphate). Upon this last point the information contained in the report is very important. It is found that, wherever a portion of artificial manure is used along with farm-yard manure, the crop is better than where a larger quantity of the latter is used alone. The committee found that as much as 35*s.* per acre, expended in purchased manures, along with about 15 loads of dung, is what *ought* to be applied over the whole green crop of the farm.

The middle of the month of May is found for that part of Scotland to be the very best possible time for sowing Swedes, and the committee recommend that a portion of white Turnips be sown at the same time, the latter being especially valuable on many farms, for giving to cattle at the end of September and beginning of October. The average width of drill is about 28 inches, and the distance between the Turnips about 7 inches, though one very successful grower recommends 14 inches.

We do not see that any inquiry has been made by the committee as to the comparative merits of drilled or broadcast Turnips. This seems to be a subject quite settled in favour of the former in the mind of the Scotch farmers; and one motive for noticing this report is to direct attention to the common plan of growing Turnips in many of the southern counties. We remember to have noticed in Hampshire, a few years ago, that drilled Turnips were quite the exception to the rule. The plan there adopted is also to apply the farm-yard manure upon the Clover lea for Wheat, the Turnips immediately following getting little or nothing except bones or guano—and what would have been still more striking to the eye of a Scotch farmer, nearly the whole of them were sown broadcast. Caution must be used in finding fault with the practice of any district, but before we can be satisfied that a plan, opposed to the custom of the best Turnip growing portion of the kingdom, is the best adapted to that district, very clear and cogent reasons must be assigned. If no other advantage could be pointed out than the greater facility for horse-hoeing afforded by the drilled, over the broadcast Turnips, it alone would satisfy our minds of the superior advantage of the north country system. So perfectly satisfied are our northern brethren on this point, that during a recent visit through the north of England, and the south of Scotland, we did not observe one field of Turnips sown broadcast. If it be an advantage to have the Turnips on the level surface in the southern counties, as it has been asserted, this can be easily managed by drilling the Turnip seed upon the flat, numerous drill-machines for this purpose being now in existence.

Such reports and examinations as that which has led to these remarks, would not only be the means of determining the best method for cultivating Turnips in particular districts, but many anomalies attending a more limited series of experiments on a single farm would also be cleared up. Let any one examine the experiments quoted in the first edition of JOHNSTON'S "Agricultural Chemistry," and he will be at once satisfied that since that time agricultural chemistry has made very striking progress. But still there is a great deal to be done. As a proof of the advantage which an examination over a wide district presents over a more limited opportunity for investigation, we quote the following results of two series of experiments undertaken to ascertain the best manures for the Turnip crop,—precisely the object sought by the Annandale Farmers' Club.

	Experiment No. 1.		Experiment No. 2.
1, Farm-yard manure	Good crop	...	The worst.
2, Farm-yard manure, with guano	Good crop	...	Better than farm-yard manure alone, but still poor.
3, Farm-yard manure with bone-dust	Very fair	...	The worst result of the series.
4, Bone dust	Not tried	...	Very good.
5, Peruvian guano ...	Fair ...	...	Very good.
6, Prepared bone-manure	Ditto ...	...	The best crop of the series.

(*From the report of the Derwent and Shotley Bridge Agric. Society.*)

It is obviously impossible to extract the slightest benefit from such a series of contradictory results as these. Neither does the report of the experiments furnish us with any clue to their elucidation. Unlike the examination conducted by the Annandale Farmers' Club, such a series of experiments only raises difficulties; it settles none.

Without undervaluing individual exertions, the example we have quoted is well worthy of imitation. There are now few districts without a farmers' club, and we see no method by which these local societies can more effectually aid the improvement of agriculture in their own neighbourhoods than by undertaking an inspection similar to that carried out by the Annandale club.

Turnips are the best crops on which to attempt such comparisons. Good management and skilful manuring are more on a par in the case of Turnips than in grain crops; besides they are now the basis of good farming, a good crop of Turnips being a certain proof of good general management.

WE have it in our power to state that a company has been formed to carry into operation the "GENERAL LAND DRAINAGE AND IMPROVEMENT ACT" of last session. It is well supported by the leading agriculturists of the day, and several influential capitalists and contractors are among its members. The company contemplate the erection of farm homesteads, the under-draining of land, the execution of works for the sewerage of towns, with a view to the conservation of the sewage for agriculture; the enclosing of open and uncultivated land, which they have the power of purchasing, disentailing, and reselling; the irrigating and warping of land, and other works of improvement which the lack of capital or the limited interests of tenants for life now prevent, but which this company may carry out and charge the inheritance with the cost, by dividing the amount into instalments, repayable in the case of buildings within 31 *years*, and in the case of land improvements within 50 *years*.

ON HARVESTING WHEAT.

THERE are still many and various opinions regarding the best method of cutting and harvesting Wheat. With a view to invite a discussion, so as to elicit the truth, we would give our own experience of the matter. There are first the various methods of reaping—high up the corn, to have as little straw as possible; reaping low, to have it almost all; "bagging," to cut up everything close to the ground (weeds not excepted, though there be any); and mowing, which also aims at making clean and quick work of everything. Then comes the difference of expense of the various methods of cutting down. For a considerable distance on all sides of us the relative prices for reaping, bagging, or mowing, have run thus: 10*s.* an acre for reaping or bagging low, 8*s.* for reaping high, and 7*s.* 6*d.* per acre for mowing. Mowing is therefore, in the first instance, cheaper than any other system. Then comes the carting of the corn. For all ordinary cases, which have come under our notice, one man could pitch from 10 to 12 acres of Wheat sheaves in a day, if reaped high, and from 5 to 6 acres only, if cut low. In connection with the one man pitching there is generally a leader and three or four men stacking, not to mention boys driving or leading. The common wages of a harvest man is 3*s.* a day. Upon the presumption, then, that the above statement is correct, 6 acres of mown Wheat will cost as much for carriage as 12 acres of reaped; or, reckoning it in money, six men at 3*s.* a day = 18*s.*, while 12 acres of reaped could be carried at the same cost, leaving a difference

in favour of the reaped Wheat of 3*s.* per acre. Next comes the thatching, which, if all the corn and straw is stacked together at harvest, requires immediate covering when wages are double that of other times. A stack of corn—of mown corn, of six acres—has in general about 1000 square feet of thatching upon it, at a cost of 10*s.* for laying on; a stack of reaped Wheat (presuming all along that the reaped is about half the bulk of the mowed) would cost but 10*s.*, while it contained double the number of acres. On the score of thatching, then, there is 5*s.* per acre in favour of the reaped. If the haulm or stubble requires thatching, it may be done at half the rate of harvest wages; so that, although in amount of quantity there would be as much thatching of corn and stubble separately, yet the cost would be relatively the same as above per acre.

But the chief advantage of reaped Wheat over mown lies in the threshing, whether by hand or by machinery. We lately saw a steam-engine of eight horse power threshing mown Wheat with straw of about 7 feet long. It was all the engine could do, to draw in half a sheaf at a time from one man feeding. Another time the engine was threshing reaped Wheat with short straw, when two men were fully employed to feed the machine, which was going easily, without any strain upon the engine or machinery. In the case of the mown Wheat, 30 quarters per day, of 10 hours, was with difficulty threshed; on the other hand, 8 quarters per hour was the rate of speed with the short sheaves, which was more than double as fast. The cost of threshing the reaped Wheat, including fire, labour, and interest of engine and machinery, was only 8*d.* per quarter. The cost of threshing the long Wheat was about 20*d.* per quarter. Allowing an average crop of Wheat at 4 qrs. per acre, we have then a saving in threshing reaped Wheat of 4*s.* per acre. I remarked to the bailiff on the farm where the threshing was going on, "What do you think of mown Wheat, now?" He said, "God bless ye, the engine can scarcely draw it through, and I thought we never should have carted the corn from the field at harvest; we wanted as many men carrying nearly as cutting down."

In threshing with a locomotive engine here lately, the advantage in threshing Wheat with little straw was very apparent over the long sheaves. By water and by flail we have ever found it the same, and after abandoning the old-fashioned plan of reaping, and turning to mowing and bagging, we cannot but be reconverted that reaping Wheat in all ordinary circumstances is more economical than mowing. But, moreover, in addition to what has been said about the relative cost of the two plans, there is another expense in taking in to thresh of double on long sheaves per acre as short; there is also a deal of straw to be removed in general a long way from the barn, to where it is required; whereas, if the premises are not very concentrated, a stack of stubble may be taken from the field and set upon the spot at once for daily use. A common objection by the advocates of mowing Wheat against reaping is, that the ground has to be gone twice over. This is, however, a very trivial objection, as the difference of expense of the two plans before the corn is stacked is more than sufficient to cut down the stubble and cart it home immediately after harvest. The advocates of mowing say—and say truly—that mown Wheat will always be ready a day or two sooner for carting than reaped Wheat after rain; but on the other hand, the reaped corn sustains the least injury by sprouting in the bottom of the sheaf. Corn merchants can immediately detect mown Wheat by soft kernels and pieces of dirt, &c., mixed with the sample, so that there is really a disadvantage in mown Wheat on that score. Very often may be seen half the sheaves of a mown field lying on their sides in a storm of wind and rain, when short, compact, reaped sheaves stand erect free from danger. Where there are weeds—especially many—mowing is quite out of the question, as the seeds are carried home and re-carried to the land again with the manure. If there are a few Thistles and Docks, &c., they can be left after the sickle, pulled up, and burned.

There must of course, as in every other case, a deal depend upon circumstances which is the best method of the two—reaping or mowing. We would say, then, short clean corn would be more economically mowed than reaped, if good mowers are to be found. But that reaping is to be preferred for all long thick crops, whether clean or not. We put the saving of carriage of reaped Wheat in harvest against stubble cutting and carriage after harvest; in all cases we wish to be understood that the stubble should be cut either in part during wet days in harvest, or immediately after it. The first item to the credit of reaped Wheat, then, is 5*s.* per acre for thatching. The next would be the extra cost of taking the corn into a barn, which would be in times of common wages 1*s.* 6*d.* per acre. The next item is 4*s.* per acre on the score of threshing, even with the most approved machinery; and where the straw has to be carted from the barn to scattered premises, there ought to be a charge there. We shall, however, just add the thatching, taking in, and threshing together, which amounts to 5*s.* 11*d.* per acre in favour of reaping. We have heard it contended, by-the-bye, that you get all the corn by mowing and raking; that appears correct by looking at the ground just raked between the shocks, but we never yet saw great, long, unwieldy sheaves but littered very much at the time of carrying, and left more for the gleaners than ordinarily reaped Wheat. There can, however, be no decided rule in every case as regards the two plans, and many persons might do well to consider their individual cases before adopting new plans, or clinging obstinately to old ones. We have heard so much on the matter of the above, that we have been led on to a greater length than was at first intended; at the same time, we would very much like some of those scythians to show us some reason why the old school in this respect is not better than the new. *R. V., Leighton Buzzard.*

MANURING FOR EVERY CROP.

With reference to your leading article, at page 473, I pass by the remarks upon the necessity for long leases given to tenants of sufficient capital, energy, and skill; they are self-evident, and of course commend themselves to every unprejudiced person's unqualified approbation. But your observations upon artificial manures are so intimately connected with my own practical farming, that I cannot refrain from addressing you a few lines; and chiefly because the arable land under my cultivation has received nothing but artificial manures during the last 30 years at least, and probably for a much longer period. My arable farm is therefore a remarkable instance, possibly an unique one, of very ordinary land in its natural state, producing heavy crops, and every year increasing in fertility, without the aid of a cart-load of dung, during the memory of man.

Like Mr. Hudson I manure for every crop; and although I have not a long lease, yet I have the still greater advantage of farming my own land, and therefore do just what I please. My land is of every description, from a very stiff clay to a light gravelly sand. It runs from the plastic clay above the chalk to the lower green sand below it.

I might, perhaps, be asked, what I do with my farm-yard dung, as I make such large quantities every year? It is always applied to my Hop-grounds, each of which receives a heavy dressing once in three years, and the two succeeding years it is manured with various other substances. And I may here add, by the way, that my experimental Hop-grounds already indicate that my practice has hitherto been correct. But to return to my common farming operations; for many years, and till the introduction of guano, and the use of ammoniacal salts, I was compelled to employ rags, shoddy, hair, rape-cake, bones, &c., for my Wheat and Turnip crops. These are slowly decomposing manures, and as a consequence I was dependent entirely upon the seasons for success. But now the case is wholly different; for, thanks to the introduction of guano and the discovery of an easy process of making superphosphate of lime, the crops, under Providence, are in great measure subject to our own control, and we can ensure a heavy crop of Turnips, or of the cereals; that is, provided the latter will stand up. You may, perhaps, tell me that my farm is situated under peculiarly favourable circumstances. But it is not so: for although our best Hop-land is probably the finest soil in the kingdom, our parish would successfully compete in producing the very worst arable land in its natural state. My own arable land, too, is of a very ordinary description.

As regards the Turnip crop, I think my success is complete; for I usually grow as many as the ground can hold, and it is not an uncommon thing to have Swedes weighing 15 to 20 lbs. each. Here I sow 3 cwt. per acre of Peruvian guano broadcast, and drill with the seed 4 or 5 cwt. of my home-made superphosphate. The phosphate, I need not remind you, I dig in abundance, so also might many others if they chose, and generally pull off half my Swedes, the remainder being fed off by sheep—that is, on my light soils, and the sheep have an allowance of 1 lb. of oilcake each per diem, with hay or Pea-haulm. This process ensures a good subsequent crop of Barley or Oats, if the heavy summer showers do not lay them flat. Yet I invariably obtain as good or better crops if I pull all my Swedes, and manure my corn with ammoniacal preparations.

I may here incidentally remark that I marl my ground whenever I think such an interchange of soil is required, and that I plough all my land very deeply, with an occasional sub-soiling. To this I attribute much of my success in growing large crops on what had hitherto been considered poor ground. But I have been chiefly induced to write to you on this subject from the doubts which you throw upon the applicability of the "artificial manuring principle" to the cereals. I should have thought that Mr. Lawes' invaluable experiments had decided this question. For in his experimental Wheat field, after four years' exhaustion of the soil by various crops without any manure, we see plots dependent entirely upon the application of ammonia which produce seven crops of Wheat in succession averaging nearly 40 bushels per acre. What more satisfactory evidence of the applicability of the artificial manuring system to the cereal crops can we require?

My own experience will only tend to corroborate these "landmarks" of agriculture in a small degree; yet when I tell you that my Wheat crop last year averaged about 44 bushels per acre upon very middling land; that I obtained 64 bushels of Barley after pulling off all my Turnips; and that my Oat crop averaged nearly 100 bushels per acre. I think I may assert that the artificial manuring system is not to be despised. And I may also here remark, that on a field of the upper chalk proverbially poor, and where I was told I could not grow a crop of Wheat, by the application of 1½ cwt. of the sulphate of ammonia, and 2 cwt. of Peruvian guano mixed with my ground up fossil phosphates, I grew last year upwards of 7 qrs. of Wheat per acre. This year my Wheat and Barley are nearly all laid by the heavy rains; but I have a field of Oats of 20 acres upon a very poor soil, which had they not been laid by the rains, I feel persuaded would have averaged a crop of full 14 or 15 qrs. per acre.

I shall not be accused of vanity when I say that my crops are superior to any in this parish, with the exception of one neighbour, who avowedly follows in my steps. What we now want is a cheap source of ammonia. Cannot you stir up the agricultural chemists, so that they may obtain for us the ammoniacal salts of a cheaper rate than we buy them in guano? But if this cannot be effected, the farmers of England have abundant cause to be thankful for the introduction of guano; and they may rest assured that guano without protection is infinitely better than protection without guano. *J. M. Paine, Farnham.*

THE KIRKLEAVINGTON HERD OF SHORT-HORN CATTLE.

The sale of this celebrated herd took place on Thursday, May 9, 1850, in presence of a company, which, at the lowest estimate, could not be less than 5000 persons, including nearly every breeder of short-horn cattle of note in the United Kingdom, as also breeders from the continent of Europe, and from the United States of America. It may with confidence be maintained that on no similar occasion has so great an interest been excited amongst the breeders of this variety of the ox, so justly the pride of our country, as on that referred to above: and well, indeed, did the herd deserve the far extended fame which attracted such a mighty gathering on the occasion of its dispersion, to be the *nuclei* of new, or to enrich collections already in being, in our sea-girt isles, in Europe, and in the great western quarter of our planet, beyond the Atlantic ocean.

To criticise in print a herd whilst it remains the property of the breeder is obviously an improper intermeddling with private property, by which no good purpose can be answered, but which may be productive of controversy, liable to excite vexation. When, however, a herd is dispersed, as on the occasion under consideration, the reason for withholding an opinion of its merits, and of those of the several animals of which it is comprised, ceases: in fact, an event in the annals of rural affairs of such interest and importance as the sale of the Kirkleavington herd, not only demands a more permanent record than the ordinary notice in the columns of a newspaper, but now that the cattle in question no longer form a distinct herd, a monument of the incident becomes useful; and no repository for such can be so fitting as the pages of the "Farmer's Magazine."

The herd in question, comprising 48 cows, heifers, and heifer-calves, and 20 bulls and bull calves, late the property of Thomas Bates, Esq., formerly of Halton Castle, afterwards of Ridley Hall, both in Northumberland, and lastly of Kirkleavington, near Yarm, in Yorkshire, displayed an eminence in every point of excellence, which has been very rarely attained.* In a combination of those qualities which constitute excellence, in the short-horn variety of cattle, it may be asserted with confidence, that the Kirkleavington herd at the time of its dispersion was unequalled by any other in existence. Magnificent size, straight and broad back, arched and well spread ribs, wide bosom, snug shoulder, clean neck, light feet, small head, prominent and bright but placid eye, were features of usefulness and beauty which distinguished this herd in the very highest degree; whilst the hide is sufficiently thick to indicate an excellent constitution, its elasticity when felt between the fingers and thumb, and its floating under the hand upon the cellular texture beneath, together with the soft and furry texture of the coat, evinced in an extraordinary degree throughout the herd excellent quality of flesh, and disposition to rapid taking-on fat. In the 68 head of cattle, not one could be characterised as inferior or even as mediocre—all ranking as first-class animals; and when an idea of inferiority arose, it was only in reference to a comparison with some of this splendid herd, which, from their most extraordinary excellence, may demand special notice.

The herd consisted of six families:—The Duchess, the Oxford, the Waterloo, the Cambridge Rose, the Wild Eyes, and the Foggathorpe, which are here enumerated in succession according to the prices which each realised at the sale; a synopsis of the pedigrees, prices, and purchasers, being subjoined, to which it will be sufficient to refer for such particulars.

Of the Duchess family, which originated with Young Duchess, a two-years old heifer, got by Comet, dam by Favourite, and purchased by Mr. Bates at Mr. Charles Colling's sale in 1810 for 183 guineas, were four cows, three heifers, one heifer calf, four bulls, and two bull-calves; the first of which that demands especial notice is the Fourth Duke of York. This animal, now the property of Earl Ducie, is the *beau ideal* of bovine excellence.† His magnificent size, and perfection in every point of excellence, entitle him to be considered as the brightest gem of the herd; and if not the very best bull in existence, he certainly cannot be surpassed. Grand Duke, Duchess 54th, and Duchesses 55th, 59th, 61st, 62d, and 64th, all of the same family, are the finest imaginable specimens of the short-horn tribe. Next in order is the Oxford family, consisting of four

* A memoir of Mr. Bates was published in the "Farmer's Magazine" for January, 1850, with a portrait of that gentleman.

† As a proof of this remark, and what may be expected from his produce, we beg to observe that the only three calves got by him realised the sum of 379*l.* 1*s.*, or 126*l.* 7*s.* each. [*Ed. Far. Mag.*]

cows, two heifers, four heifer calves, and three bulls, of which Oxford 6th, Oxford 11th, and Second Duke of Oxford, are all animals of extraordinary excellence. The Waterloo and Cambridge Rose families were less numerous than the two preceding. The whole of the animals composing them possessed great excellence, although inferior to those previously noticed. The Wild Eyes, the most extensive family in the herd, consisting of 25 head, in which were nine cows, seven heifers, two heifer calves, four bulls, and three bull calves; and of which Balco, a remarkably fine yearling bull, and two three-year-old heifers, Wild Eyes 22d and 23d, were prominent lots in the sale. The only remaining family now to be mentioned is the Foggathorpe, descended from a cow of that name, bought by Mr. Bates, for which he gave 100 guineas when she was of so advanced an age as not to be likely to breed. This family comprised two cows, one heifer calf, and four bulls; of which Ebor, a yearling, sold for 90 guineas.

The sale of this extraordinary herd realised a total amount of 4558*l.* 1*s.*; and, great as this sum may seem, it is not in any degree extravagant to suppose that had the identical animals been in existence in 1839, and put up for sale after Mr. Bates's unparalleled triumph as a breeder of short-horns at the show of the Royal Agricultural Society of England at Oxford, in obtaining four principal prizes with the only four animals entered by him on that occasion, the 68 head of cattle would then have realised double the sum they did on the 9th inst. In support of this opinion the writer can state upon undoubted authority, that so great was the estimation in which the premium animals referred to were held, that an offer of 400 guineas each for the premium cow and heifers was refused; and that for the bull, Duke of Northumberland, Mr. Bates might have had almost any sum he might have asked; but he considered the animal valuable above all price. When the circumstances of the great yearly increase and diffusion of short-horns of the very first class in every part of the kingdom for many years past, and the crushing influence which free-trade policy must have on the price of cattle, are considered, the proceeds of Mr. Bates's herd fully corroborates the writer's opinion of its being the most excellent ever submitted for sale by auction.

In conclusion it may be observed that the arrangements of this great sale reflect the highest credit on Mr. Chrisp, who represented the owner of the stock; and that the perfect knowledge of the subject, the great professional ability, and the gentlemanly demeanour of Mr. Strafford as auctioneer were universally the theme of the highest praise; and that gentleman may be assured that he has won the admiration of those short-horn breeders of the northern part of the kingdom who had not previously an opportunity of becoming acquainted with his professional qualifications. *Newcastle-upon-Tyne, May* 16, 1850.

From the Farmers' Magazine of June, 1850.

MANAGEMENT OF AN ALLOTMENT.

THE following is an outline of the way in which an allotment may be cultivated to the best advantage. Rotation for a cottage allotment of half a statute acre, on a brown loamy soil:

12 rods—Early Potatoes, with 2½ tons of dung. Swedish Turnips the same year planted.
12 rods—Mangold Wurzel the second year.
12 rods—Beans, Peas, Vetches third year. Turnips, Rape, Kale and Broccoli, may follow the same year.
12 rods—Late Potatoes fourth year, with 2½ tons of dung.
12 rods—Cabbages, fifth year, planted 15 inches asunder every way. Every alternate row with early varieties. The other row, every alternate plant early and late Cabbage.
12 rods—Wheat sixth year.
8 rods—For seed beds and other plants.

80 poles.

THE SAME ROTATION MORE SIMPLE:—1st, one third of the land Potatoes. One half early ones, and one half late, with 4½ tons of dung. 2d, Mangold Wurzel and Cabbage, one half of each. 3d, half Beans, Peas, Vetches, Rape, Broccoli, &c., and half Wheat. Swedish Turnips would be second crops after early Potatoes. Rape, &c., would come after Beans, Peas, and Vetches. Upon peaty and moss soils, I would exclude the Wheat and Vetches, and more Potatoes might be introduced, as those soils are more suitable for Potatoes than for Wheat. In the autumn of every year, the Wheat and Vetches should be sown, 12 rods of the former, and 4 of the latter. The remainder of the land to be dug over deep, in the autumn and winter, as the crops are removed, in order to prepare the land for next year's crops, and to receive the benefit of frost, &c., in winter.

The 12 rods for early Potatoes I should recommend to be trenched in the autumn, 15 inches deep. By following this rule, the whole allotment will be trenched every six years. In the first open weather in February sow the Beans and Peas in rows, covering the seed 6 inches deep with soil, leaving it in a ridge. When the seed has sprouted about half way through, or less, rake 3 inches of the soil off the ridges; the crop will soon be above ground, and quite clear from weeds. When the crop is about 4 or 6 inches above ground, hoe a little soil to each side of the rows, and then delve the soil up in the intervals between each row of Beans and Peas. Then plant a row of late or Savoy Cabbages in each interval. These will come forward as a crop after the Beans and Peas are removed. Late Potatoes, or Turnips, might be planted at intervals, but they would require dung. Keep all these crops clear of weeds by hoeing and weeding; and when the Beans and Peas are all gathered, remove the stalks or hulls to the dung-heap, and dig the ground over. This will give air, and accelerate the growth of the Cabbage, &c.

In the first dry weather in March, plant the early Potatoes, giving 2½ tons of dung to the 12 rods. Keep them clean, and as the crop is gathered ready for the market, or use, plant Swedish Turnips, or sow yellow ones. Swedes are far superior for pigs. In this month, make a seed bed; sow Swedish Turnips, Rape, Kale, and Broccoli, for transplanting. When these are above ground, weed the plants out to 3 inches asunder; they will then become strong, if kept clean by hoeing with a 2-inch hoe, and by weeding.

In the first dry weather in April, plant the late Potatoes for winter use, in rows, giving the 12 rods 2½ tons of dung. Keep this crop clean by digging, hoeing, and weeding. Towards the latter end of this month, or the beginning of May, sow the Mangold Wurzel, in rows, 27 inches asunder. Thin out the plants 10 or 12 inches asunder in the row, when they are in the fourth leaf, and dig the intervals once a month during the summer.

In June the winter Vetches will be cut, and as the crop is removed, dig the land, and plant Kale, Rape, Broccoli, late Potatoes, or Swedish Turnips; or sow common ones, for second crops. Keep them clean by hoeing and weeding. In the autumn, when the late Potatoes are got up and stored, dig the ground, and plant Cabbages in the following manner. First, plant late ones, in rows, 30 inches asunder, and the plants 30 inches asunder in the rows. Then plant an early York between each of these, in the same row. Then plant a row of early Yorks, Nailors, or Sugar-loaves, between every row of the above, at 15 inches asunder in the row. This will leave the plants 15 inches asunder every way upon the ground, and one fourth of the plants will be late ones. In the first dry weather in spring, hoe well between the plants; and fill up with fresh plants all those places where the plants are dead.

As the early varieties become ready for cutting, remove them; dig the ground, and hoe the soil up to the plants of the late Cabbages, which will then soon cover the ground. If any of the late ones should fail through disease, or any other circumstance, remove them, and plant a Swedish Turnip, or Kale, &c., in the place thereof. The late Cabbages may be taken up in November and stored for use, when the Wheat crop may be sown upon the land after it has been dug. To store Cabbages place them in a dry room or shed, or airy place out of doors; lay them in layers the wrong side down. If out of doors, bring the heap to a ridge, and cover them with a little straw.

In order to collect and raise dung, let a few yards square of land be selected in some convenient corner of the garden for the dung-heap. Let the ground be made a little hollow and the bottom well beaten, first covered with clay, if it could be procured. To this place lead all the refuse of the garden, such as Potato tops and Pea stalks, the faded leaves of Cabbages, Mangold Wurzel, &c., &c.; the stumps of Cabbages, Kale, Broccoli, &c.; dressings of copse, scourings of ditches, Ragweed, Docks, Thistles, Fern, &c., from waste land and road sides; bearing in mind that these are all cut before their seed be ripe, the best time being when they are in flower: serge or coarse Grass and rushes, from the margins of pits, ponds, ditches, and brooks. To all these, mix any dung which may be purchased or collected from the roads, or from the occupier's pig cote; the ashes from the cottage, and the sweepings of the cottage and yard, the night-soil, the urine from the cottage and pig cote, soap-suds and washings of the cottage. Let all these be laid together in regular layers as collected. A few cart-loads of bogsoil, or tanner's spent bark, might be added every year. The latter can be bought for 6*d.* per two-horse load. For the proper management of pigs, litter should be given them; and that not sparingly. This will add considerably both to the dung-heap and to the comfort of the animal; both of which should be constantly kept in view, or neither will the animal, the dung-heap, nor the cottager thrive. *Rothwell's Agriculture of Lancashire.*

Home Correspondence.

Failure of Clover.—Clover being introduced into the agriculture of this country as long ago as the 16th century, we may well think "it is but a poor compliment to the skill and research of the present century to have to acknowledge that we hardly know anything as to the cause of the failure of the broad Clover." Although I could never detect any parasitical plants on Clover, yet I have no reason to doubt the effect is sometimes caused by parasites, as I have never examined it by a very powerful lens. Most farmers assign causes for the failure of their Clover crop, to enumerate which would excite ridicule rather than elicit truth. "A Farmer" says, "From my own observation I am inclined to ascribe the failure of Clover partly to insects." (*Farmers' Magazine*). Undoubtedly insects are partly the cause of its failure, but in my opinion there is a mystery to be solved which is as yet unseen. If we look at the question in a chemical point of view, we should be not unapt to attribute it to a deficiency of pabulum, or to its being in an unfit state to be assimilated by the plant. This, I have no doubt, is often the cause of the failure of Clover. The Norfolk rotation being the prevailing one in this country still serves to strengthen my views; for how often do we see superphosphate, bones, or some other artificial manure, that contains only three or four ingredients, applied to the Turnip, and thought to be sufficient for the Barley and Clover following. Surely in these enlightened days my brother farmers ought not to be surprised at the failure of their crop under such absurd treatment; but the advantage of introducing the Bean into the four course rotation, so that Clover will come only once in eight years, instead of four, is a clear proof our present knowledge in chemistry is not equal to the task of giving a decided answer to this important inquiry, for these plants belong to one natural order; and chemical analysis shows us they are (as nearly as possible) alike in composition. The manures recommended to be applied as a top dressing have been many, but none has found so many advocates as gypsum, or sulphate of lime; but even this is now found to be of little use in the case of Clover-sick land. To wet clays, or high exposed fields, "in a cold dry, or a cold wet, spring, it will be of little use; but its effects will be great if the months of April and May are damp and warm" (*Schwerz's Precepts*), and the land to which it is applied is not really Clover-sick, or already contain a sufficiency of this valuable salt. Clover we know to be a deep-rooted plant, and should give it every facility for acquiring its natural habit of growth. Our present culture is not deep enough. At the depth of 6 inches we generally find a glazed surface to the substrata through which no plant can penetrate with that ease which will ensure its successful growth. Another cause—and perhaps a more formidable one than either of the foregoing—is the looseness of the soil. Clover delights in a soil of close texture, in giving which, the farmer will not only preserve it more safely from frosts, but will ensure a more invigorated growth. As to the seed being "doctored," my advice is, buy of a person on whom you can depend, for it is impossible for the most practised eye to detect the fraud of the experienced. Sulphur, indigo, logwood, copperas, and verdigris are all used in this nefarious practice. Was the seed improved in colour only by being thus "doctored," the loss would not be serious; but its vegetative powers are often destroyed, and the failure of the crop is the consequence. To those who choose to buy a low-priced sample rather than go to a respectable seedsman, I would offer the remark of Tusser:

"But ill shall he speed,
That soweth ill seed."

Was not the crop a very precarious one in this country, and a great exhauster of the soil, I should advise the growth of our own seed. Undoubtedly these reasons are the cause of the greater part of the Clover seeds being imported into this country. "It is particularly important to obtain favourable weather for sowing, so that not only the grain may germinate, but likewise the young plants may not be in danger of perishing from drought, or the attacks of aphides." (*Von Thaer.*) I have more than once seen the failure of this crop caused by feeding it late in autumn. This should never be practised in high lands, more especially when of a loose texture; for when fed off in that season of the year every plant that has its crown attacked will assuredly die, and others will meet a similar fate by their roots being exposed to the inclemency of our severe winters. *G. Summers, Stoke Wake, Dorset.*

Law Agents and Land Agents.—I am a lawyer, and one also entrusted by landlords with the management of their estates. I have been a subscriber to your Paper for some years, and have experienced much pleasure and advantage in the perusal of it. I have, however, frequently observed with pain the repeated attacks you have made upon the admixture of the solicitors' and the land agents' business; but never more so than in reading your Leading Article in your Paper of the 20th inst. You there observe, "a lawyer, who from his profession can have had no opportunity of making himself thoroughly acquainted with the value of land; and as he derives a profit from every legal transaction connected with the estate, what a fruitful source of litigation, seizures, confusion, and miseries of every kind!" My experience of law agents and land agents enables me to say that this charge is both illiberal and unfounded. As far as I am concerned myself, although I am entitled to be paid for legal business connected with the estate, independent of my salaries, I can say that for the last

14 years, with the exception of one single case, the landlords have not been asked by me for one single farthing for legal expenses, nor with that exception (and which was for the purpose of protecting a valuable right to the estate), have I ever been paid anything. I do not, however, judge from my own case; I know members of both classes, and I know that, on the whole, the interests of the landlord are as efficiently protected by the one party as the other; and not only the landlord's interest, but that which is of equal importance, the tenant's also. So far from a country solicitor not knowing anything of the value of land, it is the very main-spring of his existence. It is a subject that is brought daily under his most serious and anxious consideration, in the negotiation of purchases, and more especially the loans of money on landed securities. I agree with you, that a good and honest tenant is delighted by the periodical visits of his landlord; but I have known many delighted, too, not from a praiseworthy motive, but with the view of obtaining, or, at least, asking for grants to which he is not entitled, which he has not been able to obtain from the agent, and it has frequently resulted in the landlord's (otherwise liberally inclined) visiting his estates with an impression of disgust rather than of pleasure. My experience of both parties has also shown me, that the education of the lawyer has, for the most part (there are, of course, honourable exceptions), better fitted him for placing the landlord in that position in which he ought to stand with a tenant. One word more with regard to lawyers and litigation; I can tell you that the class of men (lawyers) who are entrusted with land agencies, are men who care very little about litigation. I can assure you, that the profit attending them, if honestly conducted, is, in many cases, barely mechanic's wages. On the other hand, I have known landlords involved in very serious litigation by the "go-a-head" qualities of a land agent. I have been induced to write hastily these observations, not so much with a view of setting up the lawyer above the land agent, as in the hope of satisfying you that there are two sides to a question, and that we must not expect to find perfection in any class of men. *N. P.*

Potato Crops in Ireland.—In my last letter I endeavoured to give your readers some idea of the extent of land planted with Potatoes in the barony from which I write this (the barony of Costello, county Mayo), and of the condition of the crops at the time of writing. In the latter I merely hinted at my fears of the existence of disease, though I well knew since the first week in May last that the disease existed, but to what extent it would or may hereafter prove mischievous, neither I nor any one else can tell. I would have said more on the subject then, but feared I should be set down as an alarmist, like others, who may be supposed interested in spreading such reports. I am no alarmist, and if I feel any interest at all in the matter it would be in suppressing such reports, lest their circulation should raise the price of provisions on the poor; lest such reports should influence the circulation of money from our banks; but, above all, lest they should exercise an injurious effect on the sales of property now under the hammer of the encumbered estates commissioners. I have been blamed, both last year and the year before, for being the first to publish the report of the disease, though reported in such a manner as to defy contradiction; and I may be blamed now for telling your readers that no matter how attempts may be made to disguise the fact, my belief is, that there is not a Potato field in all Ireland where the disease does not exist in some shape, and in every stage of the plant's growth. In some cases it is visible below the surface of the land, attacking the underground stem near the parent tuber, presenting not only a rusty but a rotten appearance, easily indicated by the sickly appearance of the plant above ground. In others the disease is visible by the pale appearance of the last formed young shoots at the extreme or highest points, followed by a shrivelling stunted appearance in the leaves, eaten through, as it were, first by fungus and finally by insects. In some of the most luxuriant-looking crops the black canker appears in the main stems or side shoots, and in others in the footstalks of the leaves, and this is the case in the principal counties of three provinces—Leinster, Munster, and Connaught, where I have been ever since I last wrote to you. My business was reporting on estates offered for sale, for the benefit of parties about to purchase; and here let me again caution such of your English readers as may be disposed either to become purchasers of property in Ireland, or become tenants on any of the many fine farms to let, against being influenced by what Professor Skilling said in his report, that "tillage will not pay here now." Tillage will pay and is paying wherever the proper relation between landlord and tenant is fully understood and exercised by landlords and tenants possessing adequate capital and skill for the management of their respective affairs, and my remarks on this head apply to each of the counties of the three provinces alluded to; and the insinuation that "tillage will not pay here now," clearly shows the writer's ignorance of the country, and, of course, also of the proper means of developing its vast resources. So, from the wilds of Connaught, I call on the learned Professor to justify his libel on the country. *Edward Carroll, Friar's-hill, Ballaghadareen.*

Road Reform—In the leading article of the *Agricultural Gazette*, of July 13, it is stated, "we may therefore diverge a little from the pounds, shillings, and pence path in which the argument for road reform might easily be brought to a most convenient and triumphant termination, in order to cull a few of those wayside flowers which constitute the travellers' bouquet, as he journeys along the turnpike roads of many parts of the United Kingdom." As the bouquet may not be completed for some time to come, perhaps a flower or two will not be rejected from one that has gathered many a blossom by the wayside. When turnpike roads are made in some parts of the country, it is no uncommon thing to have a footpath on one side of the road for the use of those who have to travel on foot, and the road is commonly fenced by means of walls or hedges. When a hedge is used for a fence, the Hawthorn is frequently planted, and for some time may be very well attended to, and kept in proper bounds, but a time frequently comes when the hedge is allowed to make improper inroads upon the footpath, so that the foot passenger is obliged to walk in the mud, being forced from walking on the narrow path, by the spreading branches of the boundary fence. The cultivators of the fields on the opposite side often take advantage of such hedges, and cut them in on their side as closely as possible, so that nearly the whole of the hedge is allowed to grow on the public footpath, to the width of 4 or 5 feet. That is surely too much. Now Mr. Editor, if you were to cut in the branches to the size they should be, the surplus would increase the dimensions of your bouquet considerably. The trustees of the public roads may object to your applying the hedge bill, but really there is much need for it in some places, although they should sing.

> "Gentle Hawthorn thrive,
> And, for ever alive,
> May'st thou blossom as now in thy prime,
> By the wind unbroke,
> And the thunder stroke,
> Unspoiled by the axe or time."

P. Mackenzie.

Report of Poor-law Board.—People may grumble at the national debt, and may call it a dead weight, an incubus, or any other hard name they please; but what is it when compared to the money expended in providing for paupers annually? many of whom are able-bodied. The report of the Poor-law Board states that 5,792,963*l.* have been levied for purposes connected with the poor of England and Wales in 1849. What a fearful sum collected from the working ants of the community. Can nothing be done to employ more hands, and reduce this ponderous tax? *Falcon.*

High Farming. — The term high farming is too often used to denote extravagant and experimental tillage; and this misleads those who are anxious to improve their land, but stand in fear of capacious tanks, sheds for manure, and palaces for cattle; in addition to all sorts of ploughs, harrows, drills, horse-hoes, scufflers, &c. To carry on the cultivation of land in the Mechian style requires a large capital, and can only be practised by men who can command supplies of money, and who kindly spend hundreds in order to promote a better system of working the land and feeding stock, without reference to profit. When farming is remunerative, at a fair average rent, it may be said to be approaching a high cast of agriculture. It is, of course, necessary to have fair accommodation on a holding, both for cattle and produce; yet it may be assumed that less expensive buildings, and a greater outlay in labour and manure, would be more profitable to the man who has to live by the produce of his land, than erecting structures more fitted for the habitations of men than animals. It is a reflection on our country to see pigs, cows, and horses luxuriating in cottages, whilst our labourers are, in many instances, vegetating in sties, bundled together in confusion, to which we do not subject our quadrupeds. If it is essential to the health of inferior animals to be dry lodged and well fed, which I contend it is, surely it is not less incumbent upon landlords, masters, &c., to place their dependants upon an equal footing with the lower grades of creation. I would, therefore, divide the expence of brick and mortar more fairly between the parties, giving the biped the preference in food and lodging; and, at the same time, not neglecting his mute companion fellow worker—the horse. It is most praiseworthy in gentlemen who can afford it, to lay out their spare cash in advancing the agricultural interest, thus enabling their neighbours to avoid errors both in expence and tillage; yet it is not wise to hold such persons up to the ordinary farmer as examples to be implicitly followed, as guides to the road to wealth. In farming, the most rigid economy, combined with industry and common sense, will do more to keep the plough going than anything else. *Falcon.*

A Prolific Sow.—We have in our possession a sow that has had, in six successive farrows, the following numerous progeny:—1st, 18; 2d, 18; 3d, 19; 4th, 20; 5th, 17; 6th, 19; making a total of 111 in two years and six months. *George Summers, Stoke Wake, Dorset.*

Poultry.—I hope that Mr. Dixon will allow me to call his attention to a deficiency in a work otherwise very interesting and useful. He has taken very little notice of the best and most economical mode of feeding fowls; and I believe none on the average quantity of grain each might be expected to consume. Many people do not keep them, from not knowing the proper quantity; and feeding them through a servant, they feel that they have no check upon the waste which is often committed, beyond what is necessary being evidently waste; nor do I find anything satisfactory upon this subject in other books. Moubray says (p. 124), in July 1806, a measured peck of good Barley kept in a high style of condition the following stock, confined and having no other provision:—one cock, three hens, three March chickens, six April, and six May do., during eight clear days, and one feed left." This gives $\frac{1}{10}$ of a pint to each fowl per day; or a pint would last each nine days and a half. But the different ages of the fowls allow us to determine very little from this experiment. Again, "A cock and two hens kept by themselves seven clear days in the winter season, consumed a quarter of a peck of the best Barley, having no other food, but as much of this as they chose to eat." This gives $\frac{4}{21}$ of a pint per day, or a pint would last each fowl five days and a quarter. Perhaps this might not much disagree with the former, if we had the means of estimating the difference of eating between chickens and full grown birds. Reaumur, whom I quote at second hand, not having his work by me, says a pint of Barley on the average will last a full grown fowl four days. I can furnish but little information on the subject myself. One year I kept an account of the fowls killed for the table, and found their number to be 105; and their Barley bill came to three guineas. The fowls had nothing else, but were at liberty, and had a considerable range over Grass. Mr. Dixon might add a very useful chapter to his work on poultry, by entering minutely on this subject, with the proper times of feeding and number of meals, and also the best and most economical way of distributing the grain, whether by troughs or scattering on the ground, in which case the sparrows get more than their fair share, eating all the fowls leave. I think it a great deficiency in almost all works on rural economy, that so little precision is used in stating the weight and measures of the articles used. *T.*

Bone Preparation for Manure.—There are three processes now in use for reducing bones to the crumbly or powdery state, fit for manure. 1, grinding, by which the harder parts are not often reduced much within a quarter of an inch in diameter; 2, Mr. Blackhall's steaming process, by which they are rendered tender and porous, and particularly suited for the action of acid, to make the superphosphate; 3, fermentation in heap, with earth, sand, or sawdust, introduced by Mr. Pusey, wherein ammonia being generated, the bone acquires some of the qualities of guano, but is rendered unfit for the action of acid, which the ammonia would neutralise. It becomes, then, an interesting question, which of the three is the most practically effective and generally eligible? Mr. Pusey's has the advantage of requiring no apparatus, and no great skill; so that it may be done by almost any farmer at home; and if the waste of ammonia is duly prevented, will have the effect of a mixture of bone-dust and guano—a result of some value now that guano is so much in demand, and so largely adulterated. Mr. Blackhall's product is the neatest, and as fit for the action of acids in the soil, as of the sulphuric above mentioned. But how it competes, in point of economy, with the old process of grinding? How the fermented bone competes with the superphosphate in fertilising power? and how the three kinds, crushed, steamed, and fermented, compete in cost and effect, without addition of acids? are questions on which light may be thrown by successive reports of the experiments now in progress in England and Scotland, and Ireland likewise; if the experimenters will favour us with such reports from time to time. *J. Prideaux.*

Blighted Wheat.—There are in my neighbourhood several fields of Wheat affected with blight, as the enclosed ear shows. The late sown seems at present to have escaped it. About four or five weeks since, we had several frosty nights, one of which was very severe. The late sown Wheat was not then come into ear, and is now looking remarkably healthy. I have a plot of ground on which is planted Peruvian Barley, and Potatoes; at the one end of the plot the Potatoes were cut off by the frost, at the other end they were not hurt; at the end where the Potatoes were frozen, there the Barley which had, up till that crisis, looked remarkably vigorous and healthy, turned all at once sickly and yellowish looking, and is now looking ready to harvest, whilst at the end where the Potatoes were not frozen, the Barley is green and looking as well as it ever did. I will enclose an ear of early and late sown Wheat, and two ears of my Barley. *W. Griffin.*
[The specimens perfectly illustrate your statement. We should suppose that the injury done by the frost occurred in the case of the early sown, at the period of flowering, and that the operation of fertilisation had thus been imperfectly effected.]

The Crops.—Grass has been good in this neighbourhood, and is nearly all stacked in good order. Wheat is very good, and promises to be a good crop. Oats very good, and like the Wheat crop have plenty of straw. Barley, the little that we have, is tolerably good. Tares have been very stout and good. Seeds are middling—not much Clover. Hops promise to mend, and if nothing happens will be low in price. Now examine the debtor side. Potatoes, I am very sorry to inform you, are going rapidly with the blight, which is appearing just as it did at first in 1845, with the black spots and the rusty dark stalks I first noticed about the 10th; it did not make much progress till yesterday, which being very hot and damp, increased it so much that there was a very visible difference between yesterday morning and this. There is not the same sweet fetid smell as before, and the stalks are rotting and break with a slight touch. It began with my early ones—Oxford and Cockney Kidneys not much affected yet—and now to-day is attacking the Shaws; my haulm is very strong planted—the seed Potatoes (not cut) on little hillocks 3 feet each way; no manure. I had

great prospect of an excellent crop, about half an acre in all. Best in the garden, &c., all are affected. It is beginning in all the neighbouring parishes, and appears, I am very much grieved to inform you, likely to be universal again. *W. Baldock, Rotherfield.*

The Judges at Exeter Royal Agricultural Society's Meeting.—Through the channel of your *Gazette*, will you allow me to make one or two remarks on the decision of the judges at Exeter? A few years ago a first-rate implement called a "broadshare plough," a very proper name, I think, was introduced to the notice of the Royal Agricultural Society, but was not allowed to compete for a prize, because of the name given to it; the appointed officials stating that it did not come within the meaning of certain wording in certain classes. When seen at the meetings of the Society, surprise was expressed that so good an implement was passed over; the answer received was, the reason before stated. You may judge my surprise when I find this very same implement, called by another name, a "two-horse scarifier" (a very unsuitable name), is now awarded a prize. The implement is the same it ever was, and I suppose the wording used in the different classes is the same, and yet by some curious plan a prize is now given. Is this good practice? I also observe that a horse which gains the 1st prize in the 1st class, and a capital horse it is—the *Times* calls it "a splendid animal, distancing all competition," was passed over at Norwich, and, if I mistake not, at York also, without a remark; when at Norwich prizes were awarded to comparative "rips." The *Times* stated, "In the present exhibition (at Exeter) the names of Messrs. Ransome, and other well known implement makers, are absent, because they are dissatisfied with the mode in which the business of the show-yard is conducted." In proof of the implement makers having sufficient reason for being dissatisfied, and the injury sustained by the public through the mismanagement of the officials appointed by the Council of the Royal Agricultural Society, I may state that one of the exhibitors, a well known first-rate maker, complains that seven minutes was all the time bestowed to look over his extensive stand, containing 30 distinct varieties of implements. A subsoil plough, known as "Read's patent subsoil plough," was not taken out for trial. A Linseed and Oat-crusher was not examined or tried, because the appointed judge said he knew it could not compete. Draining tools, to which the prize was awarded, are stated to have been erroneously entered (as I am credibly informed), being made by another manufacturer than the exhibitor. I think it quite right the public should make their remarks on the proceedings of the Council of the Royal Agricultural Society, and give them the opportunity of explaining their apparent misdoings. *Scrutator.*

Fences. — Since the days of Shakespeare many changes have taken place in our country. There have been horticultural improvements and agricultural improvements, but still there are many rough spots. If the author of Henry V. was to revisit our country, he would still see places where "nothing teems but hateful Docks, rough Thistles, Kecksies, Burs, losing both beauty and utility, and our hedges, defective in their nature, grow to wildness." The Whitethorn or Hawthorn is the plant commonly used for Thorn hedges. This plant has been described as branching out into innumerable ramifications, and, armed in all directions with strong thorns, may be so managed, as in a state of a hedge, to present a barrier impenetrable to any kind of cattle, and not without difficulty to be passed even by such disorderly persons as might wish improperly to intrude upon the rights of others. Fitted by Nature to assume a close and compact texture, which it possesses most fully during the expansion of its leaves, but retains, too, in a considerable degree after these have fallen off, it is not without the advantage of breaking the force of stormy winds, and mitigating the severity of the weather in favour of the vegetable and animal life which it is appointed to inclose. It is so hardy and patient of direction as easily to admit of being trained in the manner that may be desired; and unless there be some defect here, it will retain in that state of culture much of its native elegance and beauty. We have read much about the high and broad hedges of England, which are allowed to grow at large without let or hindrance in all the elegance and beauty of Nature; but we lately met with one in Stirlingshire which would match with some of those in the south. The fence is a mixture of Thorn and Holly, and has been planted many years ago, for it is now about 20 feet high and 12 feet broad. In its younger days a stone wall and the deep bed of a brook were between it and the cart-road; but its branches in places have reached the roadside, and kept from crossing it by means of the cart-wheels bruising its extremities. In many parts of the country the hot sun of summer has drunk up the streamlets dry, but beneath the thick branches of Thorn and Holly is heard unseen the gurgling sound of water. I tried now and then to get a peep through the thick enclosure, to observe what was growing within such a high and broad fence, and could see large tufts of Rushes and healthy-looking Sedge and Horse-tail and Thistles that would have pleased Burns to look upon, for he tells us that

> The rough Burr-thistle spreading wide
> Among the bearded bear;
> I turned the weeder-clips aside,
> And spared the symbol dear.

But as it is a disputed point among antiquarians what plant the Scotch Thistle is, some genuine patriots, in order to have the true one, allow all to grow. So any one, desirous of making a collection of such plants, could find some beautiful specimens without having far to travel for them. Such enormous hedges, protecting the pests of the farm, cannot be viewed in the light of an advanced state of agriculture, and they would not be permitted on a farm not far distant from them that has been let the other day within a little of 4*l.* per acre. *P. M.*

Societies.

HIGHLAND AND AGRICULTURAL: GLASGOW, *July* 31. — The great gathering of this Society commenced on Tuesday, on a large space of meadow ground called Glasgow-green, situated on the right bank of the river Clyde. The show yard occupied about 20 acres of the lower or south-eastern part of the green, which was railed off for the purpose. The implements of husbandry were nearly all placed at their respective stands by afternoon, when the judges began their inspection. This occupied the greater part of the following day, Wednesday. Towards 3 or 4 o'clock the premium and commendation tickets were affixed to those articles considered by the judges to be most meritorious. Compared with the Society's show at Edinburgh two years ago, the present is decidedly superior, so far as the number of implements exhibited is concerned, and in many instances there are gratifying proofs of the progress which mechanical invention has been making during that time. It was thought by many that the discontinuance of the annual exhibitions of stock and implements for a longer period, proposed two years ago, would damage the future "gatherings" of the Society, by allowing emulation to flag; but so far as yet appears, the effect seems to be quite the other way. The following will give a general idea of the magnitude and practical utility of the Glasgow show. In Section 1 to Section 7 of implements we have 18 entries of two-horse ploughs for general purposes, 16 ploughs for lea or seed furrow, 13 double mould-board ploughs for forming drills, 4 heavy subsoil ploughs for moor and stony land, requiring the power of three or more horses to each; 10 light subsoil ploughs, capable of being worked by two horses each; 3 ploughs for filling in or returning the earth upon drains, and 3 ribbins or drill paring ploughs, for preparing a drilled bed for grain sown broadcast—in all 67 entries of ploughs of various descriptions, but some of the implements entered have not been exhibited. There are 14 two-horse grubbers exhibited, of various constructions; 17 one-horse grubbers for green crops, 4 Norwegian harrows, several land rollers, and 10 sets of harrows. Several of these implements, such as the ploughs, harrows, rollers, and pulverisers, were tried on the farm of Polmaclie on Wednesday morning. The ground was a stiff clay, and well adapted for exhibiting the comparative merits of implements adapted for such land, so far as such imperfect trials will admit of a proper comparison being made. A great many spectators attended the trial, thus showing the interest taken in the practical working of farm implements, and could such trials be better arranged there is no doubt that they would form the most useful and attractive exhibitions that the meetings of our large agricultural societies could afford. As it is at present, it is doubtful if they be of much benefit, unless so far as satisfying the judges may be concerned.

In Section 28 there were nine chaff-cutters, the most approved of which were those exhibited by Richmond and Chandler, Salford, Manchester, and to one of which the premium was awarded. The action of the pinnacle-shaped toothed rollers was greatly admired for the accuracy and rapidity with which the stuff to be cut—whether matted or straight—was drawn in unassisted, and held while the cutting knives were doing their work. The cutting part consists of a disc, with convex knives, working at a right angle to the material to be cut. This chaff cutter, from its construction, is neither liable to choke with thick feeding, nor does it require much attention on the part of the person who feeds—all that is necessary being to keep the hopper well filled with material; and, provided the power be adequate, the thicker it is fed the better it cuts. A very simple and ingenious machine was exhibited in this section by Mr. William Lorimer, Crosshill, Maybole, and named by him the Canadian chaff cutter. It consists of two rollers, the lower one being a simple cylinder of wood, while the upper is of iron, on the periphery of which is fixed a number of parallel knives, about 1 inch apart at their extreme edges, and about the same in depth. This roller touches but does not press on the lower one, and the straw or hay to be cut being laid on the feeding board, the two rollers working inwards pull it in, and cut it at the same time in 1-inch lengths, with great rapidity and speed. Said by the exhibitor to cut 1500 feet of straw per hour into 1-inch lengths, with one person driving. This implement was ridiculously dear for the material and workmanship of which it was composed, the price being 6*l.* —Sections 29 and 30 contained 11 Turnip cutters for sheep or cattle. Gardiner's double action cylinder cutter, exhibited by Richmond and Chandler, was considered best for sheep—although it cuts for cattle also by reversing the motion; and James Kirkwood, Tranent, East Lothian, exhibited a Turnip cutter which got the premium for slicing Turnips for cattle. Gardiner's machine is too well known to require description. Kirkwood's is on the old disc principle with the knives on the side, and can be made to cut either for cattle or sheep, and either to work by dragging it behind a cart, or by hand, merely by allowing it to stand on two legs behind—the front being supported by a wheel, raising the two side wheels from the ground and using them to give momentum. The principal improvement in this machine consists in the hopper being supplied with a small spiked roller at bottom, which catches the Turnips, prevents them from rolling round, and holds them till cut. The machine is of iron partly cast and partly malleable. —Sections 31 and 32 consisted of Linseed bruisers for hand or power, and Oat and Bean bruisers of the same description. Of the former there were six implements exhibited, and 12 of the latter. Messrs. Richmond and Chandler's second-sized spirally-grooved roller machine was considered the best, and obtained the premium for bruising Linseed, and as its construction and mode of working are explained fully in the report of the English Society's show, it is unnecessary to repeat it here. A. and W. Smith and Co., Woodside Works, Paisley, obtained the premium for the best Oat and Bean bruiser. It consists of a single fluted roller working against a fluted breastwork, which being moveable by screw work, can be adjusted to cut or bruise grain to any required size. The feed is delivered from a board in the hopper having a quick vibrating motion, and the quantity is regulated by giving it more or less inclination.—In Section 33 we have two cylindrical Potato or root washers, with Archimedian screw inside, which retain and wash their contents when turned in one direction, and pitch them out into a spout when turned the opposite way. This machine was originally invented by S. Carr, Germany.—In Section 34 there were four different kinds of apparatus for steam purposes. The prize was awarded to A. and W. Smith, Paisley, for an apparatus consisting of a circular boiler, with fireplace and flue running through the centre. The length of the boiler is 4 feet, and the diameter 3 feet, and holds about 80 gallons of water, when filled to the proper level. The boiler is fitted with safety valve, steam cock, and the water is fed into the boiler from a pipe, the top of which is about 7 feet above the water line. The supply of water is regulated by the float in the boiler, which communicates with a valve at the top of the pipe by means of a horizontal lever, which becomes depressed at the one end, when the float sinks in the boiler, and at the same time opens the water-valve at the other or raised end, and allows it to flow into the boiler, until the rising of the boiler-float shuts it again. This self-acting feeding apparatus is said to be very accurate in its working, and not liable to get out of order. The steam part consists of two sheet-iron tubs, placed on either side of the boiler, having false perforated bottoms about two inches from the true bottom. The steam is admitted under the false bottom, but sufficiently high to allow room for the steam condensing. The lid of the steaming tubs is of wood, which lies loose in the top, and the inventor of the machine affirms that roots are sooner and better cooked when there is a considerable escape of steam at top than when perfectly steam tight. The chamber below the false bottom contains the condensed steam, and also whatever matter (whether noxious or otherwise) that may have been extracted from the cooked food by the action of the steam. It takes 20 minutes to raise steam, and 20 more to cook completely the contents of both tubs.—Sections 36 and 37 consisted of one-horse farm carts and light spring carts; 12 of the former and only one of the latter. The workmanship of the whole of the farm carts was highly creditable to the makers, showing that this is a class of farm implements congenial to the wants of Scottish agriculture. The prize was awarded to Robert Grey and Sons for a double lock and elevator tilt cart. The elevator consists of two bars of iron about a foot apart, fixed to the bottom of the cart, 8 or 9 inches behind the front sheath. These two bars are pierced with holes at convenient distances, for the purpose of tilting the cart to different elevations, and catching on a bar of iron underneath, so that the strain is entirely removed from the front sheath, while, at the same time, in consequence of the tilting apparatus having two bearings instead of one, as is usually the case, the jolting motion peculiar to tilt carts having only one bearing in the centre, is completely done away with. The body of the cart when not tilted is retained in its place by a horizontal spring fixed to the shafts, which catches at both sides when the body is pulled smartly down. This spring is thrown out of the catch by pulling a handle at the near side of the cart. Robert Buchanan Forbes exhibited a remarkably well finished tilt cart in this section, with a self acting tilting apparatus, which worked remarkably well as exhibited in the yard, but which there is reason to fear would be very liable to derangement in the various dirty purposes to which a farm cart is applied. This cart had another serious fault in the tilting apparatus, viz., a piece of iron projecting nearly a foot underneath the front bearer, and upon which a restive horse would be very liable to get his legs cut, either when kicking, or on soft land, when the cart began to sink. There were only four tilt carts exhibited in this section, the others having the body fast, and none of them possessed that simplicity in the tilting apparatus which is so essential to an implement applied to so many purposes. A proper farm cart must, however, necessarily be capable of being tilted, without disengaging the horses; and hence the reason why in this case the prize was awarded to a cart which probably possessed no superior claims to merit over the others, than that of having a tilting apparatus. Those carts were most commended which exposed fewest tenons to view, or to the action of the atmosphere, such being the parts at which a shaft or a sheath soonest gives way. Alexander Reid, Bollingshaw, Stewarton, exhibited a very ingenious tilt cart for hilly land, which became heavier on the horse's back when going up hill, and lighter when going down. The axle is crank-shaped at the ends (like those of the large "floats" used for heavy goods in large towns), and being bent downwards about a foot, serves to place the centre of the cart very low. The shafts of the cart and the body are placed upon different centres, so that while the whole cart when locked becomes heavier when raised, the body when unlocked tilts with the same ease as any other cart. The hay or harvest carts exhibited were of good construction, and the premium was awarded to Mr. Law, of Shettleston, for a cart with wheels 4 inches broad at the tire and very little dished. Mr. Forbes exhibited a harvest cart furnished with a powerful lever for shifting the load either backwards or forwards as might be required.—In Sections 43 and 44 were exhibited a variety of portable threshing machines, on the Scotch principle, all being furnished with rollers and beater drums. The beaters of some of the drums, however, consisted of a double row of pikes for stripping out the grain, instead of beating it out. This appears to be a useful application of the principle of Atkinson's patent peg drum, the power required to work these drums being nearly one-third less than that of the common beaters, while the straw is less broken also. There are no pegs in the drum concave of these mills, as is the case with Atkinson's patent. The question of beater *versus* peg drums is still unsettled, but there is no doubt of the fact that the peg drums with rollers are coming more and more into use, while the peg drum on Atkinson's patent is falling out of favour entirely. Mr. William Lorimer, Crosshill, Maybole, exhibited a very strong and complete four-horse threshing machine, for which he obtained the premium. The rollers are 4 feet wide, and can be thrown in or out of gearing, or they can be made to go fast or slow, by merely turning a handle within reach of the feeder. The drum is on the peg principle, so far as the substitution of pegs for beaters is concerned, but there are none in the drum concave. This machine is furnished with riddles, elevators, and fanners, by which the grain is delivered into the sack ready for market. The drum and shakers are placed close to the ground, while the fanners are placed above them, the grain and chaff being carried up by elevators. The whole height of the machine is 12½ feet, and its price is 65*l.* Several entries for threshing mills on the English principle were made, but none appeared in the yard, with the exception of Mr. Crosskill's, Beverley. In this machine the drum is a skeleton, with narrow beaters revolving at a great velocity at a distance of three-eighths of an inch from fluted breast-work, against which the grain is beaten. The straw is thrown out upon an inclined shaker, the spars of which, armed with pikes, work through each other, and carry the straw with a jerking motion up an inclined plane, and delivers it at the highest point. The show of hand-winnowing machines was very inferior, there scarcely being a good one in the whole yard. Mr. Law, of Shettleston, obtained the prize for a machine of a very simple construction, without either shuffle-board or riddles. Mr. John Wightman, Comber, Ireland, exhibited a very ingenious double blast machine, which was highly commended by the judges. Of drill sowing machines for grain, there are only a very few, and so far as this may be taken as an indication of the progress of drilling corn crops in Scotland, it appears that none has been made since the Edinburgh meeting two years ago. There are a considerable number and variety of implements for sowing Turnips in drills, such a thing as sowing Turnips broadcast scarcely being believed by the Scotch farmers. There are four machines in the yard for making pipes and drain tiles from clay; two for making pipes and tiles from peat moss, and one for separating stones and other extraneous matter from clay, and bringing it into a fit state for the manufacture of drain tiles. The interest in this department seems to have abated to a considerable extent, for although there are 18 machines entered for exhibition, only seven have made their appearance in the yards. In addition to the above, the show yard contains a large assortment of miscellaneous and extra articles which it is of little interest to enumerate. The exhibition of dairy produce is very large and of first rate quality, as was anticipated from the locality of the show being so near Ayrshire and other dairy counties in the west of Scotland. Next week a complete list of all the premiums will be given.

Aug. 1.—The show of cattle, sheep, horses, &c., commenced to-day, and while we write, the judges are inspecting the stock in their several departments, and the whole awards will be published in the evening, but too late for this week's *Gazette*. The public dinner of the Society will take place to-night in the City Hall, and Friday will conclude the show.

Miscellaneous.

The Diseases of Animals.—From the result of the labours of one or two eminent veterinary surgeons, we have collected several important statistical facts with regard to the nature of the diseases with which horses and cattle are commonly visited. Thus Mr. Perceval has given the following table (Farmer's Mag., vol. 22, p. 110), showing the ages at which horses appear most disposed to certain diseases.

Diseases.	Patients under five years old.	In their fifth year	Above 5, and under 10.	Above 10, and under 20.	Twenty and upward.	Total.
Of the lungs	170	50	20	50	10	300
Of the bowels	10	20	40	70	20	160
Of the brain	4	2	5	14	2	27
Of the eyes	30	10	70	35	5	150
Total	214	82	135	169	37	637

Of the 637 cases brought under medical treatment, 134 had a fatal termination. The deaths, therefore, were at the rate of 21·03 per cent. In 300 pulmonary cases, 77 died, or 26·66 per cent. The nature of the mortal diseases of cows, during a certain portion of the year, may be pretty well estimated from the following little table of the causes of the death of 118 cows in the six months from May 3 to Nov. 3, 1844, dispersed through the various English grazing districts, whose lives had been insured by one of the metropolitan cattle insurance societies. The returns were in this case made by various veterinary surgeons. Of these 118 cows there died of

Pleuro-pneumonia	72	Inflammation of liver	1
Accidents	9	Inflammation of bowels	1
Blackwater	1	Loin fallen	2
Colds or inflammation	2	Milk fever	3
Constipation of the bowels	2	Poisoned	1
Constipation of the manifolds	2	Rheumatic fever	1
Decay	3	Water on the brain	2
Diarrhœa	1	Paralysed stomach	2
Hoven	3	Shute	1
Hoose	1	Quinsey	1
Inflammation (undefined)	1	Cancer	1
		Doubtful	3

The reader will note that of these cases 72, or more than 7-12ths of the above deaths, arose from pleuro-pneumonia, a disease, at least in its present leading symptoms, of but recent occurrence.—*Bell's Weekly Messenger.*

Calendar of Operations.

JULY.

Bedfordshire Farm, *July* 30.—Hay-making and Turnip sowing having been concluded for some time, the labour of the farm is chiefly connected with the hand and horse-hoeing of the green crops, threshing and dressing corn, and finishing off odd jobs in preparation for harvest. We have already cut and carried some Peas, and will either sow Turnips, Mustard, or Trifolium upon the ground for a second crop. The Pea crops are light here, and are so generally around us; they have been much injured by hosts of insects while blossoming. Our winter Beans are pretty good; if anything too much straw, and too few pods. The spring Beans are inferior. Potatoes are now growing away vigorously, without any sign of complaint. Indeed a good breadth around us has been already dug and disposed of in the London markets. The Turnip crops have gone on very indifferently until the late rains. We have had occasion to sow twice in several fields, and filled up more or less over the entire crop. Where the rows were very defective, a one-row hand machine was used to fill up: in other cases seed was dibbled in at the ordinary intervals Turnips are allowed to stand at when set out. There is now a good chance of having a full crop, from the appearance of the braird in the original blanks. The Mangold Wurzels have thriven admirably, and never promised better for a heavy crop. With ordinary weather, the reaping of Wheat will be pretty general here in less than a fortnight. Some of the crops are very much laid and twisted by heavy storms of rain, and there are many pieces of a very blighted appearance. *R. V.*

Notices to Correspondents.

Boarded Flooring: *An Improver.* We have no personal acquaintance with the subject; and therefore applied to one who has had ample experience. In reply, he stated his intention to describe the thing fully: but we must wait his leisure.

Books: *A Subscriber.* We believe the book on the value of land is published at No. 7, John-street, Adelphi.

Cow Parsnip: *Scotia.* We have to beg pardon for the delay of this answer. We can find hardly anything on the agricultural use of the plant: and have no personal experience of it. You will, we imagine, have to find out the degree and manner of its usefulness yourself. Its rapid growth, one would suppose, to confer succulence sufficient to adapt it as food. See a further description at page 454 of the *Gardeners' Chronicle*, 1848.

Exeter Meeting: *R N.* Mr. Hare is not to publish an illustrated catalogue of the Exeter Implement Show.

Essay on the Wireworm: *Arator.* The prize has not yet been awarded, we believe.

Farm Accounts: *An Old Subscriber.* We should advocate the plan recommended in Mr. Morton's article in the "Cyclopedia." It is the one we adopt on a farm of about 300 acres.

Heather: *G Lee.* Heather is used as litter, and will partly rot in the dung-heap. Can any one give us their experience on this point?

Manuring: *Inquirer.* The constant use of quick-lime in compost with the earth of headlands—for use broadcast over Grass-land, cannot balance the loss which such lands, as ordinarily treated, sustain. Probably the best way to ascertain if Grass-lands require lime is to try a small portion for a year or two, before the general dressing is intended.

Manure Heap: *J B.* We have to apologise for the delay of an answer to this and some other questions, which arrived during the Exeter week. One ton of gypsum to from 80 to 100 tons of farm-yard dung, assisted by the layer above and below the ditch mud, will, one would think, suffice to retain any products of fermentation. Supposing your dung to contain 9 or 10 cwt. of ammonia in every 100 tons, nearly 2 tons of gypsum would be needed to furnish sulphuric acid enough to unite with all the volatile alkali; but a great deal will be retained by the vegetable earth of the ditches, and a great deal will be latent in the dung until the manure shall have been perfectly rotted, after being ploughed into the land.

Mason Work: *Inquirer.* We cannot give specifications; that must be the work of your architect.

Milk: *Birkhurst.* 10 to 14 quarts of milk will give 1 lb. of butter. How much you obtain depends upon your consumption of milk.

Mr. Fowler's Drain Plough: It appears that justice was hardly done to Mr. Fowler's Drainage Apparatus by our reporter at Exeter. The machine by which his row of pipes is laid underground differs from the ordinary mole-plough in possessing an apparatus which enables the driver to sink or to raise the "mole," as the machine proceeds; so that so far as his judgment is a sufficient guide, the unevenness of the surface may be corrected, so as to have no influence on the even path of the tunneller below. Mr. Fowler informs us that he is about to construct a machine which shall of itself correct the inequalities of the surface movement, so as to destroy the undulation which would by it be impressed upon the position of the tube of pipes.

Poultry: *A Subscriber.* The complaint from which the chickens suffer, is a fatal scourge which is not easily subdued. It may arise from the spot on which they are reared having been over-bred for several years past. As no circumstances are stated, we can only suggest to give them plenty of dry food in regular supply, to keep them within doors during showery weather, to white-wash the fowl-house, and to attend generally to cleanliness and ventilation. This latter point is not sufficiently looked after in fowl-keeping. The writer of this has just lost some valuable birds from their having been thoughtlessly shut up at night in a close house, wherein a crop of Potato-onions had been laid to dry; so that the poor creatures were actually stifled to death.—*Epsilon.* Feed the bantam cock liberally with dry food, as bread crumbs, Wheat, and rice not too much boiled; administer one or two doses of calomel and colocynth pills in the same quantity as for an adult man or woman.

Rape: *Inquirer.* Sow any time from May till July, and you will have a crop ready at any time from August till November. Sow about 5 lbs. broadcast, or 3 lbs. in rows 12 to 15 inches apart, on the flat. We never knew White Mustard used for soiling cattle.

Straw-cutter: *A Scotchman.* Try Cornes', of Barbridge, near Nantwich, Cheshire. That is the advice of the judges of the English Agricultural Society. Or if you want one to cut for only a few mouths, try the Guillotine cutter, by Ward and Co., of Stourbridge. Rye-grass must be enclosed between top and bottom layers of straw in the feed-box to cut well. There are many cake-breakers: Messrs. Ransome, of Ipswich; Hornsby, of Grantham; Wedlake, of Romford; and others, make them.

Tank: *Constant Reader.* The odour may, in a great measure, be stopped, by adding gypsum. If oil of vitriol is to be had cheap, add it from time to time, whenever the addition causes effervescence.

*** Communications reaching town after Wednesday, cannot be answered till the following week.

Markets.

COVENT GARDEN, Aug. 3.

Vegetables are abundantly supplied; Hothouse Grapes and Pine-apples plentiful. The supply of Peaches and Nectarines is well kept up. Ripe Gooseberries fetch from 2s. 6d to 3s. 6d. per half sieve. Oranges and Lemons though scarce are sufficient for the demand. Carrots and Turnips may be had at from 3d. to 6d. per bunch. Potatoes are plentiful and cheap. Lettuces and other salading are sufficient for the demand, and so are Mushrooms. French Beans are scarcer. Cut Flowers consist of Heaths, Pelargoniums, Lily of the Valley, Carnations, Picotees, and Roses.

FRUITS.

Pine-apples, per lb., 4s to 6s	Lemons, per doz., 1s to 3s
Grapes, hothouse, p. lb., 2s to 5s	Oranges, per doz., 2s to 3s
Peaches, per doz., 4s to 15s	— per 100, 8s to 24s
Nectarines, per doz., 4s to 15s	Almonds, per peck, 6s
Apricots, per doz., 1s 6d to 5s	— sweet, per lb., 2s to 3s
Cherries, per lb., 6d to 1s 6d	Walnuts, p. 100, 1s 6d to 2s
Melons, each, 3s to 5s	— p. bush., 16s to 24s
Gooseberries, per half sieve, 1s 6d to 2s 6d	Nuts, Barcelona, per bush., 20s to 22s
Currants, p. half sieve, 3s to 4s	— Brazil, p. bsh., 12s
Raspberries, p. pottle, 4d to 6d	

VEGETABLES.

French Beans, p. sieve, 3s to 4s	Shallots, per lb., 6d to 8d
Cabbages, per doz., 6d to 1s	Garlic, per lb., 4d to 8d
Cauliflowers, p. doz., 2s to 4s	Artichokes, per doz., 2s to 4s
Peas, per sieve, 2s to 4s	Vegetable Marrows, per doz., 1s to 2s
Beans, per sieve, 1s 6d to 2s	Lettuce, Cab., p. sc., 2d to 1s
Sorrel, p. hf. sieve, 6d to 9d	— Cos, p. score, 6d to 1s 6d
Potatoes, per ton, 50s to 80s	Radishes, p. 12 hands, 9d to 1s
— per cwt., 2s 6d to 4s	Small Salads, p. punn, 2d to 3d
— per bush., 1s 6d to 3s	Mushrooms, p. pot., 9d to 2s
Turnips, per doz. bun., 3s to 5s	Fennel, per bunch, 2d to 3d

SMITHFIELD, Monday, July 29.

The supply of Beasts is small, and the average quality inferior; consequently there is a considerable advance on the choicest descriptions. The number of Sheep is also less; we have a brisk sale, at rather more money. Lamb is in request, at fully Friday's quotations, but higher rates cannot be quoted. Calves are not so plentiful as of late; they are more readily disposed of, at an advance of about 2d. per 8 lbs. From Holland and Germany there are 601 Beasts, 2520 Sheep, and 204 Calves; from Scotland, 200 Beasts; from Norfolk and Suffolk, 500; and 1700 from the north and midland counties.

Per st. of 8 lbs.—s d	s d	Per st. of 8 lbs.—s d	s d
Best Scots, Herefords, &c.	3 10 to 4 0	Best Long-wools	to

Best Downs and Half-breds	— —	Ditto Shorn	3 0 — 3 4
Ditto Shorn	4 0 — 4 2	Lambs	4 4 — 4 10
		Calves	2 8 — 3 6
		Pigs	3 0 — 4 0

Beasts, 3259; Sheep and Lambs, 28,160; Calves, 309; Pigs, 242.

Friday, Aug. 2.

The number of Beasts exceeds the demand; a reduction of about 2d. per 8 lbs. is submitted to. We have a larger supply of Sheep and Lambs, but the quality is not very good; on the average prices are lower. Trade is exceedingly bad for Calves, owing to a large supply and close weather. From Germany and Holland there are 244 Beasts, 1200 Sheep, and 315 Calves; from Scotland, 150 Beasts; 250 from the Midland, and 92 Milch Cows from the home counties.

MARK LANE.

Monday, July 29.—The supply of Wheat from Kent this morning was again small, but good from Essex. Factors at opening of the market held for an advance, which, owing to the day proving fine, was not complied with, and the great bulk remained unsold towards the close. In foreign, business was unimportant and confined to the most necessitous buyers, on the terms of Friday last, being about 1s. per qr. advance on the rates of this day week.—Barley is a more free sale, and 6d. per qr. dearer.—There is no alteration in Beans.—Peas meet an improved inquiry.—Oats are rather a better sale and the turn higher.—Rape-seed is offered at 28*l.* without finding buyers.

Friday, Aug. 2.—The supply of English corn this week has been moderate, but the arrivals from the Continent of Wheat, Barley, and Oats are considerable. To-day's market was thinly attended, and but a limited business transacted in all descriptions of grain; we observe no alteration in the value of Wheat, Barley, Beans, or Peas.—The Oat trade is heavy at Monday's prices.—There is rather more demand for Flour at full prices.—The value of Indian Corn is nominally unaltered. Since the heavy rain which was general on Saturday, the weather has been on the whole dry, but the atmosphere cloudy and heavy, and the crops consequently maturing slowly. Accounts of the Potato disease from Ireland have been less important this week, but increase from various parts of Great Britain and the Continent; at present, however, we do not think them of sufficient consequence to cause alarm.

Liverpool, Friday, July 26.—Exclusive of a good supply of Malt, we have received little produce, either coastwise or from Ireland, since Monday last; but have to report a moderate quantity of Indian Corn and Flour from the United States, a further good arrival of Wheat, with several cargoes of other grain from Europe, and nearly 4000 sacks of French Flour. Wheat has advanced in some of the English counties, 1s. to 2s. per qr. Flour was in fair demand. Barley was the turn dearer. Malt stationary. Beans commanded more attention, and Egyptians improved 3d. to 6d. per qr. Peas advanced 1s. per qr. Oats were held on rather higher terms; Oatmeal met very little notice, and hardly sustained late prices. Indian Corn was disposed of with less facility, and advanced 2s. per qr. ——Tuesday, July 30.—With a return of fine weather the market this morning ruled dull for the leading articles. About one-half of the advance on Wheat, Flour, and Indian Corn made on Friday (viz. 2d. per bushel, 1s. per sack, and 2s. per qr.), was considered to be lost, and the sales in retail. Spring corn, on the contrary, in good demand. Oats brought full prices. Grinding Barley was 1d. per bushel, Peas, 1s., and Beans 6d. per qr. dearer than last Tuesday. The following are the present prices: Wheat, English, red, per 70lbs., 5s. 11d. to 6s. 5d.; white, 6s. 2d. to 6s. 8d. Barley, Scotch and Irish, per 60 lbs., 2s. 9d. to 3s. Malt, English, per qr., pale, 48s. to 52s. Oats, English and Scotch, per 45 lbs., 2s. 8d. to 2s. 10d. Beans, English, per qr., 28s. to 32s. Peas, do. do., 27s. to 30s.

BOTANICAL WORKS BY PROFESSOR LINDLEY.

SCHOOL BOTANY; or, the Rudiments of Botanical Science. New Edition. 400 Illustrations. Price 5*s.* 6*d.*

Just published, in demy 8vo, price 2*s.* 6*d.*

ORCHIDACEÆ LINDENIANÆ; or, Notes upon a Collection of Orchids formed in Colombia and Cuba, by Mr. J. Linden. By John Lindley, Ph. D., F.R.S. and L.S., Professor of Botany in the University of London, and in the Royal Institution of Great Britain.

"We assure our readers that it contains a vast quan tityof matter interesting and useful to many classes of persons, and to none more so than to Pharmaceutists, to whom we strongly and cordially recommend it."—*Pharmaceutical Journal.*

PROFESSOR LINDLEY'S ŒCONOMICAL BOTANY.

This day is published, in one vol. 8vo, with numerous woodcuts, price 14*s.*

MEDICAL AND ŒCONOMICAL BOTANY; or, An Account of the Principal Plants employed in Medicine or Domestic Œconomy.

The first two Parts of The Elements of Botany, comprising Structural and Physiological Botany, and a Glossary of Technical Terms, are published in one octavo volume, price 12*s.*

These three parts form a complete manual of Botany for Medical and other Students who have made themselves acquainted with the author's "School Botany."

"It will be found a useful and intelligent guide to the poultry keeper, while the lively and often amusing manner in which it is written gives it a claim upon the attention of the general reader."—*Midland Counties Herald.*

"This book is the best and most modern authority that can be consulted on the general management of Poultry."—*Stirling Observer.*

EXTRACT FROM THE AUTHOR'S PREFACE.

"The Vegetable Kingdom contains, among a large quantity of plants of no known importance to man, various useful species employed in medicine, the arts, or in the many branches of domestic œconomy. The principal part of those which can be brought by teachers in Europe under the notice of students, or which, from their great importance, deserve to be among the earliest subjects of study, are mentioned in the following pages, where they are arranged in the manner proposed in the 'Vegetable Kingdom' of the author, with the sequence of matter departed from in a few instances, when it was believed that the convenience of younger students would be consulted by doing so. The author trusts that this selection will be found to have been made in such a way that all teachers who possess reasonably extensive means of illustrating their lectures, and all Botanic Gardens, may furnish the larger part of the species which are mentioned. A small selection was indispensable; firstly, because a greater work would have been beyond the reach of the majority of purchasers; and secondly, because experience shows us that those who have to study a science of observation, such as Botany, require to concentrate their attention, in the first instance, upon a limited number of objects."

THE ELEMENTS OF BOTANY, Structural, Physiological, and Medical. With a Sketch of the Artificial Methods of Classification, and a Glossary of Technical Terms. Price 12*s.* cloth.

The Glossary may be had separately, price 5*s.*

This will complete the series of Elementary Botanical Works by Professor Lindley, of which "School Botany," and "The Vegetable Kingdom," form the other parts.

THE VEGETABLE KINGDOM; or the Structure, Classification, and Uses of Plants; illustrated upon the Natural System. Second Edition. 500 Illustrations. Price 30*s.* in cloth.

*** To suit the convenience of Students and others, the above Work is issued also in 12 Monthly Parts, price 2*s.* 6*d.* each.

On the 31st was published, price 2*s.* 6*d.*, No. VI. of

PAXTON'S FLOWER GARDEN.

Edited by Dr. Lindley and Joseph Paxton,
And Illustrated by highly finished Plates and Woodcuts.
London: Bradbury and Evans, 11, Bouverie-street.

ENGINEERING SCHOOL CLASS-BOOKS.

In crown 8vo, 4*s.* 6*d.* bound, with 220 Diagrams engraved for the Work,

EUCLID'S ELEMENTS OF PLANE GEOMETRY; with Explanatory Appendix and Supplementary Propositions for Exercise. Adapted for the Use of Schools, or for Self-instruction.

By W. D. Cooley, A.B., Author of the "History of Maritime and Inland Discovery," "The Negro-land of the Arabs," &c.

"The editor has done all that could be done to make Euclid easy to beginners."—*Cambridge Chronicle.*

"Mr. Cooley seems almost to wish to contradict his own motto, that 'there is no royal road to Geometry,' for following in the steps of Playfair, he has considerably diminished both the volume of the work as well as the labour of the student. Prefixed to the Elements are some remarks on the study of mathematics, as valuable for the elegance of their style as for the correctness of their reasoning."—*Civil Engineer and Architect's Journal.*

"This is the best edition of the Elements which has yet appeared."—*Athenæum*—"which, for brevity, clearness, and discerning attention to the wants of learners, cannot be easily surpassed."—*Dublin University Magazine.*

"Will be found of considerable value as an aid to teachers of the Mathematics."—*New Monthly Magazine.*

Uniform with the 'Elements,' price 3*s.* 6*d.*

COOLEY'S GEOMETRICAL PROPOSITIONS DEMONSTRATED; or, a Supplement to Euclid: being a KEY to the Exercises appended to the 'Elements,' for the use of Teachers and private Students. Upwards of 120 Propositions deduced from the First Six Books of Euclid, are illustrated in it by new Diagrams.

Whittaker and Co., London.

Handsomely bound in cloth, with 93 Wood Engravings, Price 6*s.* 6*d.*,

ILLUSTRATIONS OF THE BIBLE, AND CONFIRMATIONS OF SACRED HISTORY, from the Monuments of Egypt. By W. C. Taylor, LL.D.

From the British Magazine.—"This is an elegant and well executed little book, on a most interesting subject."

From the Birmingham Herald—"A valuable and indispensable accession to the library of every Biblical student."

From the Rev. Thomas Hartwell Horne's Introduction to the Critical Study of the Scriptures.—"Nearly 300 texts of Scripture are more or less explained in this elegantly-executed volume, and in a manner equally curious and interesting."

Price 5*s.* 6*d.*, cloth,

THE HISTORY OF THE UNITED STATES OF AMERICA. By John Frost, of Philadelphia.

Price 7*s.* 6*d.*, cloth,

THE HISTORY OF FRANCE, from the Earliest Period. By Emile de Bonnechose. The two volumes of the French edition comprised in the one of the translation. This work is the history approved of by the Minister of Public Education in France, where it has already passed through five editions. London: D. Bogue, 86, Fleet-street.

Popular Works

PRINTED FOR

TAYLOR, WALTON, AND MABERLY,

BOOKSELLERS AND PUBLISHERS TO UNIVERSITY COLLEGE,

28, UPPER GOWER-STREET, AND 27, IVY LANE, PATERNOSTER ROW, LONDON.

DARLEY'S SCIENTIFIC LIBRARY

FOR THE USE OF

SCHOOLS, PRIVATE STUDENTS, ARTISTS, AND MECHANICS.

It is the purpose of this Work to furnish a Series of Elementary Treatises on Mathematical Science, adapted to the wants of the public at large. To youth of either sex at public and private schools; to persons whose education has been neglected, or whose attention has not been directed in early life to such studies; and to Artists and Mechanics these little works will be particularly suited. The principles of the various Sciences are rendered as familiar and brought as near to our commonest ideas as possible; the demonstrations of propositions are made plain for the mind and brief for the memory, and the Elements of each Science are reduced not only to their simplest but to their shortest form.

I.

A New Edition (being the fifth) *is now ready,*

A SYSTEM

OF

POPULAR GEOMETRY;

Containing in a few Lessons so much of the Elements of Euclid as is necessary and sufficient for a right understanding of every Art and Science in its leading truths and great principles.

By GEORGE DARLEY, A.B.

Price 4*s.* 6*d.*, cloth.

II.

New Edition (just published),

COMPANION

TO THE

POPULAR GEOMETRY;

In which the Elements of Abstract Science are familiarised, illustrated, and rendered practically useful to the various purposes of life, with numerous Cuts.

By GEORGE DARLEY, A.B.

Price 4*s.* 6*d.*, cloth.

III.

Third Edition,

A SYSTEM

OF

POPULAR ALGEBRA;

WITH

A Section on PROPORTIONS and PROGRESSIONS.

By GEORGE DARLEY, A.B.

Price 4*s.* 6*d.*

"For Students who only seek this limited knowledge of these sciences, there are, perhaps, no treatises which can be read with more advantage than 'Darley's Popular Geometry an Algebra.'"—*Library of Useful Knowledge, article "Mechanics."*

IV.

Second Edition,

A SYSTEM

OF

POPULAR TRIGONOMETRY,

Both Plane and Spherical.

With POPULAR TREATISES on LOGARITHMS, and the Application of Algebra to Geometry.

By GEORGE DARLEY, A.B.

Price 3*s.* 6*d.*, cloth.

V.

FAMILIAR ASTRONOMY.

By GEORGE DARLEY, A.B.

With Engravings.—12mo, 5*s.*, cloth lettered.

"There is a vast deal of astronomical information conveyed in a most winning and unassuming manner in this delightful little volume, which not less for the novelty of its plan than the extent of its intelligence, reflects infinite credit on the taste and talents of its projector and editor, Mr. Darley."—*Sun.*

Second Edition, Revised and Enlarged,
Just published, price 4*s.* 6*d.* in one small vol., 12mo

RURAL CHEMISTRY.

By Edward Solly, Esq., F.R.S., F.L.S., F.G.S.; Hon. Memb. Roy. Agr. Soc. Eng.; Professor of Chemistry to the Horticultural Society of London; Lecturer on Chemistry in the Hon. E. I. Co.'s Military Seminary at Addiscombe, &c.

Parties not in communication with a bookseller, may have the work sent, free by post, for 4*s.* 6*d.*, on remitting a post-office order to that amount to the Publisher, James Matthews, at the office of the *Gardeners' Chronicle.*

Price 5*s.* 6*d.*, cloth,

ORNAMENTAL AND DOMESTIC POULTRY; their History and Management. By the Rev. Edmund Saul Dixon, M.A., Rector of Intwood with Keswick.

The Birds treated of are

Domestic Fowl in general
The Guinea Fowl
The Spanish Fowl
The Speckled Dorkings
The Cochin-China Fowl
The Malay Fowl
The Pheasant Malay Fowl
The Game Fowl
The Mute Swan
The Canada Goose
The Egyptian, or Cape Goose
The Musk Duck

"RENT, LOCAL TAXATION, TENANT RIGHT."

Just published, with Tables and Illustrations, price 1*l.* 5*s.*,

THE AGRICULTURAL REFEREE AND GUIDE TO THE VALUATION OF REAL PROPERTY; which indicates the equitable rent of the several descriptions of land applicable to the purposes of agriculture, including an exposition of the principle that governs local taxation with reference to land, to railways, and the tithe commutation rent charge; and an equitable system of tenant-right. Dedicated to the Royal Agricultural Society of England. By LAYTON COOKE, Land Agent, Surveyor, and "Real Property" Valuer.

London: Published by the Author, at No. 10, Parliament-street.

SCIENTIFIC GARDENING.

THE ALPHABET OF SCIENTIFIC GARDENING. By Professor RENNIE. A new Edition, with numerous Engravings. 18mo, cloth, gilt edges. Price 1*s.* 6*d.*; or, free by post, 20 stamps.

"This practical little work should be in the hands of every gardener, amateur, or professional; and will soon repay the outlay of 18*d.*, being full of valuable information."

London: JAMES CORNISH, 297, High Holborn (removed from Middle-row).

LOUDON'S HORTUS BRITANNICUS.

Just published, a New Edition, in 8vo, price 31*s.* 6*d.* cloth,

HORTUS BRITANNICUS: a Catalogue of all the Plants indigenous to, cultivated in, or introduced into Britain. By J. C. LOUDON, F.L.S., &c. A New Edition (1850), with a Supplement including all the plants down to March, 1850; and a New General Index to the whole Work. Edited by Mrs. LOUDON; assisted by W. H. BAXTER, Esq., and DAVID WOOSTER.

*** The New Supplement may be had separately, price 14*s.*

A NEW EDITION OF LOUDON'S ENCYCLOPÆDIA OF GARDENING, corrected to 1850 by Mrs. LOUDON, is also in course of publication, in Ten Monthly Parts, price 5*s.* each.

London: LONGMAN, BROWN, GREEN, and LONGMANS.

THE PRACTICAL GARDENER AND MODERN HORTICULTURIST; in one volume, 988 pages, closely printed, with upwards of 300 illustrated Woodcuts, containing the present improved scientific mode of managing the Kitchen, Fruit, and Flower Gardens, the Greenhouse, Hothouse, Conservatory, &c. By CHARLES M'INTOSH, C.M.C.H.S., of Dalkeith Palace. In cloth, lettered, price 21*s.*; and also with Specimens of choice Flowers, coloured, 26*s.*

"The labour and experience of a life devoted to the science of Horticulture."—*Vide Author's Preface.*

With an APPENDIX, describing a new and economical method of producing uniform Bottom-heat from Hot Water in Tanks, upon the most simple plan, with explanatory Diagrams, and Reference to Buildings now in successful operation; by which means, the "King of all Fruits," the Pine, and other tropical fruits and flowers, may be cultivated at less than half the expense of the old system.

London: THOMAS KELLY, Paternoster-row; SIMPKIN, MARSHALL and Co.; and sold by all booksellers.

THE HIPPOPOTAMUS presented by H. H. the Viceroy of Egypt to the Zoological Society of London, is exhibited daily from One to Six o'clock, at their Gardens in the Regent's Park. The Band of the First Life Guards will perform, by permission of Colonel Hall, every Saturday, at Four o'clock. Admission One Shilling, on Mondays Sixpence.

METCALFE AND Co.'s NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth-Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most extraordinary manner, and is famous for the hairs not coming loose.—1*s.* An Improved Clothes-Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-Brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh-Brushes of improved, graduated, and powerful friction. Velvet-Brushes, which act in the most surprising and successful manner. The genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE, BINGLEY, and Co.'s Sole Establishment, 130 B, Oxford-street, one door from Holles-street.

METCALFE'S ALKALINE TOOTH POWDER, 2*s.* per box.

CAUTION.—Beware of the words "From METCALFE'S," adopted by some houses.

HAMMERSMITH.—TO GENTLEMEN, NURSERYMEN, AMATEURS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS will submit to public competition by Auction, on the premises, Swiss Cottage, Hammersmith, on TUESDAY, 13th August, at 1 o'clock (by order of the executors of the late J. W. Appleford, Esq.), the whole of the GREENHOUSE PLANTS, comprising choice Cacti, Aloe, Camellia, Geranium, Fuchsia, Nerium, and Chrysanthemums, 50 rows of choice named Tulips, fine Carnations, &c.; also two newly-erected Greenhouses, two 2-light Boxes, Tulip Stage, Irons, seven Hives of Bees, two Pigeon Aviaries, a Chunk Stove, four Crucible Vases, Water Tubs, Bricks, Paving Tiles, Miniature Pots, Garden Pans, &c.; also about 40 Fancy Pigeons, consisting of Almond Tumblers, Turbots, Dunn, Black, Blue, and White Horsemen, &c.—May be viewed prior to the sale, and Catalogues had (6*d.* each, returnable to purchasers), on the premises, of the principal Seedsmen, and of the Auctioneers, American Nursery, Leytonstone, Essex.

HARDY AND OTHER CONIFERÆ.

MR. J. C. STEVENS will sell by Auction, at his Great Room, 38, King-street, Covent-garden, on MONDAY, 5th August, at 12 for 1 o'clock, a fine collection of CONIFERS, in pots, comprising many rare and beautiful species, such as Abies gigantea, Picea grandis, Pinus Winchesteriana, Taxus japonicus, Juniperus thuriferæ, &c.; also some extraordinarily fine plants of Araucaria imbricata, 3 feet high, the rare Araucaria glauca, Cunninghamii, excelsa, &c.—May be viewed on Saturday, morning of sale, and Catalogues had.

THE FINEST COLLECTION OF SPECIMEN AND OTHER HEATHS THAT HAS EVER BEEN OFFERED TO PUBLIC SALE.

MR. J. C. STEVENS is favoured with instructions from SIGISMUND RUCKER, jun., Esq., who is giving up Heath growing, to submit to unreserved sale by Auction, at his Great Room, 38, King-street, Covent-garden, on FRIDAY, the 9th of August, at 12 for 1 o'clock, the whole of his magnificent Collection of ERICAS, consisting of about 200 Plants, about 100 of which are Exhibition Specimens, and many of them unrivalled both as to form and size. This collection, which is generally admitted to be the finest in the kingdom, will be found to combine all the most rare species, with the popular and well known sorts.—May be viewed on the day prior and morning of sale, and Catalogues had of Mr. J. C. STEVENS, 38, King-street, Covent-garden, London.

EAST INDIAN ORCHIDS.

MR. J. C. STEVENS begs to announce that he will sell by Auction, on FRIDAY next, at about 3 o'clock (after the sale of Mr. Rucker's Heaths), a small but very select parcel of EAST INDIAN ORCHIDS in the finest health, comprising Saccolabium guttatum, Dendrobium Farmerii, D. transparens, D. Devonianum, a lovely new Cœlogyne, of which a drawing will be shown, &c.—May be viewed the morning of sale, and Catalogues had.

FARM TO BE LET.

MR. HURLEY is instructed to Let, with immediate possession, a CAPITAL FARM, situate near Kingston, Surrey, 15 miles from London, and within 3 miles of two railway stations, consisting of 110 acres of Arable and rich Pasture Land, with excellent House, and numerous Farm-buildings, all in good repair. Rent, Tithes, and Rates, included, 1*l.* per acre. There is a long Lease also attached. Stock and Implements to be taken by valuation.—Apply at the Estate Office, 62, Nelson-square, Blackfriars-road, London.

SURREY.—CAPITAL FARM TO BE LET, WITH IMMEDIATE POSSESSION, 16 MILES ONLY FROM LONDON-BRIDGE.

MR. HURLEY, AUCTIONEER and FARM AGENT, is instructed to Let an ELIGIBLE FARM, consisting of a good Farm-house, three Barns, extensive Stabling, Coach-houses, numerous Farm Buildings, Yards, Bailiff's Cottage, &c., all in good repair; also two detached Cottages, Barns, Stables, and Fold Yards, with upwards of 600 acres of Arable, Coppice, and Meadow Land (73 of the latter). Rent, 370*l.*; Tithe, 148*l.*; Rates, 105*l.*; Term, 21 years.—For further particulars, apply (with three postage stamps) to Mr. HURLEY, Offices, 62, Nelson-square, Blackfriars-road, London.

THE BENEFICIAL EFFECTS OF HOLLOWAY'S PILLS IN LIVER COMPLAINTS.—A Gentleman who resides at Dhobah Factory, near Culnat, Calcutta, writing to his father, James Nichol, Esq., 15, Rathbone-place, Oxford-street, states that he suffered severely from a liver complaint and a dreadful pain in his side, and that he has derived more benefit from taking HOLLOWAY'S Pills for a short time than he was able to obtain under the treatment of several medical men in India for 17 months previously; therefore Officers in the Army and others, who, through living in hot climates, are martyrs to disordered stomachs, Liver complaints, or Indigestion, should take these invaluable Pills, being a safe and effectual remedy for those diseases. Sold by all druggists, and at Professor HOLLOWAY'S Establishment, 244, Strand, London.

WANTED, near London, a Small Nursery, or Market Garden, where there are Vineries, Frames, &c., and a Dwelling House.—Apply to N. B., 3, Steers-terrace, Walham-green, Fulham, Middlesex.

ANNUAL DIVISION OF PROFITS.

GREAT BRITAIN MUTUAL LIFE ASSURANCE SOCIETY, 14, Waterloo-place, and 52, King William-street, City.

THE CHISHOLM, *Chairman.*

RICHARD HARTLEY KENNEDY, Esq., *Deputy Chairman.*

This Society is established on the tried and approved principle of Mutual Assurance. The Funds are accumulated for the exclusive benefit of the Policy-holders, under their own immediate superintendence and control. The Profits are divided annually, and applied in reduction of the future Premiums. At the Annual General Meeting, held on the 9th ult., an elaborate and highly satisfactory Report of the state of the Society's affairs was submitted to the members, whereupon it was resolved, unanimously, that an allowance of 30 per cent. should be made on the Premiums payable on all Policies on the participating scale, on which five or more yearly payments had been previously made. Credit is allowed for Half the Annual Premium for the first five years. The following Table exemplifies the effect of the present reduction:

Age when Assured	Amount Assured	Annual Premium hitherto paid.			Reduction of 30 per cent.			Annual Premium now payable.		
	£.	£	*s.*	*d.*	£	*s.*	*d.*	£	*s.*	*d.*
20	1000	20	17	6	6	5	3	14	12	3
30	1000	25	13	4	7	14	0	17	9	4
40	1000	33	18	4	10	3	0	23	14	10
50	1000	48	16	8	14	13	0	34	3	8

A. R. IRVINE, Managing Director.

14, Waterloo-place, Aug. 3.

PROFESSOR LINDLEY'S INTRODUCTION TO BOTANY, 4th Edition, with Corrections and Additions, now ready, in 2 vols. 8vo, with Six Copper-plates and numerous Wood Engravings, price 24*s.* cloth.

London: LONGMAN, BROWN, GREEN, and LONGMANS.

Lately published,

DARLEY'S SCIENTIFIC LIBRARY, for the Use of Schools, Private Students, Artists, and Mechanics.

It is the purpose of this Work to furnish a Series of Elementary Treatises on Mathematical Science, adapted to the wants of the public at large. To youth of either sex at public and private schools; to persons whose education has been neglected, or whose attention has not been directed in early life to such studies; and to Artists and Mechanics, these little works will be found particularly suited. The principles of the various Sciences are rendered as familiar, and brought as near to our commonest ideas, as possible; the demonstrations of propositions are made plain for the mind, and brief for the memory; and the Elements of each Science are reduced not only to their simplest but to their shortest form.

FAMILIAR ASTRONOMY.—By GEORGE DARLEY, A.B., 12mo, with Engravings, 5*s.* cloth lettered.

"There is a vast deal of astronomical information conveyed in a most winning and unassuming manner in this delightful little volume, which, not less for the novelty of its plan than the extent of its intelligence, reflects infinite credit on the taste and talents of its editor, Mr. Darley."—*Sun.*

A SYSTEM OF POPULAR GEOMETRY; containing in a few lessons so much of the Elements of Euclid as is necessary and sufficient for a right understanding of every Art and Science in its leading Truths and general Principles. By GEORGE DARLEY, A.B. 5th Edition. 4*s.* 6*d.* cloth.

COMPANION TO THE POPULAR GEOMETRY; in which the Elements of Abstract Science are familiarized, illustrated, and rendered practically useful to the various purposes of Life, with numerous Cuts. By GEORGE DARLEY, A.B. Second Edition. 4*s.* 6*d.* cloth.

A SYSTEM OF POPULAR ALGEBRA, with a Section on Propositions and Progressions. By GEORGE DARLEY, A.B. Third Edition. 4*s.* 6*d.*

A SYSTEM OF POPULAR TRIGONOMETRY, both Plane and Spherical; with Popular Treatises on Logarithms, and the application of Algebra to Geometry. By GEORGE DARLEY, A.B. Second Edition. 3*s.* 6*d.*, cloth.

TAYLOR, WALTON, and MABERLY, Booksellers and Publishers to University College, 28, Upper Gower-street, and 27, Ivy-lane, Paternoster-row, London.

INTERESTING FACT.—The following singular and authentic case of restoration of the human hair is worthy of observation, more particularly as it relates to an article of high and universal repute during the last half century. "Mr. A. Hermann, of Queen-street, Soho, had been quite bald for some time past, and had tried various preparations for the recovery of his hair, but without any beneficial result. He was then induced to try the effects of 'Rowland's Macassar Oil,' and after daily applying it for about two months, he, much to his gratification, had his hair quite restored, and now possesses a beautiful head of hair. This fact speaks too strongly for itself to require comment."—*Bell's Weekly Messenger.*

ROWLAND'S MACASSAR OIL.—The unprecedented success of this discovery in restoring, preserving, and beautifying the Human Hair, is too well known and appreciated to need comment. For Children it is especially recommended as forming the basis of a Beautiful Head of Hair, and rendering the use of the fine-comb unnecessary. Price 3*s.* 6*d.*—7*s.*—Family Bottles (equal to 4 small), 10*s.* 6*d.*, and double that size, 21*s.* per bottle.

*** Each bottle of the genuine article has the words ROWLAND'S MACASSAR OIL engraved in two lines on the Wrapper; and on the back of the Wrapper nearly 1500 times, containing 29,028 letters.

Sold by A. ROWLAND and SONS, 20, Hatton Garden, London; and by Chemists and Perfumers.

MECHI'S PAPIER MACHE TEA TRAYS are decidedly the most unique and elegant ever manufactured. The designs are various, as well as the prices, and the economical may be suited as easily as those whose wealth entitles them to seek for the most recherché articles which art can produce. The papier-maché work-tables, work-boxes, tea-caddies, writing-cases, inkstands, hand-screens, card-boxes, &c., are really superb. MECHI has a stock of dressing-cases not to be surpassed; also an immense assortment of writing-desks, table cutlery, Sheffield plated ware, &c. His cushioned bagatelle tables are renowned for their superior construction.

Manufactory, 4, Leadenhall-street, London.

Printed by WILLIAM BRADBURY, of No. 13, Upper Woburn-place, in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 7, Church-row, Stoke Newington, both in the County of Middlesex, Printers, at their office in Lombard-street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles-street, in the parish of St. Paul's, Covent-garden, in the said county, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, AUGUST 3, 1850.

HORTICULTURAL SOCIETY OF LONDON.—EXHIBITIONS AT THE GARDEN IN 1851.

Notice is hereby given that the Exhibitions of Flowers and Fruit will take place in the Society's Garden on the following SATURDAYS in the year 1851, namely, May 3, June 7, and July 19.

THE GREAT WEST OF ENGLAND DAHLIA EXHIBITION, Open to all England, will be held at Wilton Park, Salisbury, on Wednesday, the 28th of August next. Full particulars may be had on application to
Aug. 10. JOHN KEYNES, Hon. Sec., Salisbury.

A GRAND DAHLIA EXHIBITION, Open to all England, will be held on Tuesday, August 20, 1850, at Cremorne Gardens, when Two Silver Cups, of the value of Five Guineas each, will be awarded, together with 50 money prizes. Schedules, and other particulars, may be had upon application to JOSEPH ROBINSON, Superintendent of the arrangements, 5, Kempe's-row, Pimlico, London.

MESSRS. VEITCH AND SON'S CATALOGUES OF NEW AND RARE PLANTS, STOVE AND GREENHOUSE PLANTS, GERANIUMS, AMERICAN PLANTS, &c., &c., are now ready, and can be had, on pre-paid application, by enclosing two postage stamps.—Exeter, August 10.

MAYLE'S MODEL FUCHSIAS FOR 1850.

MESSRS. MAYLE AND CO. inform the Nobility, Gentry, and the Trade, that these seven unrivalled new reflexed Fuchsias are ready for delivery, and have proved themselves the most superb varieties ever raised. Circulars can be had upon application. See Mr. GLENNY'S opinion in the "Country Gentleman," August 5, page 491.

"HEBE is one of the pale varieties, white, with scarlet corolla, the sepals reflexing very gracefully, and forming a striking feature.

"STANDARD OF PERFECTION is scarlet, with a purple corolla. Sepals reflexing very beautifully.

"Had these come out as a pair, at the full price charged for the lot, nobody would have grumbled."

HEBE was awarded a first-class Certificate at the Birmingham and Midland Society, July 16.

105, New-street, Birmingham.

MUSHROOM SPAWN FOR SALE.

WILLIAM FREEMAN returns his grateful thanks to the trade for the liberal support he has received for the last 28 years, and he begs to inform them that he has the largest quantity and of the finest quality now on sale, which is well worthy of their attention. Samples will be sent to any part of the kingdom, if required.—For particulars and terms, address to WILLIAM FREEMAN, Kensal New Town, Paddington.

N.B. No one need apply but the Trade. Country orders immediately executed.

NEW SEEDLING STRAWBERRY—MYATT'S "SURPRISE."—This is a variety raised from the British Queen, which it resembles, though of a more robust habit, and a very free bearer, producing a greater abundance of those large angular-shaped Strawberries than any other variety, and finishing off the last fruit of a good size. Strong plants will be ready the beginning of August, price 50*s.* per 100.

Strong plants are now ready, price 50*s.* per 100. Also Myatt's Eleanor, 5*s.* British Queen, Globe, Mammoth, Comte de Paris, Hooper's Seedling, Black Prince, Keen's Seedling, Swanston's Seedling, Elton Pine, 3*s.* 6*d.* Fertilised Hautbois, 5*s.*

Manor Farm, Deptford.

IXORA SALICIFOLIA (TRUE), WILLOW-LEAF IXORA.

MESSRS. VEITCH AND SON are now prepared to send out strong plants of the above beautiful and distinct IXORA, received by them from Java through Mr. Thos. Lobb. It is a lovely free-blooming species, flowering in a very young state, and at the Chiswick Exhibition in July last received the first prize for new and rare plants, the Silver Gilt Medal. It is figured and described in Curtis's "Botanical Magazine" for July last.

Strong well established plants 21*s.* each; one over to the Trade on three.—Exeter, Aug. 10.

G. BASSILL, Pheasantry, Hemel Hempstead, Herts, within one mile of the Boxmoor station, on the London and North-Western Railway. Orders now taken for Poults, having a large quantity bred under his own special care.

PINE-APPLE PLANTS.—Thirty-six Pine Plants in Fruit, with fine suckers on them; 67 fine Succession Plants, eight Stools with good suckers on them, also 12 Crowns. The above all in the very best health, belonging to a gentleman near Camberwell.—Apply to JAMES CUTHILL, Florist, Camberwell, near London.

HUGH LOW AND CO. have just published their GENERAL CATALOGUE OF PLANTS, which can be had free on application.—Clapton Nursery, London. Aug. 10.

WARRANTED BEST MATERIALS AND WORKMANSHIP AT THE LOWEST POSSIBLE PRICES.

J. WEEKS AND CO., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

GRAPE VINES IN POTS FOR FORCING.

J. WEEKS AND CO., King's-road, Chelsea, beg to call attention to their splendid collection of Grape Vines, all struck from eyes, now two and three years old, the finest Plants that have ever been offered for Sale, consisting of 60 varieties, all of the best sorts, warranted true.

THE HAMBURGHS AND MUSCADINES being the best for early forcing in pots, this is the best time for Gardeners to have them, so as to get the eyes ripe and prominent. This Nursery is well worthy of a visit, as all modern Horticultural improvements are in full operation.

J. WEEKS and Co., King's-road, Chelsea.

GREENHOUSE AND CONSERVATORY BUILDING ESTABLISHMENT, HOT-WATER APPARATUS MANUFACTORY, KENSALL-GREEN, HARROW-ROAD, LONDON.

JOHN TAYLOR begs most respectfully to call the attention of the Nobility, Gentry, and Gardeners, to the very superior manner in which he erects all kinds of Greenhouses, Conservatories, Forcing Pits, &c., and all other buildings for Horticultural purposes, combining all the most modern improvements with elegance and utility. His manner of heating Horticultural Buildings, Churches, Chapels, Public Buildings, Entrance Halls, &c., has received the greatest approbation from the Nobility and Gentry by whom he has been extensively engaged.

STEELE'S PREPARATION, for preventing Weeds, Moss, &c., from growing on Parades, Garden-walks, and Roads. Sold in 5-gallon bottles, at 1*s.* 6*d.* per gallon.

Also, PEAT, BOG-EARTH, and LOAM, in bags not less than 5 cwt., at 9*d.* per cwt.

Orders, enclosing Post-office orders made payable to JONATHAN STEELE, Post-office, Dockhead, immediately forwarded to any part of the country.

Factory, Plough-road, Rotherhithe.

GLASSES FOR WALL-FRUIT.

HALLIMAN'S FRUIT PROTECTOR, Registered March 22, 1850.

PEACH AND GRAPE GLASSES.—These Glasses, placed over Fruit on the the common wall, assist Nature in our cold climate. The Fruit grows to a larger size, and its richness is increased.

JAMES PHILLIPS & CO. beg to say they have purchased the above Registry of Mr. HALLIMAN, and caution all persons from making or selling the same without their consent.

FERNS.

J. PHILLIPS and Co. have succeeded in making a very neat style of Shade, with glass bottom (or stand), expressly for the growth of Ferns, which will be found much more ornamental than any previously made for the same description of plant. Prices and every information to be had of JAMES PHILLIPS and Co., 116, Bishopsgate-street Without, London.

MITCHELL'S MINERAL BLACK PAINT.—This antiseptic Paint is intended for Park Fencing, and for all farming purposes; it is particularly adapted, by its prevention of dry rot in timber and repellance of damp, for Barns, Stables, Outhouses, Weather Boarding, Hop-poles; also for Carts, Waggons, &c., particularly the Wheels, and for Iron Hurdles, Iron Railings, and all Wood or Iron Work in exposed situations. For Brick Walls it is highly serviceable as a preventive of damp, and also for Walls intended for Fruit Trees, as, besides preserving the Wall, it increases the heat in all situations exposed to the sun, and prevents the harbouring of insects. It is also an excellent covering for Canvas, or Cart Tilts, Roofing, &c. Sold in casks containing from 1 cwt. to any quantity, at 17*s.* 6*d.* per cwt., quite ready for use, by

JAMES PHILLIPS and Co. (the sole agents), 116, Bishopsgate-street, Without, London.

HARTLEY'S PATENT ROUGH PLATE GLASS.

JAMES PHILLIPS AND CO., 116, Bishopsgate-street Without, beg to hand their list of Prices of the above description of GLASS. Cut to order in panes of

8 by 6	and under	10 by 8	at 4½*d.* per foot.
10 by 8	,,	14 by 10	at 5*d.* ,,
14 by 10	,,	1½ foot, or sizes not exceeding 20 inches long	at 5½*d.* ,,
1½ foot	,,	3 feet, or sizes not exceeding 30 inches long ...	at 6*d.* ,,

PACKED IN BOXES of 50 feet each.

6 by 4 and 6½ by 4½...10*s.* 6*d.* 8 by 6 and 8½ by 6½...13*s.* 6*d.*
7 by 5 and 7½ by 5½...12*s.* 0*d.* 9 by 7 and 10 by 8 ...15*s.* 0*d.*

We do not pledge ourselves to execute large orders for small squares at the above prices, but only as far as they turn up in cutting. Should any quantity of small squares be required, a special contract is necessary.

MILK PANS 2*s.* to 6*s.* each, Metal Hand-frames, Tiles, and Slates; Propagating and Bee Glasses from 2*d.* each; Cucumber Tubes, 1*d.* per inch; Peach Glasses, 10*d.* each; Wasp Traps 3*s.* 6*d.* per dozen; Pastry Slabs, Hyacinth Glasses and Dishes, Shades for Ornaments, Fish Globes, Plate and Window Glass of every description, and Lamp Shades. Lactometers for trying the quality of Milk, 4 tubes, 7*s.* 6*d*; 6 tubes, 10*s.* Self-registering Thermometers for Greenhouses, Horticultural Glass, &c.

From the *Gardeners' Chronicle*, December 8, 1849:

"As for the article substituted for Rough Plate, and which is actually in the market for the purpose of imposing upon gardeners, it is wholly unfit for any horticultural purpose. The best samples of it which we have yet seen is sold by Mr. JAMES PHILLIPS, 116, BISHOPSGATE STREET, LONDON."

GLASS FOR CONSERVATORIES, &c.

HETLEY AND Co. supply 16-oz. Sheet Glass of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery. Lists of Prices and estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE-GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY and Co., 35, Soho-square, London.

See the *Gardeners' Chronicle* first Saturday in each month.

A LIST OF NEWLY INTRODUCED PLANTS, now off red for the first time, by JAMES VEITCH AND SON, NURSERYMEN, &c., Exeter.

Escallonia macrantha.	Hoya coriacea.
Ixora salicifolia (true).	Dipteracanthus spectabilis.

T. MILLINGTON'S SHEET GLASS, which is of the best description, varying from 16 to 32 ounces, at from 2d. per foot and upwards; 100 feet and 200 feet cases of large Sheet Glass, for cutting up, at 2¼d. per foot. British Plate Glass, from 1s. 2d. to 2s. per foot, according to size. Patent Rough Plate Glass, from ⅛ to 1 inch in thickness, from 4d. per foot upwards. Glass Slates and Tiles. Milk Pans from 12 to 24 inches diameter, from 2s. to 5s. each Cucumber Tubes, from 12 to 24 inches long, at 1d. per inch. Lactometers, 7s. 6d. each. Wasp Traps.—Lists may be had, on application at the Warehouse, 87, Bishopsgate-street Without, same side as the Eastern Counties Railway.

CROWN, SHEET, AND ROUGH PLATE GLASS FOR HOTHOUSES, CONSERVATORIES, &c.

The Improved Patent Rough Plate, made by Messrs. Hartley and Co., can be supplied from this Warehouse, of every size and substance, at the same prices as at the works.

100 and 200 feet cases of large Sheet Glass, from 2¼d. per foot. Small ditto, 10s. 6d. per 100 feet, packed in boxes ready for immediate delivery. Curators of Botanical Societies, Florists, Railway Agents, and others requiring large quantities, will, on sending dimensions, receive estimates at the lowest prices.

GLASS MILK PANS, CREAM POTS, Lactometers, Bee Glasses, Fish Globes, and all kinds of Dairy Glass, Propagating Glasses, Hyacinth Dishes, Cucumber Tubes, and every other description of Garden Glasses.

PATENT GLASS PENS, self supplying, never blot, never soil the ruler, and will write continuously for 12 hours.

Also, Glass Rulers, Glass Inks for office-stands, desks, &c. Stationers and Schools supplied. Wholesale Warehouse for Ornamental Shades, Lamp Shades, Gas Glasses, Genuine White Lead, Paints, Colours, and Pumps for Farm purposes.

Our Catalogue of 18 folios is the most complete ever published. No Gardener or Farm Bailiff should be without one. May be had Gratis on sending two postage stamps to Messrs. COGAN and Co., 48, Leicester-square, London.

EDWARD BECK, SLATE WORKS, ISLEWORTH. SLATE CISTERNS, &c.; COLE'S PATENT.

E. BECK informs Horticulturists and the Public generally that Mr. COLE has granted him the use of his Patent for the unexpired term, and he is now able to supply SLATE CISTERNS fastened without iron bolts or the usual oil cement, thereby doing away with the difficulty which has hitherto existed of forwarding such articles by rail or waggon, fixed and ready for use instead of in pieces, as heretofore.

E. B. will be happy to answer any inquiries as to the price of Cisterns, or any other Slate articles manufactured by him, such as Orange Tubs, Plant Boxes, Tanks, Shelves, Garden-path Edging, Hot-water Tank Covers, Flower Boxes for Balconies, Shelves fitted to hold water for Orchidaceous Houses, &c., all of which may be seen in use at Worton Cottage, Isleworth, on application to the Gardener, Sundays excepted.

Estimates given for Work as shown upon Drawings, and in specifications. A large stock of Slate Slabs of all sizes and thicknesses, kept on sale.

N.B.—Dairies fitted either with Shelves or Milk Pans, of very neat appearance.

PIMLICO SLATE WORKS. — Cisterns, Filters, Milk and Salting vessels, Corn and Flour Chests, Sinks, Dairy and Larder Shelves, Malting and other Flooring, Skirting, Refrigerators, Garden Edging, Flower Boxes, Pine pit Linings, Hot-bed Frames, moveable Cattle Sheds, Coping, Drain Stones and Traps, Steps and Risers, Balcony Landings, Roofing Slates, ridge roll and flap; Waste Slate for drains, Sun Dials, Fountains, and all descriptions of plain Slate Work in Town, or direct from Mr. MAGNUS'S Works in North Wales.

ENAMELLED SLATE Chimney-pieces, Billiard Tables, Console and other Table Tops, Mural Tablets, &c., in imitation of marble, surpassing the choicest marbles in beauty and durability, at less than half the cost of the commonest descriptions. Price Lists forwarded on application to Mr. MAGNUS, 39 and 40, Upper Belgrave-place, London.

CUCUMBER AND MELON BOXES AND LIGHTS.

One hundred 1, 2, and 3-light Boxes and Lights of all sizes ready for immediate use. Warranted best materials, packed and sent to all parts of the kingdom; 2-light Boxes and Lights from 1l. 4s. Garden Lights of every description, Conservatories, Green and Hot-houses, made and fixed in all parts of the kingdom. References given to the Nobility, Gentry, and the Trade, in most of the counties of England. JAS. WATTS, Hothouse Builder, Claremont-place, Old Kent-road, London.

PATENT WHITE OF ZINC PAINT, as manufactured by J. B. VAUGHAN, surpasses any hitherto made in purity, covering, and drying properties, and is both healthy and disinfecting, so that houses may be occupied without danger whilst painting; it does not change colour even when exposed to the foulest gases. It reflects light to an amazing degree, is unaffected by sea water, sea air, or bilge water; it does not blister, is most suitable for metals, perfectly galvanising iron, while, at the same time, it is economical, covering one-third more surface, and more easily used than the ordinary poisonous pigment made from white-lead.

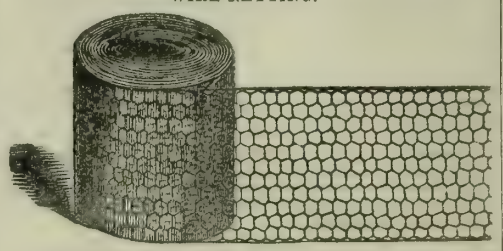
Colour Works and Steam-mills, 56, Stones-end, and Montague-street, Southwark, London.

DR. S. NEWINGTON'S AGRICULTURAL INVENTIONS.—An Illustrated Catalogue, together with a Lecture on the Seeding of Grain, and the after cultivation of the crops, sent gratis, on application to Messrs. DUFAUR and Co., 21, Red-lion-square, London.

OLD FEATHER BEDS RE-DRESSED, AND PURIFIED BY STEAM WITH PATENT MACHINERY. —This new process of dressing not only removes all impurities, but by expanding the feathers the bulk is greatly increased, and consequently the bed rendered much fuller and softer.—Charge for dressing, 3d. per lb. Old and Mothy Mattresses effectually cured and removed, fetched and returned, carriage free, within five miles.—HEAL and SON'S List of Bedding, containing full particulars of weights, sizes, and prices, sent free by post on application to their factory, 196 (opposite the chapel), Tottenham-court-road, London.

TENDERS OF LANDS FOR PURPOSES OF THE METROPOLITAN INTERMENTS ACT, 1850.—THE GENERAL BOARD OF HEALTH, in accordance with the provisions of the 8th section of the Metropolitan Interments Act, 1850, hereby give Public Notice, that they are desirous of receiving Tenders from persons willing to sell Lands for the purpose of establishing Cemeteries within a distance of not less than 6, or more than 20, miles from St. Paul's Cathedral. The extent of such Lands should not be less than 100, or more than 500, acres. They should be of easy access, and the soil should be dry, or capable of being made so by drainage. Other particulars, which will determine the eligibility of sites, may be seen on reference to the recent Report of the General Board of Health on Extra-mural Sepulture. The Tenders should contain the fullest particulars as to the precise locality and nature of the Land, the facilities of access thereto, the tenure on which it is held, the nature of the estate and title of the holder, and the terms on which it is offered for sale. No Tender will be received after a period of six weeks from the 8th of August, 1850. The Tender must be under seal, addressed to the Secretary of the General Board of Health, Gwydyr House, Whitehall, and marked "Tender for Cemetery Lands."

EMIGRATION TO AUSTRALIA.—New Line of Packets from Liverpool. Fine Goods 25s. per ton.



PETREL	...	1200 tons ...	to Sail 10th Oct.
CONDOR	...	1500 ,, ...	,, 10th Dec.

A 1, new Ships, coppered and copper-fastened. For freight or passage apply to the owners,

GIBBS, BRIGHT and Co., Liverpool.

EMIGRATION TO CANTERBURY.—Notice is hereby given, that ASSISTED PASSAGES TO PORT LYTTLETON, in the Canterbury Settlement, will be granted to a limited number of the working classes in the ships Sir George Seymour, Cressy, Charlotte Jane, and Randolph, to sail on the 29th August, being Gardeners, Shepherds, Farm Servants, and Country Mechanics. The Emigrants must be under 40 years of age, of the highest character for sobriety, steadiness, and respectability, as certified by the clergyman of their parish.—Full particulars, with forms of application, may be obtained from JAMES EDWARD FITZGERALD, Superintendent of Emigration, Office of the Canterbury Association, Cockspur-street, London.

STRONG PREMIUM HARE AND RABBIT PROOF WIRE NETTING.

CHARLES D. YOUNG AND COMPANY (LATE W. AND C. YOUNG),
MANUFACTURERS OF IRON AND WIRE WORK, &c.,
22, PARLIAMENT STREET, WESTMINSTER, LONDON;
48, NORTH BRIDGE, EDINBURGH;
32, ST. ENOCH SQUARE, GLASGOW;
1, CASTLE BUILDINGS, DERBY SQUARE, LIVERPOOL;

beg respectfully to call the attention of Landed Proprietors and others to their strong Wire-Net Fence, for excluding Hares and Rabbits from Gardens, young Plantations, Nurseries, &c.

This Net was exhibited at the Show of the Highland and Agricultural Society of Scotland, held lately at Inverness, where its Efficiency, Great Strength, and Exceeding Cheapness attracted general attention, and had awarded from the Judges the Society's Silver Medals, with high commendations.

The immense damage done by Hares and Rabbits in Gardens and Young Plantations is often so great, that in the course of a year or two it will amount to more than the entire cost of protecting them with this Net. It is so durable, that when Plantations are sufficiently advanced to be independent of its protection, it can be removed to other exposed situations with the greatest facility, by any labourer. As a Fence against Hares and Rabbits, it is of itself quite sufficient, having only to be unrolled and attached, with small wire sent for that purpose, to wooden stakes driven into the ground, about every six or seven feet apart. It is, besides, peculiarly adapted for rendering Hedges, Paling, or other existing Fences, *completely impervious* to such vermin; and by being cut up into small pieces of three or more feet, as required, it forms a most efficient guard, at little expense, for individual Plants and Shrubs.

PRICES.—18 ins. high, 9d.; 24 ins., 1s.; 30 ins., 1s. 3d.; and 36 ins., 1s. 6d. per lineal yard.

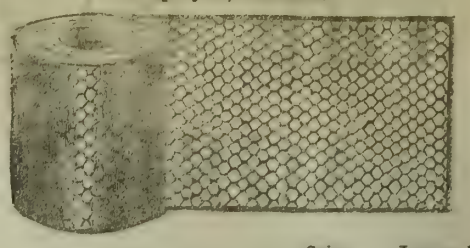
Or a web of 100 yards, 18 ins. wide, will cost	..	£3 15 0
Do. of 100 yards, 24 ins. wide	.. ..	5 0 0
Do. of 100 yards, 30 ins. wide	.. ..	6 5 0
Do. of 100 yards, 36 ins. wide	.. ..	7 10 0

If more or less than a web is required, it would be charged at the same rate per yard.

This Netting is also admirably adapted for Pheasantries and Poultry-yards, and is charged at the same rate. As carriage has, in many instances, been an obstacle to parties at a distance requiring this Net, C. D. Y. and Co. have made arrangements by which they will undertake to deliver it at any of the principal ports of Scotland, England, and Ireland, for One Halfpenny per lineal yard.

C. D. YOUNG and Co. cannot give a better idea of the great strength of their Premium Wire Netting than by stating that the weight of one yard of their 24-inch at 1s. is equal to 2½ yards of another article in the market, the same width, at 9d. per yard. Samples for inspection sent free of expense.

C. D. YOUNG & Co. manufacture every description of IRON and WIRE WORK required for this and foreign countries.



Workmen sent to all parts of Scotland, England, and Ireland.

ALLSOPP'S EAST INDIA PALE AND OTHER BURTON ALES.—In consequence of a very inferior article being now too frequently sold under the name of these favourite Ales, the public are respectfully requested to apply at the respective stores, where a list of bottlers will be furnished, from whom these ales may be obtained genuine, and where also they may be had in casks of 18 gallons and upwards, either singly or in any quantity. Apply to Messrs. SAMUEL ALLSOPP and SONS, The Brewery, Burton-on-Trent, or their Stores, at 61, King William-street, City; Cork-street, Liverpool; High-street, Birmingham; and the Exchange, Manchester.

THE HIPPOPOTAMUS presented by H. H. the Viceroy of Egypt to the Zoological Society of London, is exhibited daily from One to Six o'clock, at their Gardens in the Regent's Park. The Band of the First Life Guards will perform, by permission of Colonel Hall, every Saturday, at Four o'clock. Admission One Shilling, on Mondays Sixpence.

NEWS, NEWS, NEWS.—The best, cheapest, and largest Newspaper in the World.—LLOYD'S WEEKLY LONDON NEWSPAPER contains 60 large columns of the latest intelligence from all parts of the Globe, price only Threepence, postage free. Send Three Postage Stamps to E. LLOYD, 12, Salisbury-square, London, and receive one copy as a sample.

GALVANISED WIRE GAME NETTING.—7d. per yard, 2 feet wide.

	Galvanised.	Japanned Iron.
2-inch mesh, light, 24-inch wide ...	7d. per yd.	5d. per yd.
2-inch ,, strong ,, ...	9 ,,	6½ ,,
2-inch ,, extra strong ,, ...	12 ,,	9 ,,
1½-inch ,, light ,, ...	8 ,,	6 ,,
1½-inch ,, strong ,, ...	10 ,,	8 ,,
1½-inch ,, extra strong ,, ...	14 ,,	11 ,,

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3d. per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

THE TEETH.—How often do we find the human face divine disfigured by neglecting the chiefest of its ornaments, and the breath made disagreeable to companions by non-attention to the Teeth! Though perfect in their structure and composition, to keep them in a pure and healthy state requires some little trouble; and if those who are blessed with well-formed Teeth knew how soon decay steals into the mouth, making unsightly what otherwise are delightful to admire, and designated unhealthiness by the impurity of the breath, they would spare no expense to chase away these fatal blemishes. But although most ladies are careful, and even particular in these delicate matters, yet few are sufficiently aware of the imperative necessity of avoiding all noxious or mineral substances of an acrid nature, and of which the greater part of the cheap Tooth Powders of the present day are composed. It is highly satisfactory to point out Messrs. Rowlands' Odonto, or Pearl Dentrifice, as a preparation free from all injurious elements, and eminently calculated to embellish and preserve the dental structure, to impart a grateful fragrance to the breath, and to embellish and perpetuate the graces of the mouth.—*Ladies' Gazette of Fashion.*

ROWLAND'S ODONTO

Is a white powder compounded of the choicest and most *recherché* ingredients of the oriental herbal, of inestimable value in preserving and beautifying the Teeth, strengthening the Gums, and in rendering the breath sweet and pure. Price 2s. 9d. per box.—Sold by A. ROWLAND and SONS, 20, Hatton-garden, London, and by Chemists and Perfumers.

METCALFE AND Co.'s NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth-Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most extraordinary manner, and is famous for the hairs not coming loose.—1s. An Improved Clothes-Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-Brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh-Brushes of improved, graduated, and powerful friction. Velvet-Brushes, which act in the most surprising and successful manner. The genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE, BINGLEY, and Co.'s Sole Establishment, 130 B, Oxford-street, one door from Holles-street.

METCALFE'S ALKALINE TOOTH POWDER, 2s. per box.

CAUTION.—Beware of the words "From METCALFE'S," adopted by some houses.

THE SUMMER RIDE OR PROMENADE.—The peculiar virtues of C. and A. OLDRIDGE'S BALM OF COLUMBIA completely remove the difficulty experienced by Ladies in preserving their ringlets after exercise; its use so invigorates the hair, that tresses, previously the straightest and most destitute of curl, rapidly acquire a vigour which maintains in permanent ringlets the head-dress of the most persevering votary of the ball-room, the ride, or the promenade. After the Minerals and Vegetables of the Old World have been compounded in all imaginable ways in fruitless attempts to discover so important a desideratum, we are indebted to the Western Hemisphere for furnishing the basis of

OLDRIDGE'S BALM OF COLUMBIA,

the efficacy of which in preserving, strengthening, and renewing the hair has become a matter of notoriety among all civilised nations. Its restorative virtues are indeed a proverb, and the most satisfactory attestations to its infallibility in reproducing hair upon persons otherwise hopelessly bald, have been published from time to time by the Proprietors, 13, Wellington-street North, Strand, a few doors above the Lyceum Theatre on the opposite side.

3s. 6d., 6s., and 11s. per Bottle; no other prices are genuine. When you ask for "Oldridge's Balm," never let the shopkeepers persuade you to buy any other article as a substitute.

ASHBY'S INDIA EXPORT PALE ALE. — London Stores, under the South-Western Railway Terminus, Waterloo-road. India Pale Ale, 21s., 18 gallons; 10s. 6d., 9 gallons; Family Ale, 16s., 18 gallons.—CHAS. ASHBY and Co. invite the particular attention of private Families and Clubs to their PALE ALE, as brewed by them for the COLONIAL MARKETS for the past 20 years. Supplied in small casks direct from the Brewery, Staines, and the London Stores, or from their agents—Messrs. W. Hancock, 80, Connaught-terrace, Hyde-park; Chidell and Stewart, 40, Lime-street, City; W. H. Chaplin, 11, Sebbon's-buildings, Upper-street, Islington; J. Shenton, Greenwich; W. Ferguson, Reading; Thos. Berry, Brighton and Lewes; A. J. Richardson and Co., Portsea and Southsea; J. Skidmore, Rickmansworth; Cooksey, Brothers, Southampton.

TOOTHACHE PERMANENTLY CURED by using BRANDE'S ENAMEL for filling decaying Teeth, and rendering them sound and painless. Price 1s. Enough for several Teeth. The only substance approved by the medical faculty, as being unattended with pain or danger, and the good effects of which are permanent.

Sold by all Chemists in the United Kingdom. Twenty really authorised Testimonials accompany each box, with full directions for use. Sent free, by return for post, by J. WILLIS, 24, EAST TEMPLE CHAMBERS, WHITEFRIARS, FLEET-STREET, LONDON, in return for 13 penny stamps.

CAUTION.—The great success of this preparation has induced numerous unskilful persons to produce spurious imitations, and to Copy BRANDE'S ENAMEL Advertisements. It is needful, therefore, to guard against such impositions, by seeing that the name of JOHN WILLIS accompanies each packet.

SUPERB DOUBLE HOLLYHOCKS.

WILLIAM CHATER begs respectfully to inform the public that his unequalled collection of this magnificent flower is now in bloom, consisting of many thousand spikes of flowers. Free to the inspection of all visitors, whether purchasers or not, on any day excepting Sundays.

Saffron Walden, Aug. 10.

MESSRS. STANDISH AND NOBLE'S new descriptive CATALOGUE OF SELECT HARDY ORNAMENTAL PLANTS is just published, and may be had for four postage stamps. Besides a Treatise on the cultivation of American Plants, it contains a Plate and Description of the Funebral Cypress, Notices of Cephalotaxis Fortunii, Cryptomeria japonica, Quercus sclerophylla and inversa, Viburnum plicatum and macrocephalum, with many recent introductions from the north of China, quite new to English gardens.

Messrs. S. and N. take this opportunity of stating that they give Designs for Laying out New Grounds and Plans for Improvements; also Estimates for all kinds of Planting, whether ornamental or economic.—Bagshot Nurseries, Aug. 10.

NEW LATE STRAWBERRY,
WILMOT'S "PRINCE ARTHUR."

J. WILMOT, in offering this new variety of STRAWBERRY to the Public, is confident that it combines qualities which no other kind at present in cultivation does possess, being of delicious flavour, and coming in after the principal Strawberry season is over. It possesses the property of firmness of texture, so that it may be transmitted to any part of the kingdom without sustaining injury, as it may be kept for several days after being gathered, when fully ripe, without any indication of decay or loss of flavour.

"Prince Arthur" is one of the largest sized Strawberries, and a most abundant bearer; the foliage is small, and never exceeds 6 inches in height; the fruit is consequently fully exposed to the sun. Its dwarf habit requires it to be planted not more than a foot apart. The fruit is perfectly formed, of a rich scarlet, and colouring equally all over the berry. If planted at the distance recommended it will produce double the weight per acre of any other variety.

Strong plants will be ready for sale in September next, at 5*l.* per 100, on prepaid application only, to JOHN WILMOT, Isleworth, Middlesex; Robert Glendinning, Chiswick Nursery; William T. Atwood, Mortlake, Surrey; George Charlwood, Seedsman, Covent-garden; and Messrs. Hurst and M'Mullen, 6, Leadenhall-street, London.—Isleworth, Middlesex, Aug. 10.

HOYLE'S SEEDLING PELARGONIUMS FOR 1850.

CHARLES TURNER will send out, early in the Autumn, strong established plants of the following distinct varieties raised by G. W. Hoyle, Esq. Ajax gained the 4*l.* and Ocellatum the 3*l.* prizes at the Great Seedling Pelargonium Show, Surrey Gardens, in June last, being two of the four prizes awarded on that occasion. Early orders will ensure first selection.

AJAX.—A noble dark variety, smooth, and of fine substance, lower petals rosy purple, top petals very dark purple, with even narrow margin of vivid crimson; very free bloomer; has been justly styled "The leading flower of the season." Price 1*l.* 11*s.* 6*d.*

OCELLATUM.—A great novelty, lower petals bright pink, with a distinct and constant spot of deep crimson; top petals deep crimson spot, shaded off with bright rose, white eye, free bloomer, and good grower. Price 1*l.* 1*s.* 6*d.*

MAY QUEEN.—A large, distinct, and pleasing variety. Orange-rose top petals, crimson blotch, shaded off with orange, the five petals have a delicate margin of pale pink; lower petals vivid rose; large well-defined white eye, very free bloomer, will be a great favourite on the home stage. Price 1*l.* 1*s.* 6*d.*

NECTAR CUP.—Rose, top petals rich orange-rose, with narrow pink margin, clear white eye, fine substance, good habit. Price 1*l.* 1*s.*

FLAVIA.—Orange-scarlet, the brightest in this class that has been offered, and makes a fine display on the stage, rather crumpled on the edge, and lower petals too long. Price 1*l.* 1*s.*

GENERALISSIMO.—Large and very attractive; lower petals salmon, with spots of a deeper colour, white centre; top petals very dark, rich, and velvety, shaded with lively orange, occasionally crumpled on the edge. Price 1*l.* 1*s.*

RUBIOLA.—Fine crimson scarlet of beautiful texture, dark spot on the top petals, rather deficient in breadth of petals. Price 1*l.* 1*s.*

CORINNE.—Light purple, very smooth and free bloomer, dark top petals. Price 15*s.*

ISIS.—A neat smooth flower, of good quality, very free bloomer, rose with white eye, and dark blotch on top petals. Price 15*s.*

CARDINAL.—Fine rich orange crimson, black blotch on top petals, very smooth, not a strong grower. Price 15*s.*

HEARTSEASE.—Scarlet rose, large fine shape and substance; but being inconstant, purchasers of the above will have a plant without charge.

Price 8*l.* 10*s.* for the set.

Royal Nursery, Slough.

SEEDLING PELARGONIUM—"PRINCE ARTHUR."

A. PONTEY begs to announce that he will send out, on Monday, the 14th October, at 1 guinea each, or four plants for 3 guineas, his seedling Pelargonium, for which the highest prize, the Silver Medal, was awarded at the Exhibition of the Royal Devon and Cornwall Horticultural Society on the 16th May; also a certificate of merit was awarded at the Devon and Exeter Exhibition, on the 24th May, and a certificate of merit at Torquay Exhibition on the 6th June.

The Splendid Pelargonium is thus described in the "Floricultural Cabinet," July:—"Upper petals large, dark clouded blotch shaded off to flesh colour, lower ones flesh colour, centre white; petals of firm substance."

Mr. Glenny's opinion of its habits and the peculiarity of its white throat, which he affirms is "purer than that of any one of the present varieties," has been given in the Country Gentleman, weekly garden newspaper.—Aug. 10.

WILLIAM YOUNG begs the attention of Noblemen, Gentlemen, and Planters in general to inspect his extensive collection of CONIFEROUS PLANTS, consisting of Araucarias, Deodars, Douglasii, and all the leading kinds, from 1 foot to 10 and 15 feet high, with Cryptomeria japonica, bearing perfect cones.

Milford Nursery is one square piece of ground, about 30 acres, on a particular dry and healthy soil, filled with the most choice kinds of Ornamental Trees, Shrubs, and Forest Trees of every description; Ash, Birch, Chestnut, Hazel, Willow; Scotch, Larch, Silver, and Spruce Firs; and other hardy Forest Trees, being planted for sale by the 100,000, whence they transplant equal to, if not better, than any other nursery in England.

Milford Nursery is two miles from the Godalming Station of the South-Western Railway, where conveyances are always in attendance.

BAKER'S PHEASANTRY, Beaufort-street, King's-road, Chelsea, by special appointment to her Majesty and H. R. H. Prince Albert.—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shovellers, gold-eyed and dun divers, Carolina ducks, &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied, and common pea-fowl, and pure China pigs; and at 9, Half-moon-passage, Gracechurch-street.

"THE FLOWER OF THE DAY."

J. AND C. LEE beg to announce that they are now sending out their beautiful new Variegated SCARLET GERANIUM "THE FLOWER OF THE DAY." It is of extremely free habit, and constant variegation. Price 10*s.* 6*d.*; discount to the Trade when three are taken. May be had of the principal Nursery and Seedsmen.

Nursery, Hammersmith, August 10.

The Gardeners' Chronicle.

SATURDAY, AUGUST 10, 1850.

MEETING FOR THE ENSUING WEEK.

COUNTRY SHOW.—Thursday, August 15: Birmingham Botanical and Horticultural.

A GARDEN is an excellent school for patience. Disappointment is often the end of the labour and hope of years; and, as in more important matters, frequently takes place exactly where it is most keenly felt. There are few cases, however, where honey may not be gathered from the lion's carcase, if it be looked for; the misfortune is that so few people look for it, or when it is found, profit by their experience.

A few days since, just after the late storms, a beautiful standard Rosa Brunoniana, which was an especial favourite, was observed to fail all at once. It had borne a profusion of blossoms, which were indeed scarcely over, and had made new shoots 3 feet in length, looking as flourishing as any species could well look in a thin and rather arid soil. There was no appearance of disease or decay about the stock; the junction of the bud and wood was singularly healthy, and new wood was in progress, vigorous and abundant. There were many voices in favour of its sudden destruction being due to lightning, a cause to which many a dead branch or tree is ascribed without a shadow of reason. It was remarked by a little boy who was standing near, that when this and another tree received from the same quarter were planted, a thin white pellicle of fungus was observed about the base of the stock, and that a notice of the appearance was made at the time and forwarded to the intelligent cultivator who had supplied the trees, as possibly suggestive of some disease with which his stocks might be affected. The tree was accordingly dug up, and the evil was at once sufficiently visible. The bark was much thicker at the base than usual, soft, and much decayed, and split into plates by interposed layers of white byssus-like spawn, which had at length destroyed all connection between the stem and root; and probably in consequence of the marked transition from dry to very moist weather, had completed its task with great rapidity, so as to make the failure at last appear absolutely sudden.

Occurrences of this description are not unfrequent amongst standard Roses, so much so that many persons object to grow any which are not raised from cuttings or layers. The evil we believe in most cases arises from the use of stocks procured from the woods and hedges. The roots in this case are seldom in a healthy condition from the first, and they are very liable to injury in removal; and even when they seem for a time to flourish vigorously they not unfrequently fail, even before they are budded. The decay of standard Roses sometimes undoubtedly arises from imperfect union between the stock and bud, or from the extensive decay of the upper part of the stock, which acts injuriously upon the young wood thrown out by the bud; but more generally, we believe, it is due to the bad condition of the roots or the base of the stem from which they spring. The wiser course seems therefore to be, not to trust to ready-grown stocks, but to raise them in the garden, for which great facility is offered by the rapid growth of the Rosa Manettii; and it is some consolation to the cultivators of these most lovely flowers, that a large portion of the Roses which are now raised to such a marvellous extent are worked on nursery stocks.

Another grand point is to procure the plants at once from the growers. Rose trees are seldom healthy where they have made two or more journeys, and have perhaps been transplanted more than once after their first removval. At least, our experience is strongly in favour of those which have not passed through any intermediate hands.

THE effect of the coming EXHIBITION OF ALL NATIONS has begun to be felt even in the horticultural world. We have reason to know that clever persons are already devising improvements in the manufactured articles employed in gardens; enquiries are making about portable houses, glass cases, window gardens, ventilating mechanism, border-edgings, garden sculpture, and a crowd of things which are or would be in great demand. Gardens near London are undergoing alterations likely to increase their attractiveness, and even societies are bestirring themselves in earnest to meet the wants of the crowds of strangers that may be expected to throng the metropolis.

Acting in this spirit the Horticultural Society has just reduced the admission fee of members from six guineas to two guineas, in order that no money impediment may be offered to those who wish to join it. Its Council has also decided that for next year the number of privileged tickets (at a low price) which each Fellow may procure shall be increased from 24 to 48, the effect of which is to give a bonus of 3*l.* 12*s.* per annum to each Fellow who may require tickets for himself or others; and we have reason to know that it is in contemplation to grant further privileges of substantial value to the Fellows. It is decided too that, as the exhibition in Hyde Park will be opened on the 1st of May, the first meeting of this great society, at Chiswick, shall take place on the succeeding Saturday, so that English gardeners may have the best and earliest opportunity of showing the crowds of foreigners who will then be in London, what can be done by English industry, skill, and wealth. This is perhaps the best time in May for out-door meetings; the earliest days of that month being usually the finest until the end is approached. In fact we find, upon looking to the weather registers, that in 25 years five days only have been wet, while 16 have been beautifully fine.

We observe too that notice of agricultural produce to be sent to the exhibition in Hyde Park, has already been given in foreign journals. *La Presse*, of Aug. 2, speaks of some marvellous Wheat obtained by the Messrs. DUSSEAU, by steeping the seed corn in some new preparation, which Wheat is destined for the purpose. The magnificence of this corn, both in straw and ear, is represented as having excited universal admiration; and it is expected "to do the greatest honour to French Agriculture."

THE spread of scientific information on the subjects of Botany and Floriculture may be regarded as a characteristic of the age, and is a pleasing token of advancing civilisation. During the last 20 years floral literature has certainly increased in more than arithmetical ratio, and has more than kept pace with the extending population of Great Britain. More books relating to gardening are now published, and the information conveyed is more rational and solid, relating more to first principles than to mere empiricism. Knowledge of this kind is further simplified and spread abroad by public lectures, and also by horticultural societies; for although the exhibition of well-grown plants has in itself not much to do with the *rationale* of their production, enquiry must be excited by such means, and at such public gatherings it may be presumed scientific questions are often illustrated and discussed. A demand is created for the results of a more perfect art, which can only be met by the application of an increased acquaintance with science.

But while there is just cause for congratulation *relatively*, it will be found that the real amount of philosophy among unprofessional gardeners is very small, a fact which may be easily verified by a little personal enquiry, as well as by an inspection of the actual condition of the gardens of the masses of society. In the great majority of cases the commonest scientific principles are totally unknown, and, as the result of this, an amount of labour sufficient to make a plot of ground both useful and ornamental is almost thrown away. "In the suburbs of London," writes a correspondent, "where I now reside, I am both amused and vexed by the abortive efforts of my neighbours in cultivating their gardens. Some are continually watering until the soil has a surface as smooth and hard as a slate; others altogether neglect the aptitudes of their plants for sunshine and shade; and a third class, like little children, are always putting in slips of things which never grow by such a procedure. All this is the more provoking, because the occupants often are really generous of their time and money, labouring much with their own hands, and purchasing freely of itinerant vendors various plants in season. How much good 'PAXTON'S Cottagers' Calendar' would do such people!" From the same source we learn that in a town of 8000 inhabitants, which boasts of a Horticultural Society, not one copy of any Gardening newspaper is taken in, and none of the members of the said Society cultivate any acquaintance with science. We have no doubt that in most of the instances in which tolerable success attends gardening exertions, it is to be attributed to long practice, which has gradually and painfully secured the results of a more correct information.

As we have not the ear or the eye of those who are so much behind in floricultural knowledge, it may be thought our observations are out of place, like the public reproofs of a preacher for non-attendance, which assail the wrong persons, the offenders being absent. But our design is practical, for we wish to remind our readers that, like the radiation of heat, knowledge must pass from those who have it to those who have it not, if its genial influence is ever to be generally diffused. That

more happiness would be the result of such a circulation of scientific principles cannot be doubted, for if men will labour with pleasure in spite of the failures which attend their ignorance, how much more gratified would they be if their exertions were regulated by sound knowledge?

HOW TO MISMANAGE A GARDEN.

Chapter I.—In this age of admirable gardening it is to be feared that the art of mismanagement may be altogether lost sight of. That event, if it should ever come to pass, would be attended with such serious inconvenience to a large body of ingenious persons that it seems desirable to place on record the main features of mismanagement before they shall have wholly faded from the memory of man.

It cannot be denied that half the pleasure of active life consists in the variety of incident which attends it; nor will any one dispute the maxim that those results are most highly prized which are most difficult of attainment. Obstacles are the charm of enterprise, just as contradiction is the life of argument. It is admitted on all hands that what is won easily is not worth winning, just as what is done easily is not worth doing. The gambler who never loses finds his gaming dull work; and nobody would care to be a scholar if learning came as easily as eating. The fondness of the world for riddles and puzzles of all sorts arises wholly out of the difficulty of explaining them; and in like manner the rage that once existed for writing what were called Witches' prayers, which equally made sense, whether read backwards or forwards, excepting that they cursed one way and blessed the other, was entirely excited by the extreme difficulty of the task.

In the same way much of the charm of gardening consists in its difficulty; we value the results quite as much on account of the trouble they have cost us, as for themselves when we have gained them. This is shown every day in the value attached to seedlings. A man sows a seed; raises the young plant through all the dangerous periods of its existence; pots and repots it, nurses it with warmth in winter, and feeds it with the nicest manure in summer; spends years in watching it; at last obtains a flower or a fruit; and is charmed at so satisfactory an issue to his experiment. Not that the result has any real value; for he probably could buy something twice as good, for sixpence, in the nearest nursery. But no interest belongs to buying a plant for sixpence; it is an operation without difficulty or trouble; on the other hand, the seedling was obtained with care and pains, and by overcoming difficulties; and these things stamped it with value in the mind of its possessor.

For such reasons it seems advisable to point out in what manner the facility and certainty with which gardening is carried on by some of our horticultural luminaries may be most conveniently diminished. Our pleasure will be gone, if to hire a man and a piece of ground is to be the same thing as to have beds full of flowers, and houses full of fruit, and a kitchen-garden crammed with eatables. It must be owned that things are looking that way. If people mind what is said by the writer of the "Calendar" in the *Gardeners' Chronicle* it must be so; and to that a true lover of gardening cannot do otherwise than object. If our gardens are to be no trouble, if our gardening is to involve neither risk nor uncertainty, then the market will supply men's wants, and the happy amateur will sink into the misery of what some call *ennui*, but which may be better designated as nothing-to-do.

There are books without end telling, or professing to tell, how to manage well; we have "Theories," and "Hand-books," and "Guides," and "Manuals," and "Encyclopædias," all aiming at perfection. But there is not, in the whole of gardening literature, one single work that ventures to point out the usual modes of managing ill; such an omission cannot but be regretted by all votaries of the pursuit of success under difficulties; and it is to be hoped that in the course of the following dissertation, this defect will be remedied; in addition to which it will be found to contain a full explanation of the famous case of the golden sleeper, whose history is thus reported in the *Spectator*:—"I believe you will think it a very extraordinary circumstance for a man to gain his livelihood by sleeping, and that rest should procure a man sustenance as well as industry. Yet so it is, that Nicholas got last year enough to support himself for a twelvemonth. I am likewise informed that he has this year had a very comfortable nap. The poets value themselves very much for sleeping on Parnassus, but I never heard they got a groat by it. On the contrary, our friend Nicholas gets more by sleeping than he could by working, and may be more properly said, than ever Homer was, to have had golden dreams. Juvenal, indeed, mentions a drowsy husband who raised an estate by snoring; but then he is represented to have slept what the common people call a dog's sleep; or, if his sleep was real, his wife was awake, and about her business."

But this is not the only reason why mismanagement deserves a special study. What will become of the shoals of men who understand nothing else, if the good old customs on which it is founded are to be abolished? Are they, too, to be deprived of protection? The thought is monstrous. Victims enough are said to have been sacrificed in the march of modern innovation; thousands of poor stragglers are mentioned as having dropped out of the line, and perished by the road-side, only because they had not strength and courage enough to keep up with the stoutest of the throng. It will never do for gardeners to be treated thus. They must be protected, and their mismanagement must be protected also, or they will be left to starve, while the enemies of mismanagement, those horticultural free-traders, grow fat in their places. They must be protected for their own sakes; they must be protected for the sake of the peace and comfort of their employers. It will be shocking if the vexation and annoyances which often attend the possession of a garden should disappear; for as has been just shown, those vexations and annoyances are the very foundation of pleasure and comfort. Therefore it is that the writer of these notes, himself experienced in all such matters, proposes to point out, in many succeeding chapters, the most approved principles on which the greatest possible amount of mismanagement may be attained by all classes of the gardening community.

TOADS AND THEIR SKINS.

Referring to the accounts given by Prof. Henslow, in pp. 373 and 422, of the mode in which toads shed and afterwards dispose of their skins, I wish to add my mite of experience. A few years ago, it may be 10, wishing to ascertain for myself whether toads were indeed venomous—and if so, where; and whether they spit, and if so, how—I collected about 25, and kept them in a shallow wooden tub, lined at the bottom with thick sods of Grass. At this time toads were to me the most disgusting of animals, and I dared not handle one for the world.

It was not long before I satisfied myself that they could not spit; and that, in regard to venom, they had, at least, no power of ejecting any from any quarter, as I had been led to suppose; for I remember a gardener once telling me that in moulding up a trench of Celery, a toad hopped away and voided something upon his hand, which inflamed it very severely. I found, indeed, that in damp weather they would, if disturbed or handled, void a clear fluid *ab ano;* but I can vouch, both by touch and taste, frequently repeated, that the ejaculated fluid was as tasteless and harmless as distilled water. Neither could I ever discover that the toad at any season of the year could put forth any secretion from the glands about his head and eyes. A little pressure will force out from those parts a kind of cheesy-creamy matter, which is acrid; and I remember my brother once squeezing the glands rather severely with a pair of pliers, when a small quantity spirted into his eye, and produced a very severe smarting which lasted some time. Probably it is this acrid substance which causes the pike to reject a toad, and which produces that maddening effect on cats which I have heard and believe takes place when they happen to seize one.

I had not kept my toads long before I grew attached to them. They were no longer the loathsome creatures I at first thought them, although still confoundedly ugly; and I grew to handle and fondle them with the greatest confidence and affection. They got to know me, and instead of shrinking into their little "forms" on my approach, as they had been accustomed to do, they would take the insects which were thrown to them without regarding my presence. I may here observe that I never saw a toad take dead food, nor seize anything that was not in motion. So long as a beetle or earwig was content to be still it was safe; but as soon as ever he stirred he was a dead man. Although, generally, a toad will lie in his hole, and seize only such insects as approach near enough to come within reach of his unerring tongue, yet if they have been on "short commons" for a few days, they will condescend to come out a step or two at sight of their game; and it is curious to see a toad stretching out of his den with foot uplifted and eyes right, for once putting on a sagacious, wide-awake look, in order to nail some unwary truant of a beetle, or "old sow." Whenever he strikes his prey the toad makes a noise like the smacking of lips, which, for ought I know, may have led people to suppose he occasionally indulges in the vulgar habit of spitting.

But in describing some of the habits of the "loathed Paddocks," as Spenser calls them, I had well nigh forgotten the particular point about which I intended to write. I kept my 25 toads for nearly two years, and during that time I saw the process of skin-shedding and skin-swallowing at least 50 times. The process is very much as Prof. Henslow describes it. First, a splitting down the back, which is soon perceived by an unusual brightness of colour and moistness; then, after sundry and divers contortions, the skin gets drawn down to the legs, which the toad "peels" very cleverly. I have seen them put a hind leg under the arm, and then withdraw it while the arm is held close to the side, by which means the stocking is gradually slipped off. I have then seen them with their feet "coax" the skin along the abdomen, up towards the mouth, and the operation mostly, but not always, ended in a gradual sucking down of the cast-off cuticle. It always struck me that the swallowing down of the cuticle depended on the fact, that the mucuous lining of the mouth was continuous with the outer skin, and that, consequently, when it reached the lips, it was only natural for it to roll inwards to the gape, and that, once in the toad's mouth, down it went. I have also noticed that the toad is very quiet and mopish for a day or two before losing his skin, and (for a toad) unusually brisk and lively after he has got rid of it. In the hot weather I think the operation would occur as often as once in six weeks; but, as I had so many toads in one place, I do not wish any reliance to be placed on this impression of mine. I once saw a large toad strike at and take a very young toadling, and ultimately swallow it; but it was evidently a practice he had not been much used to, as the feet of the hind legs projected out of his mouth for several hours. Neither do I think this solitary instance of what a toad in confinement and on short commons may do, should be made use of as any proof that the toad in a state of liberty and nature would be guilty of any such criminal practices.

The consequence of the want of teeth in the toad was often shown when large worms were given them, which would often creep out of their mouths in spite of the most determined efforts to gobble them. This I never noticed in a frog, who always "made sure of his man" when once he got fairly hold of him. This passing allusion to the frog induces me to add that I also once kept a menagerie of these creatures, which, when compared with toads, both in their slimness and agility, reminded me forcibly of nimble Frenchmen. (Why should Frenchmen be called *crapauds?*) I have often seen two frogs at the same moment seize hold of the opposite ends of a large worm, and swallow each a half until their mouths met; then they would pull and tug against each other with might and main, and at last stand up on their hind legs and wrestle in the most grotesque and ridiculous way imaginable, until at last one of them dragged the poor unhappy worm clean out of the other's stomach; and then, after such a bout, I have seen, *mirabile dictu*, the defeated frog hop up to the other as he was greedily gulping the abstracted moiety of the writhing worm, and snap at him in the ribs with his mouth, *comme un chien*. I used to keep my frogs under a hand-glass, with a moveable top, and I have occasionally turned in two or three of the common white butterfly, which the frogs would jump at and capture from the top of the glass.

There is one other curious fact connected with the natural history of the frog, which is germane to the subject of this communication—frogs shed and swallow their skins like the toad. I never saw the operation; but being once desirous of ascertaining upon what food wild frogs fed, I caught and killed one, and, in turning the stomach inside out under water, I observed, amongst a lot of small snails and insects, a curious filmy body which I could not at first make out; but after shaking it in the water I found, to my astonishment, a bit of it fingered, like a lady's glove, and soon after I discovered the strange thing was neither more nor less than the entire skin of a frog. May I not say of the frog, and if so, is not the inference irresistible, that frogs do shed and swallow their skins like the toads? *William Marshall, Ely.*

Home Correspondence.

Veronica speciosa, var. Kermesima.—I send you a specimen of a very pretty seedling variety of the well known Veronica speciosa, which I think merits the name I have given it. It is perfectly distinct from the parent plant, and the colour is brilliant in the full sunshine. It is growing in my shrubbery border, where, with many others, it has survived the last inclement winter, which it passed uninjured. The recent introduction to the floricultural public, by the Messrs. Henderson, of a hybrid between V. speciosa and Lindleyana, induces me to think that a still more distinct race might be originated between V. speciosa and V. decussata, which blooms freely in this neighbourhood, where it is known as the Botany Bay Myrtle. I have, however, been seeking in vain for a stray flower or two with which to make the experiment, the blooming season being towards the end of May, so that speciosa must be brought on in heat to effect the union. My research led me to measure one plant that came under my notice, and I found it exactly 16 feet in circumference. It is growing in the narrow strip of garden in front of a cottage occupied by a boatman in the Preventive Service, very near the edge of a cliff, but sheltered by the house from the tempestuous south-west gales, which are our chief enemy, and which in the romantic little hamlet of Hope blow with tremendous violence. *A Devonian.* [The variety sent with this was charming, a decided rose-colour having mingled with the violet.]

Polmaised Grapes free from Mildew.—In your last Number there is a woeful account of damage done to Vines by mildew, where some modification of Polmaise heating has been used. It is not so here, where I built a Grapery in the autumn of 1848, 38 feet long and 14 feet wide inside; roof sashes glazed with Hartley's patent rough plate glass, and heated by a modification of Polmaise, by which I obtained a centre pit 24 feet long and 5 feet 6 inches wide inside measure, resting

on the smoke flues, and covering (except at each end) the hot air passages. On April 26th, 1849, I planted nine Vines, then about the size of goose quills—two of Chasselas Musqué, two of Josling's St. Alban's, and five of Black Hamburgh, one to each light. I commenced forcing on 15th March last, and cut well ripened Grapes on the 13th July, when Mr. Knight, of Chelsea, was here and expressed his surprize at the produce, the growth and healthiness of the Vines. I suffered each Vine to bear only 6 bunches, and I caused more than 100 bunches to be taken off before blooming. There now hang about 40 bunches of dead ripe fruit. Besides Grapes I had a splendid early crop of French Beans in the pit, and now most luxuriant and healthy Cucumbers, and hope to have Asparagus in the winter. *John Cox, Clinton House, Weybridge.*

Bursting of the Fruit of Melons.—I grow Melons in a wooden frame in the old-fashioned way, the heat being kept up by repeated linings. The earth is turfy loam about 2 feet deep; I water just sufficient to prevent the plants from flagging under the heat of the sun. The crop this season is fine, but just as the fruit begins to change colour it bursts and rots. To all appearance it is sound, but when you touch it you find it as thin as paper, and in a regular ferment inside, the pulp being in a liquid gruel. The plants are quite healthy. Air is given every day; in short, nothing exceeds the healthy appearance of the plants. What can be the matter? *Zero, Hatfield, Essex.* [We hear of other cases like this. The cause of the fermentation is unknown, but is probably connected with over-watering or unskilful watering.]

The Cuckoo.—I have heard the altered note of the cuckoo, mentioned by your correspondents, frequently I think during the last three or four years. The bird sometimes calls merely "cuck," at other times, "cuck-cuck, cuck-oo." I certainly do not remember to have noticed it before the last three or four years, though I think it very probable that it has been heard and not considered remarkable both by myself and others. The most probable explanation to me appears to be that the bird is disturbed at the moment it commences its call, so as either to be frightened out of its second notes, and thus either leave off or begin again. I certainly heard this double note this year, the first week the bird arrived in this country. Of course the young cuckoo of the year does not call the year of its birth at all; it hardly leaves the nest before its parents are gone. I have this year heard the cuckoo several times very close, say 10 yards, when I have been in the woods, and have heard what I do not see noticed in books, viz., that after the call-note there ensues a loud guttural sound, which appears as though the bird were drawing in air into some receptacle in the throat. Should this inhalation be necessary for the utterance of the perfect sound, then we can easily imagine that a deficient inspiration would cause a defect in the note. *C. R. Bree, Stowmarket.*——I have noticed all the variations of note mentioned by your correspondent every season for the last 50 years. The first 46 years of my life were spent near Bury, where the country is hilly. The last 16 years I have lived here, where the country is low and flat. My occupations lead me, every season, into various parts, both of this county and Cheshire. Now, I find that the cuckoo sings more frequently, longer in the season, and the birds are more numerous, and have a greater variation in their notes, in a hilly district than in a low flat one. It is the same with the skylark. With the blackbird it is just the contrary, in every respect. The thrush (Turdus musicus) sings longer, more frequently, and is more musical in a hilly district, but they are more numerous in a flat one. This bird never leaves here in the winter season. From hilly districts it emigrates in that season. I have heard the cuckoo and the lark sing at midnight in June, in the glens, amongst the hills, north of Bury. *W. Rothwell, Winwick.*——Ten or eleven years ago a cuckoo was heard in this neighbourhood, whose note at the first coming and during the season was "cuck-coo-oo." It was heard by many, and noticed for its peculiarity; the next spring the same note was heard in the same locality, and probably from the same bird. Having removed from this place, I heard no more of it till I returned again; and, in the spring of 1849, I heard the same note again, in the same locality. This spring it has not been heard, from whence I conclude the bird is dead. *Lusor, Bristol.*

Scientific Nomenclature.—I have read with interest your articles on the folly of introducing into all science a foreign nomenclature, taken too from the dead languages. I am an M.A. in the University of Oxford, but I am not acquainted with a single science, because whenever I attempted to learn from the most elementary book I found the terms were conveyed in a language which would require a Greek lexicon and a Latin dictionary, as of old, to translate. Let us have an encyclopedia of all the sciences written in English. Let me learn from your pages where I can teach myself and my children botany and the other sciences in English. Let us have English, the common spoken language, as far as we can. But I have a greater progress in knowledge to propose, the adoption of a universal language, which should do away with a variety of terms for things, and make signification complete to all. The academies of Europe, the Royal Society of England, and the universities should meet for the purpose. Once formed, Government should patronise, commerce should adopt, schools should teach the new language. All books of all languages should be translated into it. All new books would be written in it. Money, measures, weights, characters, and short-hand writing should also be common. It was the idea of Turgot and Condorcet. *A Subscriber, Oxon.*

The Night-blowing Cereus.—Some short time since I witnessed, in the gardens of the Earl of Poulett, at Hinton St. George, a sight which may interest and surprise your readers, viz., 21 blossoms out at once on the Night-blowing Cereus, a number, I should think, unheard of before. Six more blossoms have, at intervals, been out since. Considerable credit is of course due to Mr. Newson, the Earl's gardener, who, from his civility to parties who were kindly permitted to see the plant, I have no doubt would give any information in his power with respect to its culture or habits. *Clericus.*

Answers to the Puzzle.—Is "Anona" the name of the tree? *Amelia Cumming, Cambridge.* — Perhaps Acacia. *Wm. Brownlees, Hemel Hempstead Nursery.* —Is Coffee the name of the tree—thus, Kaw-phy. *J. G.*

Profit of Uniting Bees.—Mine have gone on increasing for the last few years, until I am now compelled to do something with them, having upwards of 30 hives. I have two on White's plan, and this is the first year they have not swarmed; the side boxes are well filled with honey, but contain some brood. I have also two on Saul's principle, both of which have swarmed, and without having given any intimation of their intention to do so. This is a serious objection, and applies to White's also. Unless they are well watched, the swarms are frequently lost. My remaining stock are all in common straw hives, and I prefer them for every reason but that of being compelled to destroy the bees to obtain the honey. I have united a few hives, but imagine the greater part leave the hive again, or are killed by the other bees. I found them no stronger in the spring, neither did they swarm earlier. Is it therefore better to use the match than unite? *Ignoramus.* [The uniting of stocks is all very well as a curious experiment, and to show your mastery of bees, but it is rarely profitable. It is different in the case of second swarms; then the best course is to cause them to return to the parent hive, by throwing them out on a cloth and removing the queen early in the evening of the day on which it swarmed. There is a description of a straw hive, at page 264, of No. 17 of this year's volume, which would suit your views. It would be better to select as many of the best stocks in the common straw hives, the third week in this month, as you wish to have swarms next year, the swarms of which should be hived into hives similar to that described. In selecting, the very light or over-heavy stocks should be those destroyed for their honey. *Y.*]

Potato Disease.—Many of the plants of both early and late Potatoes are very much diseased. The leaves and stems assume a blackened rotten appearance. The tubers themselves are in many instances already affected. *E. C. Nunn, Secretary to the Diss Farmers' Club.*——The disease is making rapid progress in all directions in this neighbourhood. Within these last few days, large patches of the haulm have become quite black, and the tubers are more or less affected; it appears to be equally virulent on dry sandy soil as in the more damp localities. *W. Mountford, The Gardens, Marden-park, Godstone, Surrey, Aug. 5.*——The Potatoes in this neighbourhood (Winchester) and many miles round are in appearance truly miserable—not a green leaf to be seen; a large quantity of the tubers is infected, particularly those which are near the surface. I first, about three weeks ago, saw the appearance of disease in three rows, about 20 yards long, which were planted last September without manure. I never saw it spread with such rapidity before. My Potatoes being full grown I will take them up very carefully, lay them in beds on the ground where I dig them, 3 feet wide and 18 inches high, bringing them to a sharp ridge at the top; cover them with mats at night and on wet or damp days, until they are well dried, but not greened over, nor suffered to lay until they become strong or hot tasted. I will then store them away into a dry close room, where they kept well last year the whole winter—I might say until Potatoes came again. *Subscriber.*——The late Potatoes are magnificent in growth and blossom; but disease has slightly appeared in the early sorts. *A Devonian.*——The Potato disease has made its appearance here (north of Bristol) rather severely, and seems rapidly on the increase; where it has attacked the tubers, they are soft and rotten. A small plot of Axbridge Kidneys was attacked on Friday last with the grey spot in the haulm. I took up some plants and found the tubers quite sound. I immediately had the stalks cut close to the ground, and the earth drawn over. The Potatoes were not fully grown, and I expect will not increase in bulk; but I anticipate they will acquire more firmness, so as to fit them for storing for winter use; when the rows were earthed up, they received a good dressing of salt. *Lusor.*——The disease has reappeared in almost every parish in this quarter of the county, with more or less severity, in proportion as the sets were planted early or late; and I cannot learn that any description of Potato is free from it. Even the Forty-fold, which has hitherto been a fortunate exception, now shares in the general infection. The symptoms first appeared about 10 days ago in the usual manner, that of dark spots on the outer surface of the leaves, the inner appearing mildewy, and within a very short time the haulm became decayed. My Potatoes, the Forty-fold, being planted early, in February, I had hoped were secure; but not so. Immediately on detecting the plague-spots, I cut off all the haulm close to the ground, in order to dry the ridges, which, in consequence of the late heavy rains, were saturated with moisture, and when the earth appeared dry enough, I took the tubers up, as they were perfectly ripe. Out of a dozen sacks, I cannot find a single defective tuber. I am told that I have made a great mistake, and shall suffer for it. Is such your opinion? *H. S. Templer, Cuxham Rectory, Totsworth, Oxon, Aug. 6.* [No; not if the tubers are really ripe.]——The week before last the sky was heavy with clouds charged with electric matter. There was one very heavy shower of rain, and some heavy hailstones mixed with it. There were several peals of thunder occasionally heard, but no regular thunder-storm. The Potatoes immediately began to be affected, in patches here and there through the fields. The plague has not as yet gone to any extent; but, though not so rapid in its effects as in former years, it is as general immediately around me. *Cavan, Ireland, August 5.*—Since I wrote to you last week, the disease has been rapidly increasing in its virulence, and the worst fears with regard to the crop must be entertained. Many persons think that it will be more fatal this year than in any preceding one. People are digging them up, and sending them to the market, where they are sold at 2*d.* per gallon. This will occasion a scarcity hereafter. *W. Watkins, Chichester.*

Societies.

HORTICULTURAL, *Aug. 6.*—Dr. JACKSON in the chair. It was resolved upon ballot that in future the admission fee shall be two guineas instead of six guineas. Among subjects of exhibition, that which excited the most interest was a collection of Hollyhocks in spikes and single blooms from Mr. Chater, of Saffron Walden. The kinds consisted of Attraction, light ground, beautifully veined; Atrosanguinea, dark crimson; Black Prince, one of the darkest of Hollyhocks; Coccinea, bright red; delicata, French white; formosa, claret; Magnum bonum, maroon; Model of Perfection, white; Napoleon, red and buff; purpurea elegans, purple; Queen, blush; rosea grandiflora, pink; improved varieties of rosea alba, Snowball, and Wellington; sulphurea perfecta, sulphur; Comet, ruby red; pulchella, exquisitely formed rose; Mr. C. Baron, delicate salmon; Elegans, blush; and Commander-in-chief; the latter with a flowering spike at least 3 feet in length. The same grower also produced some nice seedlings not yet "sent out," among which was a kind named Walden Gem, certainly an improvement on Comet in point of colour. A Banksian Medal was awarded.—A collection of 24 varieties of Hollyhocks in the shape of single blooms—a bad way of showing them—was also contributed by Mr. Bragg, of Slough.—Mr. Franklin, gr. to Mrs. Lawrence, of Ealing Park, sent an exhibition of Orchids, for which a Banksian Medal was awarded. It consisted of examples of Angræcum caudatum, Cattleya crispa, Oncidium incurvum, Burlingtonia candida, Dendrobium formosum, Aerides quinquevulnera, Miltonia spectabilis, Anguloa uniflora, a species of the genus Eulophia, and one or two other plants. —A Certificate of Merit was awarded to Mr. May, also of Ealing-park, for a well-managed example of Ixora coccinea. — Mr. Spencer, gr. to the Marquis of Lansdowne, at Bowood, sent a long conical Enville-shaped Pine-apple, named Black Prince, a red coloured kind, about which little at present is known. It weighed 11 lbs. 11 oz.; but Mr. Spencer stated that, under better cultivation, this kind of Pine-apple might be expected to produce fruit much heavier than the one sent, which was the production of a small plant, and but imperfectly swelled. It was not cut up, and therefore no opinion of its quality could be formed. A Banksian Medal was awarded it.—Mr. Jones, gr. to Sir J. Guest, Bart., sent five beautifully ripened Ripley Queen Pines with small crowns, the heaviest 6 lbs. 4 oz., and the lightest 5 lbs. ½ oz.; and along with them an ill-formed cockscomb-crowned Providence, weighing 11 lbs. 11 oz. A Knightian Medal was awarded for the Ripley Queens.—H. Judson, Esq., of Brighton, communicated some handsome specimens of his "Richmond Villa Black Hamburgh" Grape, which has been exhibited before; and Mr. Ferguson, of Stowe, fine looking Peaches and Nectarines, for which a Banksian Medal was awarded. They had been ripened without the aid of fire-heat.—A fruit of the much-esteemed Bromham-hall Melon was sent by the raiser, Mr. Bundy, gr. to Lord Dynevor. It weighed 2 lbs. 11 oz. —Mr. Fry, gr. to Mrs. Deal, Lee, Kent, showed a useful contrivance for sulphuring trees, plants, &c. It is on the same principle as Brown's fumigator, and looks not unlike a small-sized fumigator placed on the top of a larger-sized one. It is stated to answer perfectly.—The Society's garden supplied a fine specimen of Aerides quinquevulnera, grown on the cool system; two Oncids, an Epidendrum, Spathoglottis Fortuni, a pretty species nearly always in flower, and one which everybody having a greenhouse can grow; three varieties of Achimenes, Bæckea patula, Æchmea fulgens, the two-spined Arduina, an old-fashioned stove plant, but which succeeds perfectly in a greenhouse; Pelargonium tetragonum, the Cape Ornithogalum conicum, and one or two other plants. The same establishment also furnished fruit of Wilmot's Black Hamburgh Grape, a Bromham-hall Melon, which on being cut up proved excellent; and the following vegetables, Haricot d'Alger, a French Bean possessing no tough lining or other stringiness, and on that account much esteemed on the Continent. It is so tender that it can be eaten three-fourths grown. Its colour (yellowish green), however, may perhaps render it unsuitable to English tastes. Other vegetables consisted of two kinds of Cabbage—

one, the Pomeranian (Chou de poméranie), a firm, long, conical kind, distributed for these two or three years past by the Society to Fellows; the other, a less-known sort, like the Pomeranian in shape, but shorter, and possessing a glaucous hue, like that of Broccoli. Both are handsomely-formed Cabbages, stated to possess excellent qualities, and deserve a trial n every garden.

Entomological, *Aug.* 5.—The President in the chair. The minutes of the last meeting having been read, and some routine business transacted, the President read a letter addressed to him by W. Spence, Esq., F.R.S., on the great loss which science in general, and the Entomological Society in particular, had sustained by the death of the honorary President, the late Rev. W. Kirby, in which the writer touched upon the virtues and scientific acquirements of the deceased, in a spirit which an intimate acquaintance for half a century, and the closest scientific connection, could alone have inspired. On the motion of Mr. Westwood, seconded by Mr. J. F. Stephens, Mr. Spence was requested to allow his letter to be printed in the Transactions of the Society, with a request that he would extend the same so as to include a complete biographical and bibliographical notice of the late honorary President, and would also allow the portrait in his possession to be engraved for the Society's Transactions. As a further mark of respect, no scientific business was transacted, and the Society immediately adjourned. In addition to the various works noticed in our article announcing the decease of Mr. Kirby (June 15, p. 435), we may add (in order to complete the bibliographical list of his labours), his papers on the Hessian fly, and on some remarkable species of Centrotus, in Loudon's "Magazine of Natural History," numerous papers, chiefly on exotic Coleoptera, in the "Zoological Journal," his address to the Zoological Society soon after its establishment, two papers on the tarsi of Coleopterous insects, in the "Philosophical Magazine," and a notice of insects devouring Asbestos, in the same periodical. Mr. Kirby's entomological collections, containing many very rare insects, and the types of all his published species (except those of the Fauna Boreali-Americana, which are in the British Museum collection), were presented by him many years ago to the Entomological Society, with a proviso of their becoming the property of the Linnean Society, in case the former should cease to exist. *J. O. W.*

Botanical, of Edinburgh, *July* 11.—The President in the Chair. Dr. Cleghorn directed attention to the culture of Cotton in Mysore. He read extracts from a letter of Capt. Onslow in reference to the culture of American Cotton at Cuddoor. In spite of an unfavourable season the experiment had proved satisfactory. The seeds were supplied from Dr. Wight's government plantation, at Coimbatore. "The natives pay in kind, and the produce is bought, if they like to sell at the market rates." Dr. C. had given some attention to the momentous question of Indian Cotton culture when traversing the Peninsula in the execution of duty, and felt no difficulty in expressing his opinion that in the extensive Cotton tracts above the Ghats, large quantities of Cotton might be supplied of an improved quality. In the present state of ignorance and poverty amongst the Ryots, it is manifestly unreasonable to expect rapid progress in the agriculture of Hindostan. The aiming at new improvements are so many deviations from the practice of their ancestors, whose footsteps they follow with the utmost devotion and reverence—hence progress must be slow, but it is not imperceptible. The face of the country is much improved in the districts longest under our rule, and where good roads exist, the next essential for developing the Cotton trade is the presence of enterprising inland traders. Dr. C. mentioned that he had examined and compared all the species of Gossypium in the Herbarium of the Botanical Society (comprising the collections of Hamilton Buchanan and Lady Dalhousie, with contributions from Wight, Campbell, &c.), and also those in the Herbarium of Professor Balfour, with a view to expiscate the specific characters by which to discriminate them from one another; he considered the entire series remarkable, as showing the striking differences which soil, climate, and culture produce in species, and which may appear in nature, giving rise to a multiplication of species. The whole group of so-called species seems referable to G. herbaceum, L., G. arboreum, L., G. barbadense, L., and G. acuminatum, Rox. Dr. C. looked anxiously for the work of Dr. Royle, our chief authority, which is expected to contain the fullest information on the entire subject of Indian Cotton and its culture. Dr. C. stated that the approaching Exhibition in 1851 was exciting much interest in India—committees having been formed in the different districts for collecting and forwarding native produce. A notice was read from Mr. Syme on the occurrence of Eleocharis uniglumis, near Blackness Castle, Linlithgowshire. A paper was read on the effects of insects on plants, by Mr. Hardy, Penmanshiel. In this paper Mr. Hardy alluded particularly to the effects produced by Vibrio graminis, a new species, V. Tritici, Cecidomyia salicina, and Rhyncholophus haustor. Dr. Balfour exhibited specimens of Vibrio in Poa pratensis under the microscope. Dr. Balfour gave an account of a botanical trip to Aberdeen. Dr. Cleghorn exhibited a jacket of the Grass-cloth of commerce, manufactured from the fibres of the Bœhmeria nivea of botanists, the Urtica tenacissima of Roxburgh (Fl. Indica, vol. iii., p. 590). The plant is cultivated in Sumatra, where Marsden says, "The shoots are cut down, dried, and beaten, after which the rind is stripped off;" the fibres so obtained are of very great strength and fineness. In Penang it is likewise cultivated; the Malay name in that island is Rami. Specimens sent to the Agricultural and Horticultural Society from Dr. M'Gowan, of Ningpo, were found by Dr. Falconer to correspond exactly with those grown in the Botanic Garden of Calcutta, where it had been introduced from Sumatra in the days of Roxburgh, with a view to obtaining its valuable fibres. Dr. C. stated that the weight of the jacket was five ounces, and that it cost three rupees. The fabric is coming into increasing consumption in S. India, being imported from Singapore and China in narrow webs. It is much esteemed for light clothing during the hottest weather. Dr. Balfour exhibited a series of fibres of the same nature, fine and coarse, from different species of Hemp Nettle. Dr. Balfour read a letter from Dr. Campbell of Demerara, accompanying some seeds of Victoria regia. Dr. C. says, "I enclose in this a dozen seeds of Victoria regia, brought from the Essequibo a few days ago by an itinerant collector, who seems to know their value, as he charges a dollar (*4s. 2d.*) a dozen for them. I am afraid they will not germinate after their voyage across the Atlantic; but this you must bear in mind, if you intend to try the experiment, that the plant will not live in an atmosphere within the influence of the sea breeze, nor grow in soil or water where there is the least saline principle existing. Such at least is the result of experiments tried here. I visited the locality of the plant in the Essequibo, above 100 miles from the sea, in 1846, and it appeared to me a small lagoon, rather than a lake, over which the river flows in the rainy season. It is surrounded on all sides with a dense 'bush' (natural forest), through which we had great difficulty in dragging a small corial (wood-skin boat) in which we embarked on the lagoon, which is a most gloomy spot, the favourite resort of Caymans, where the sun can scarcely penetrate even at noon, and with an atmosphere oppressively damp and hot. So far as I could judge by sounding and examining the stems of the plant, it appears to grow at a depth of 12 or 14 feet, in an oozy, slimy, muddy sort of compound, with which I presume sand must be mixed, for higher up the river there are immense tracts of loose sand in the bed of the river, which must be swept along with the torrent every rainy season." A number of interesting native and exotic plants was exhibited from the Botanic Garden, including a fine set of British Ferns. Mr. G. Lawson showed a specimen of Lathyrus Lissolia, from the Den of Mains, near Dundee, where he believed it was first found last year by some local botanists. Mr. L. thought it probable that the plant was only naturalised; but it was interesting to notice its occurrence so far north, as Mr. Watson in the "Cybele Britannica," vol i., p. 323, gave its northern limit in Derbyshire, doubting its existence at "the glass houses at Dent's Hole, Newcastle, where it grew in the time of Lawson." Mr. C. Murchison exhibited under the microscope a peculiar fungus—Achorion Schœnleini of Bennett, occurring in the crusts of Favus in a patient in the Royal Infirmary.

Meeting at Worton Cottage, *July* 31.—Picotees: Seedling 27, a light-edged rose, must be considered too thin; Alfred, heavy-edged purple; this bloom has been handed to the artist for figuring, we need say no more for its first-rate qualities. There can be no doubt that this variety will be found at the head of its class, and will form a fitting comparison to the heavy-edged red of Mr. Norman, named Mrs. Norman, a flower which is also in Mr. Andrews' hands. Mr. Edwards produced a nice collection of Carnations and Picotees, and a promising Dahlia, yellow with white tip.

August 7.—Eschscholtzia: "J. E., Cheltenham." A desirable flower, worthy of cultivation, being a creamy white; it will form a pleasing contrast when bedded with the old yellow variety. Fuchsias: "W. H. Story." Your Prince Arthur is an extraordinary flower, and if it is a free bloomer will be found in all collections, whether on the stage or at exhibitions. The tube and sepals crimson; the latter reflex well, showing to great advantage a most unusually full dark purple corolla, something similar to a large double Violet. The four blooms now sent are very superior to the one received on July 17, which by no means fairly represented this singular production.—10-40. If this flower reflexes well it will display to advantage the beautiful bluish violet corolla, well contrasting with the scarlet tube and sepals. Carnation: "R. J. K." We wish your flower had been at the great trial exhibition at Derby, where all our best judges of Carnations and Picotees are gone this day. Perhaps you will send another flower, for to us it appears very good.

Reviews.

An Introduction to Conchology; or Elements of the Natural History of Molluscous Animals. By G. Johnston, M.D. 8vo, pp. 614, with numerous woodcuts. Van Voorst.

The utility of this volume is indisputable. It fills a void that all English students of natural history must have felt to be extremely inconvenient. Dr. Johnston's practical acquaintance with mollusks, and the diligence with which his researches are known to have been conducted, are a guarantee that whatever he writes will have sterling value. His book, then, is a good one, and deserving a place among the many useful publications which we owe to the enterprise of Mr. Van Voorst.

But it has a serious fault. We are told that it was suggested by a perusal of Kirby and Spence's "Introduction to Entomology," but the author has been unfortunate in his imitation of that admirable book. The charm of "Kirby and Spence" consists not alone in its varied learning, its skilful selection of facts, and the happy manner in which they are brought before the reader, but in the pure and simple English in which it is written. It was as welcome to the most unlearned student as to the professed entomologist, and as intelligible. Not a term of science was *needlessly* paraded; but the pure technicalities, and many there must of necessity be in all sciences, were assigned a separate place, where they might be studied without interference with the popular narrative. Latin terms, like arenacolous, saxicavous, pedunculated, hydrophanous, pulmoniferous, branchiferous, and the like, were put into English, and so made intelligible to the commonest apprehension. We are the more surprised to find these pedantries in Dr. Johnston's pages, because he in many instances shows a great anxiety to avoid them. It is, therefore, to be hoped that in the next edition of his work he will strike them out with a relentless hand.

As a fair example of the style of the volume we select the two following extracts:

Medical Uses of Slugs, &c.—"Discarded from the service of the physician, a few Mollusca have found a resting-place in the 'Materia Medica' of the common people, who inherit to the full their wise ancestors' faith in their virtues, which are enhanced by some superstitious traditions and observances. Slugs and snails were anciently, and are to this day, a popular remedy in consumptive complaints. They are sometimes made into a mucilaginous broth, sometimes swallowed in a raw state, and sometimes the shell is pricked through with a large pin to enable the patient to suck the oozing liquor. You may see considerable quantities of of Helix pomatia and aspersa sold in Covent-garden market for this purpose; and still greater quantities are sold in all the large continental cities. In the Isle of Bourbon, the Navicella elliptica is commonly used to make a soup for the sick; and in the same and adjacent islands the animal of Melania amurula, which is very bitter, passes for an excellent remedy in the dropsy. The 'piedra de las ojos,' which are merely worn fragments of shells, are considered in some parts of South America as the most extraordinary production of their coasts, being, in the philosophy of the natives, both a stone and an animal. These fragments are from one to four lines in diameter, with a plain and a convex surface, and when excited by Lemon juice move in proportion as the carbonic acid is disengaged. Placed in the eye, the pretended animal turns on itself, and expels every other foreign substance that may have been accidentally introduced. At the salt works of Araya, and at the village of Maniquares, they were offered to Humboldt and his fellow traveller by hundreds, and the natives were not only earnest to show them the experiment of the Lemon juice, but wished to put sand into their eyes that they might themselves try the efficacy of the remedy. The same custom and superstition is said to prevail in Guernsey; and in the olden time did prevail in the Highlands of Scotland. The Rev. John Frazer, writing of the year 1702, says: 'Snail-stones are much commended for the eyes; and I'm confident their cooling vertue is prevalent against pains bred by a hott cause: their origine is thus, some excrementitious parts avoided by these creatures, condensed by the circumjacent air, and turned to a round figure by the frequent turning; but this is observable, that some of them, speciallye snaile-stones, has the exact figure of the snail.' But what are all these to the use which the pretty maidens of merry England and of Ireland apply the snail in a May morning, when, in the meanders of the slime-tracked creature they decypher—may neither eye nor fate deceive them!—the initial of the one-loved name!

'Last May-day fair I searched to find a snail,
That might my secret lover's name reveal.
Upon a Gooseberry bush a snail I found,
For always snails near sweetest fruit abound.
I seized the vermin, home I quickly sped,
And on the hearth the milk-white embers spread.
Slow crawl'd the snail; and, if I right can spell,
In the soft ashes mark'd a curious L.
Oh! may this wondrous omen lucky prove!
For L is found in Lubberkin and Love.' Gay.

"And, in my younger days, I remember the country school-boy, while strolling, with satchel on his back, from his hamlet to the neighbouring village, would stay to solicit, by doggerel rhymes, the black slug (Arion ater), to protrude its horns; and, having seized them according to the prescribed rules, would go on his way with a gayer heart and elevated hopes."

Gigantic Size of some Mollusks.—"That the cephalopods have size and strength enough for the truculent deeds ascribed to them may be admitted, but the will and the necessary agility is wanting. Mr. Pennant, in reference to the Octupus vulgaris, says, 'A friend of mine, long resident among the Indian isles, and a diligent observer of nature, informed me that the natives affirm that some have been seen two fathoms broad over their centre, and each arm nine fathoms long.' 'The natives of the Polynesian Islands, who dive for shell fish,' I can tell you, on the authority of Mr. Owen, 'have a well-founded dread and abhorrence' of the Onychoteuthis; and, considering its size and formidable armature, one cannot feel surprised that their fears should have exaggerated its destructive attributes. The celebrated diver, Pescecola, whom the Emperor Frederic II. employed to descend into the Straits of Messina, saw there, with horror, enormous cuttle-fish

attached to the rocks, the arms of which, being several yards long, were more than sufficient to strangle a man. Mrs. Graham speaks of having seen a species the arms of which were 18 feet in length; and Sander-Rang met at sea with a kind of Octopus, with short arms, as big as a wine cask; hence this excellent naturalist is induced almost to believe that the stories of the kraken, and other gigantic cephalopods, are only a little exaggerated and emblazoned."

As usual in the books published by Mr. Van Voorst, this volume abounds in beautiful woodcuts.

Garden Memoranda.

Messrs. Knight and Perry's Nursery, King's Road, Chelsea.—Entering by a long greenhouse, now gay with Balsams and the usual summer occupants of such structures, the visitor suddenly finds himself in a lofty conservatory, furnished in the centre with a fountain, and containing some fine old specimen plants in tubs, as well as some of the rarer New Holland introductions. Greenhouse and bedding plants, including all the new French Verbenas, are arranged in groups in front of this conservatory in an open area surrounded by houses, and placed so as to form clumps of various figures intersected by walks. The surface on which they stand is made of coal ashes, and in order to break the uniformity which would otherwise prevail, standard sweet Bays, with round compact handsome heads and clean straight stems, are introduced amongst them. These are in tubs, and if they were placed by the sides of terrace walks, or in other suitable situations, might easily be mistaken for Orange trees. Dwarf Rhododendrons, and other evergreen shrubs, form a boundary to this miniature garden, which has altogether a very ornamental appearance. In a greenhouse containing the better kinds of American and Italian Camellias, selected when in flower, we noticed a Malva with a bluish lilac flower, nearly as handsome as that of an Ipomœa. It was raised from imported seed. In another greenhouse contiguous to this one was a white "Camellia Balsam," with large regularly formed flowers quite 2 inches across. These Camellia Balsams are larger than the common Balsam; they are of various colours, and are stated to be of continental origin. Messrs. Knight and Perry had them from M. Vilmorin, of Paris. A plant of the new Passion-flower (P. Belottii) occupied a rafter of this house, which also contained a fine specimen of the extremely handsome New Zealand tree Fern (Dicksonia squarrosa), and a supposed new Barbacenia, with brilliant deep crimson flowers, larger and more beautiful than those of B. sanguinea. Clerodendron splendens was in flower on the rafters of the Orchid house, and on the roof of another stove the universal favourite Stephanotis floribunda has this season produced bushels of its snowy, sweet-scented blossoms. Poinciana Gillesii has bloomed here against a south-west wall. Its clusters of yellow flowers, with long red stamens, are very handsome. About the centre of the nursery is a nice little stove aquarium, in which was the Victoria Regia, growing admirably and nearly filling the tank. Associated with it were the white, red, and blue Water-Lilies, Nelumbiums, and other aquatics all in robust health, more especially the Nelumbiums, some of whose leaves measure 30 inches across. Nymphæa rubra and dentata are flowering beautifully. Conifers, of which Messrs. Knight and Perry have an extensive collection, are arranged on either side of the main walk, in company with different kinds of Oaks and other ornamental and useful trees. The borders are filled with herbaceous plants, which we are glad to find coming more into fashion than they have been. Amongst them we remarked some of the newer kinds of Potentillas and Larkspurs. Dielytra spectabilis has proved perfectly hardy here. The walls are covered with nicely trained young Peach, Apricot, and other fruit trees, all numbered on leaden labels to correspond with the numbers of the Horticultural Society's Catalogue, while the synonyms are represented by the letters of the alphabet. Under this system a confused nomenclature can hardly take place, and the plan is worthy of more general adoption.

Miscellaneous.

Death of Delile.—We observe in the French journals the announcement of the decease of M. Raffeneau Delile, a celebrated botanist, who accompanied the scientific expedition of Bonaparté into Egypt, and afterwards published an account of the plants observed on that occasion. Neither date nor place are mentioned in connection with this event.

American Mode of Preventing Potato Rot.—Heat in a moist atmosphere increased the destruction, and samples which had been cooled, and thereby partly protected, readily passed through all the changes when again exposed to warm and humid air. After using several substances by direct contact with diseased parts of Potatoes, I soon found that the mixture of sulphurous acid, nitrogen and common air, such as exists when sulphur is burnt in closed vessels, would prevent the further progress of the disease, in tubers already affected, and when exposed in contact with tubers, passing through all stages of the disease, no further change in the prepared ones was induced. The trials were varied, and the uniformity of the results has led me to conclude, that the fumes of burning sulphur, flowing in contact with Potatoes partly diseased, will arrest the further progress of the disease and prevent decay. It is proper that this conclusion should be received as an expression of fact, under the circumstances of experiments on a small scale, and with no more than two varieties of Potatoes; but I confidently expect that the importance of the application will be seen in the largest exhibition of its effects. The practical use of the sulphurous acid gas is very simple, and not expensive. Crude sulphur inflamed in a shallow cast-iron vessel, or an earthen pot, furnishes the fumes which may be led by wooden pipes to the lower part of bins filled with the roots, until the unoccupied space is filled with them. As the fumes cool they become heavier than air, and will then enter every interstice. By placing the pot of burning sulphur in an empty barrel, and inverting over it a barrel filled with Potatoes, having a light rack in place of a head, the fumes will slowly rise within and impregnate the mass; the barrel and contents being then removed, and the head replaced, the exposure may be considered as ample. Where the quantity is large, it would be more economical to leave a space vacant below the loose floor on which they repose, and introduce these fumes until every part of the heap of Potatoes has received a share. It should be remembered that this application will injure, if not destroy the vegetating power of the tubers, and that although this result may be highly desirable for all that are preserved for food, those intended for seed should not be so treated. *Dr. Hayes, in Hovey's Magazine of Horticulture.*

Hardy Herbaceous Plants.—The system of filling a whole bed with plants of one sort, which is now so much practised, has had the effect of withdrawing attention, in a great measure, from this very interesting class of flowers; and yet upon these the beauty of our flower-gardens mainly depended only a few years ago. Some of the kinds which bloom first in spring have already been noticed, and we shall now mention a few other desirable species, with the view of recalling them to recollection. It may be premised that the plants in the following list are unsuitable for planting in masses; their proper place is in those beds of mixed flowers which are still occasionally seen bordering the principal walks, or placed here and there in conspicuous situations, in some pleasure-grounds. One advantage attached to this class of plants is, the small amount of skill or of labour required in their cultivation. Once planted in suitable soil, that is, common garden-ground, moderately enriched with manure, many of them will grow and bloom for years, with little care beyond the thinning and tying of the stems, and an occasional reduction of size when the root-stock has become over-grown. But there are some species which demand a little more attention in return for the gratification they give us, and one of these is Lychnis fulgens, the roots of which frequently perish when exposed to wet and cold during winter; it is therefore necessary to raise young plants from seed every spring, when this species is treated as an ordinary herbaceous plant; but its splendid scarlet colour entitles it to be cultivated in pots, in the same way as the better-known L. coronata. In height it seldom exceeds 1½ or 2 feet, and as it does produce numerous flower-stems, a better effect would be obtained by setting three or four plants in a patch. The doubled-flowered variety of the common scarlet Lychnis (L. chalcedonica) is now seldom seen, although very handsome; so likewise is the double clammy Lychnis (L. viscaria), and the double Cuckoo-flower (L. Flosculi). The genus Delphinium (Larkspur) contains many showy species, among which azureum (light blue), mesoleucum (dark blue, with white centre), and elatum (dark blue), are suitable for the middle of large clumps or the back part of borders, as they all grow 5 to 6 feet high. Of the shorter species, grandiflorum is one of the handsomest, and when propagated from seed several varieties may be obtained, varying in colour between dark blue and white; and occasionally a plant having double blossoms will appear among the seedlings. The beautiful double kind commonly known as grandiflorum appears to belong to a different species. Another taller-growing double sort is called Barlowii, and this also is very handsome. All these are usually in bloom about Midsummer. Several of the herbaceous Ranunculuses have varieties with double flowers, which are very desirable things. One with bright yellow button-like blossoms is probably a variety of Ranunculus acris; this grows about 2 feet high, and is in the height of its beauty in June. Another having very pretty white flowers is rather dwarfer in habit; this by some botanists is referred to R. aconitifolius. Allied to these is Caltha palustris, a marsh-plant with large yellow flowers, of which a double variety, very suitable for moist places, is sometimes seen in gardens. The common Columbine is well known, and some of its varieties are equal in beauty to many flowers of far greater pretensions; but all are eclipsed by the handsome blue and white Aquilegia glandulosa, a species which ought to be in every flower-garden. As a spurious sort is sometimes substituted, it may be as well to intimate that the true kind has been advertised in the *Gardeners' Chronicle*. In the genus Campanula there are so many fine things that it is difficult to make a selection. Among the most desirable, however, will be found Persicifolia, of which there are double and single varieties, both with white and with blue flowers; the double white Throatwort (C. trachilium), and the double white glomerata, all of which grow from 2 to 3 feet high. Taller kinds are grandis (blue), lactiflora (milky white), and pyramidalis (both white and blue varieties); and of very dwarf sorts there are pulla (dark blue), pumila (both blue and white), garganica (blue), and fragilis (blue). A biennial species called the Canterbury Bell (C. medium) is also very ornamental. Seeds of this sown about Midsummer will furnish flowering plants for the following season, and amongst them there will probably be different shades of blue as well as white flowers. C. nobilis will be grown as a novelty rather than for effect, its large pendulous purplish flowers being too dull to be showy. Wahlenbergia (formerly Campanula) grandiflora is a beautiful thing, but very scarce; and Symphiandra pendula, another campanulaceous plant, with white blossoms and a dwarf, drooping habit, deserves cultivation. Pentstemons are all pretty, but unfortunately the best of them are the most tender. Scouleri, venustus, glandulosus, ovatus, and speciosus, have handsome blue flowers, especially the latter, which however, is so delicate, that, to have it in perfection, seedling plants should be grown in pots through the winter, and turned out in spring; treated thus, it makes a splendid bed. Campanulatus and atropurpureus differ chiefly in the colour of their dull purple flowers, the latter being the darkest. Digitalis is more robust, growing upwards of 3 feet high in good soil, and has white flowers. Hesperis matronalis (the Rocket) has two double varieties, one with white, and the other with purple flowers, which ought to be cultivated extensively, especially the white one. Being short-lived plants, a young stock must be kept up by putting in cuttings about Midsummer, after the bloom is over. Hedysarum coronarium (the French Honeysuckle) is one of the most showy of Papilionaceous plants, its deep-red flowers being produced in profusion in June and July. It is a biennial; therefore seed must be sown every year. Catananche cærulea and C. bicolor, the first blue, and the second blue and white, are showy things, their scaly flowers bearing some resemblance to those of the Everlastings. These should be raised from seeds every spring, and treated as biennials. The common Everlasting Pea (Lathyrus latifolius), as well as its white variety, are very ornamental towards the end of summer, when carelessly trained upon a few rough sticks; so likewise is L. grandiflorus. Ononis rotundifolia is an exceedingly pretty thing, with its pale Rose-coloured flowers and low bushy habit; and yet it is seldom seen, probably because it is short-lived, and therefore requires to be frequently renewed from seed. Liatris spicata, scariosa, and elegans produce their spikes of bluish flowers towards the end of summer and beginning of autumn, and are singular as well as pretty. Dictamnus fraxinella is a good old plant now neglected, perhaps because its flowers are not gaudy; and yet there is sufficient character about the plant to make it very interesting. This species is red; and there is another with white flowers, which apppears to differ from it in little but colour. Of the perennial Lupins, polyphyllus is undoubtedly the handsomest, including, however, its white variety. Grandifolius has flowers of a singular dark dull blue, and ornatus is pale blue. By preventing the growth of seed-pods, the flowering season of these plants may be much prolonged. The Aster, in some form or other, is seen in most gardens, especially the tall late-flowering kinds commonly called Michaelmas Daisies; there are, however, several species of lower growth, which ought never to be excluded from herbaceous beds; and of these amellus, spectabilis, sibiricus, and alpinus, have large showy blue flowers; while the smaller blossoms of hyssopifolius and elegans are produced in such profusion that they equal the best in effect. Numberless others, equally fine, might be added to the above list, if space permitted; these, however, will serve to form the nucleus of a good selection. *J. B. Whiting, in Beck's Florist and Garden Miscellany.*

Monstrous Flowers of Pelargoniums.—The following extract from a paper read by Mr. Sowerby at the Conversazione Meeting of the Royal Botanic Society, in the Regent's Park, describes an interesting case of monstrosity. After pointing out the distinguishing characters of the genera Geranium and Pelargonium, Mr. Sowerby proceeded to say, "The gardener, as in this case, when he finds nothing but external beauty to recommend a plant, endeavours, by selecting the most perfect, and then cultivating it highly, to increase in the succeeding both the beauty of colour and of form; and as the beauty of form depends on the same elements as that of colour, that is, as before explained, upon the indication of perfect adaptation to the end, or the resemblance of that indication, so a full round form is especially aimed at by the cultivator of flowers, and the Pelargonium fancier endeavours to obtain five broad and equal petals, to form a round flower, with the upper two deeply and brilliantly coloured, to produce a contrast to the three lower and light-coloured ones; but with all his care the flowers do not come constant, and now and then one will play the truant, and sport as he calls it, and this commonly happens among the most petted or highest cultivated varieties. When the dark colour disappears from the upper petals altogether, and the petals become equal in size and form, it will be observed that the characteristic tubular nectary also disappears. The want of the nectary or honey tube is also accompanied by a regular arrangement of five anther-bearing and five abortive filaments. The white varieties are less liable to this change than those with rose or salmon-coloured petals, and it is also rare among the new fancy varieties; frequently it occurs in the central flower of the truss. In some flowers the nectary is also shortened, and in others a small spot will remain on one petal when the nectary is absent. In the fancy variety called Yeatmannianum grandiflorum, which has spots on all the petals, the spots become equal, the two large spots being reduced. An additional petal also accompanies the change in a few cases. One plant of the

Beauty of Clapham, a rose-coloured variety, has almost every flower changed more or less. Thus it appears that cultivation makes one species of plant appear to run into another, and may destroy a remarkable generic character, consisting of the presence of an important organ in the flower, &c. Thus the gardener seems by over-cultivation to reduce his flower to a lower standard, but I do not think this is exactly the case; for though he may apparently reduce a Cape Pelargonium to a European Geranium in the eye of a botanist, or partly so, still he would have a more truly beautiful flower if he could obtain a full truss of beautiful large rose-coloured or pink flowers; we would recommend a trial of the seed from these sporting flowers." *Magazine of Natural History.*

Vegetation of Bhotan.—On the rocky dry eminences Pinus longifolia grew, and on the flats the beautiful Cycas pectinata, with a stem about 10 feet high, and a tuft of foliage like that of C. revoluta. Many Scitamineæ, but especially Curcuma, were springing up, and the character of the vegetation was altogether that of the Terai. The contrast of the tropical Cycas and Scotch-looking Pine was most wonderful. Much of the forest had been burnt, and we traversed great blackened patches, where the heat was terrific, and increased by the prostrate and still-burning trunks of great trees, which smoulder for months, and leave a heap of white ashes. The larger timber, being hollow in the centre, a current of air is produced, that eats away all the circumference, the sides fall in over the burning centre, and all is consumed. You are often startled, when walking in the forest, by the hot blast proceeding from such trunks, which are approached without suspicion of their being other than cold dead trunks. *Dr. Hooker, in Hooker's Journal of Botany.*

Artificial Production of Diamonds.—The Paris correspondent of the *Atlas* makes the following announcement:—"The scientific world has been in a state of commotion for some time, in consequence of the publication of the discovery of the long-sought-for secret of the fusion and crystallisation of carbon. The Sorbonne has been crowded for the last few days to behold the result of this discovery in the shape of a tolerably-sized diamond of great lustre, which M. Despretz, the happy discoverer, submits to the examination of every chemist or *savant* who chooses to visit him. He declares that so long ago as last autumn he had succeeded in producing the diamond, but in such minute particles as to be visible only through the microscope, and fearful of raising irony and suspicion, he had kept the secret, until, by dint of repeated experiments and great labour, he had completed the one he now offers to public view. Four solar lenses of immense power, aided by the tremendous galvanic pile of the Sorbonne, have been the means of producing the result now before us. M. Despretz holds himself ready to display the experiment whenever it may be required. The diamond produced is of the quality known in the East as the black diamond, one single specimen of which was sold by Prince Rostoff to the late Duke of York for the enormous sum of 12,000*l.*!" *Chemical Gazette.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

As in spring a progressive increase of heat and moisture, to keep pace with the advancing season, was the course pursued, so now an opposite or retrogressive one must be adopted. The healthy state of plants during their winter or season of rest, and the amount of accumulated energy for a new year's growth, depends very much on their management during the autumn. They must be gradually hardened by exposing them to an increased circulation of air and lower temperature, admitting all the light possible. We have frequently urged the necessity of thoroughly watering plants when they need it, in preference to giving a little and often, according to the too common practice. Let it be the rule, then, only to give water when it is required, and then to give plenty. These remarks apply more particularly to hard-wooded plants, which, to ripen their growth, require a longer season than those of a more herbaceous character, which will continue to grow and flower some time longer. Remember the value of liquid manure for plants which are flowering freely, and others which it is desirable to invigorate to the utmost. We have scarcely a more beautiful or more elegant plant for conservatory decoration in April and May than the Schizanthus; for this purpose the seeds should now be sown, and at the same time the different species of Lisianthus for next autumn's display. Neapolitan and tree Violets should now be lifted, and potted in 4 or 5-inch pots for winter flowering. As this is a flower which everybody loves, nothing can be more acceptable at that comparatively flowerless season.

FORCING DEPARTMENT.

PEACH-HOUSES.—As soon as the crop is entirely removed, any of the trees which exhibit too gross a tendency in their tops should be partially root pruned by forking down at a safe distance of from 2 to 3 feet, according to the age of the tree, and shortening some of the strongest roots. Any tree which is very gross should be carefully undermined, to ascertain if any roots have descended into the subsoil. If such is found to be the case, they should, of course, be cut away; and to prevent a recurrence of the same, the tree should be lifted out entirely, and the bottom of the border made impervious by means of concrete. The trees should be frequently examined, to prevent the establishment of scale, red spider, or other insects. It is sometimes difficult to eradicate these pests entirely, but perseverance will do much. MELONS.—Keep up a good bottom heat, or shanking and canker will be a natural consequence. We are very careful that the proper temperature is maintained, and by this means disease is avoided amongst the latest crops. Keep the plants sufficiently thin, to allow the air to circulate freely amongst the leaves, and to act upon the surface of the soil. Thin the weak shoots, and let all the fruits be properly supported upon some hard dry substance.

FLOWER GARDEN AND SHRUBBERIES.

The roots of the Iris, Narcissus, Lilies, and other spring-flowering bulbs, with few exceptions, succeed best if not taken up too often; and, except for the purpose of dividing them to increase the stock, or to plant them in a new situation, they had better remain undisturbed. When any are taken up for the above purposes, they should be replanted again as soon as possible, as they remain a very short time in a dormant state before they begin to form new roots, that they may firmly establish themselves before winter. These are all deep-rooting plants, and require that the beds should be deeply trenched. The manure should be placed in the bottom of the trench, to encourage the downward progress of the roots, and thereby make them more independent during the scorching months of June and July. The Tiger-Lily is very ornamental at this season; it is very showy when planted in straight lines, or amongst the promiscuous masses of large clumps. In the axils of the leaves, if the plants are now examined, small bulbs will be found, which should be carefully collected and planted, about an inch asunder, in boxes of light soil. Many annuals and perennials have now ripened their seed, which should be gathered immediately in fine dry weather, and spread out in a cool airy shed.

FLORISTS' FLOWERS.

Take the first opportunity of making a bed to put out Pansies for the winter and spring stock; let it be tolerably rich, and after a thorough examination for wireworms, plant it. Should the weather prove hot and dry, hoop it over, and cover with mats or calico, watering them as they require it. After they have taken root, the covering may be removed the first wet day. AURICULAS will now begin to require a little more attention; stout offsets, which have stood two, three, or four round the side of a pot, may be repotted singly in properly prepared compost. Attend to watering in dry weather, and keep down the aphis, as before recommended. CARNATIONS AND PICOTEES.—Layer as fast as possible; it is not advisable to propagate run flowers, though there are often selfs of various colours in beds of seedlings, which it is advisable to save for border flowers. As the petals wither, feel the pods, and if they give evidence of swelling for seed pull out the petals, as they often contract damp, and destroy the capsule. Thin Dahlias that require it, and carefully remove all "cross-eyed" or semi-double flowers.

FRUIT GARDEN.

It will be well to examine the state of the soil about the roots of Peaches, Apricots, and Figs, on the open walls, and especially of those which carry a crop of fruit; in many cases the ground will be found very dry, particularly where overhanging copings are in use; and unless watered the trees will soon show evidence of the neglect, by casting some of their fruit, or by their diminutive size and absence of flavour. Let the earlier varieties of Pears and Apples be carefully gathered as they ripen. Means must now be taken to preserve the wall fruit from the ravages of wasps, flies, &c., either by covering the fruit with some material to exclude these pests, or by entrapping the latter with something more attractive and more come-at-able than the tough-skinned fruit. The latter mode of dealing with the enemy is preferable, as by covering the fruit with any opaque material it is screened from the sun, and thus deteriorated both in appearance and quality.

KITCHEN GARDEN.

If our advice relative to the making of new Strawberry-beds very early in the season has been attended to, a portion of the old ones may be destroyed. Such ground, having been several years almost undisturbed, should be deeply trenched, dunged according to its requirements, and planted or sown with some useful winter or spring crop. Tripoli Onions for future transplanting should now be sown, and Endive for a late crop. Continue to make successional sowings of Cos Lettuce, and make the first sowing of Hammersmith Cabbage Lettuce to transplant into warm borders for late autumn use. The last sowing of early Stone and white Globe Turnips should be made this week. A considerable share of attention should now be directed towards securing an adequate supply of salads and other small matters for winter use. Chicory is one invaluable plant of which there should be no scarcity; and as it will do in spare nooks or corners, there need not be any difficulty made about want of room.

State of the Weather near London, for the week ending Aug. 8, 1850, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 11th, 1835, and 15th, 1842—therm. 92 deg.; and the lowest on the 13th, 1839—therm. 32 deg.

Notices to Correspondents.

ANTS: *D S.* See p. 293 of the current year's volume.‡

BERBERIS AQUIFOLIUM: *Sub.* The berries make a good preserve in the shape of a jam.‡

CESSPOOL MUD: *Sub.* Mix it with leaves, lawn sweepings, weeds, and such rubbish, and leave it in a heap till autumn.

ELM: *W F P.* We see no merit in it; it is an ugly variety of an ugly form of Elm. Do not propagate it. The idle fancy for such trifling things is gone off, now that selections have taken the place of collections.

ILLEGIBLE WRITING: *A Constant Reader* would be greatly obliged to any one who can give her a method of restoring writing on parchment labels. Did she ever try the experiment of steeping the labels in a weak solution of sulphate of iron?

INSECTS: *Sub, Bucks.* If you will favour us with some of the insects to which your letter refers, we may then be able to assist you.‡—*R M.* The insects upon the Oats are a species of plant louse (Aphis Avenæ) which will doubtless be dispersed by the change of the weather. Are they found at the roots as well as on the stems or grains, or are there not two different kinds? *W.*—*C R.* See the last answer, and please to inform us what parts of the plants are attacked. *W.*—*J W.* The larvæ sent have the cuticle on one side gnawed off by the larvæ or slimy grubs of the saw-fly (Selandria Æthiops); lime, and lime-water are the best remedies for their destruction. *W.*—*A M S.* The larger fly is a species of Stomoxys, which had seized a small Tachena to suck it for food. *W.*

MELONS: *W H.* Your description applies to the Cabul Melons. Do not you know that Peshawur and Jellalabad are towns on the line of march to the city of Cabul?

NAMES OF PLANTS: *J S W, Great Marlow.* A charming thing, but no novelty. The name of Amaryllis natalensis is merely a nursery name. The plant is the old and well known Crinum revolutum.—*E M.* 1, Sempervivum villosum; 2, Sedum dasyphyllum.—*Ignoramus.* They are the eggs of an insect.—*H G L.* Stanhopea graveolens, Oncidium sanguineum, and some uninteresting Oxalis, which cannot be ascertained from such a fragment.—*H R J. A*, Veratrum nigrum; *B*, Asclepias syriaca; *C*, Astrantia major; *D*, Funkia cærulea; *E*, Monarda didyma.—*J P.* 8, Rudbeckia digitata; 7, indeterminable; 5, Eutoca viscida; 10, Nemophila punctata; 9, Campanula Loreyi; 1, Zinnia elegans; 2, Phlox Drummondi; 3, Verbascum, perhaps phœniceum; 4, Godetia purpurea; 6, Linaria triphylla. Wretched specimens in a wretched mess; they should have been laid flat between paper, not twisted up. Would it not have been better to have taken care of the names by which these common things were received?—*F D H.* Calosanthes is a name given by Dr. Blume to the Bignonia indica of Linnæus. The seed you have sent belongs to it.—*E M.* Apparently a fragment of Sedum album.—*F L.* Agrostis alba and Triticum junceum. —*W P.* Sedum glaucum, and Gnaphalium germanicum.—*E S.* Spiræa ariæfolia.—*D W P.* 1, Anemidictyon phyllitidis; 2, Pteris tremula; 3, Adiantum trapeziforme; 4, Goniophlebium meniscifolium; 5, Lastrea chrysoloba; 6, Adiantum cuneatum; 7, Pteris serrulata; 8, Adiantum pubescens; 9, Athyrium sp.? bad specimen sent; 10, Diplazium Shepherdii; 11, Pteris crenata; 12, Cassebeera pedata. *S.*—*C Rae.* Vanda tricolor and Aspasia lunata.

ONION DISEASE: *W W.* We will reply to this inquiry hereafter.

PEACH TREES: *W H.* Nothing but personal examination of the ground can explain the difference in the health of the trees. The curl is caused by cold acting on soft tissue, and is aggravated by the aphis which follows it. Yews and Ivy *cannot* produce it. Syringe, syringe, syringe, and you will get rid of the aphids.

PLANTATIONS: *H R M.* You must not expect flowers under trees, except in a limited degree. Plant Lilies of the Valley, Primroses, Cowslips, and wild Hyacinths, with plants of Periwinkle, Privet, and the larger Tutsan (Hypericum calycinum). As bushes, without flowers, you may have Cherry Laurels, Phillyreas, Hollies, Alaternus, Yews, and Ivy. We cannot undertake to name plants not in flower.

POTATOES: *Titus, H R S.* We believe the best course to pursue, where they are undoubtedly blighted, is to mow the stems down, to put 3 or 4 inches of earth over the ground, and to roll it down with a very heavy roller.

ROOT PRUNING: *J G.* See p. 472, col. c.

ROSES: *Anon.* China Roses that become naked at bottom may be pruned as follows, presuming there are five shoots: Shorten two to within 6 or 8 inches from their base, leaving the others to grow during the season. When the young shoots from those shortened have made some progress, *i. e.*, next or the following season, the remaining base shoots should be cut down; they may be shortened now, but March is the best season for it.‡

STRAWBERRIES: *Anon.* Early kinds: Cuthill's Black Prince, and Keens' Seedling. Late kinds: British Queen, Myatt's Eliza, and Egbert.‡

VINES: *Vitis.* We cannot discover anything amiss with the leaves. The spots you speak of are not visible.

VINERIES: *J C.* It matters little at what angle the roof is constructed, provided it is steep enough to prevent drip. You should consult some professional man, who will supply working plans. You need not use tanners' bark for Pines, provided you have plenty of leaves and nice loose loamy earth. "Verbena" cuttings, treated like Geranium cuttings, never fail, if the wood is ripe enough. Let the pipes go round the house, but mind that the bottom inside is thoroughly drained, so that no water can collect near the surface.

MISC.: *L L.* You may moderately thin the head of your Mulberry tree now. Keens' Seedling Strawberry will answer your purpose better than Alice Maude. Permit all the shoots of Asparagus to run up after you have done cutting; but they should not be allowed to seed.‡—*A Young Gardener.* No leaves were in your letter.

SEEDLING FLOWERS.

CALCEOLARIAS: *T R P.* Prettily marked, but too much indented in the edge, and not sufficiently smooth.*—*M H.* 30 is much the best. 29, a good small flower, but too large in the throat. Your other blooms have also this fault, and they are all more or less deficient in shape.*

FUCHSIAS: *Cavaniensis.* All greatly inferior to the finer kinds now in cultivation.*

WHITE ESCHSCHOLTZIA: *C B.* See our account, in another page, of the meeting at Worton Cottage.*

TO NOBLEMEN and GENTLEMEN who require a plentiful and CONSTANT SUPPLY of PURE WATER to their Country Mansions.

Messrs. EASTON and AMOS beg to offer their improved PATENT HYDRAULIC RAM, which is perfectly self-acting, and without manual labour is capable of lifting water to 30 times the height of the waterfall by which it is worked.

THIS MACHINE CAN BE APPLIED WHEREVER A FALL OF WATER OF A FEW FEET CAN BE OBTAINED; and its cheapness and durability, with the fact that upwards of 500 of them erected in England and other countries by Messrs. EASTON and AMOS have now been at work many years, afford ample proof of its great value and efficiency.

Estimates of the expense of the Machine, Pipes for the conveyance of Water, Tanks, and Reservoirs, may be had on application to Messrs. EASTON and AMOS, CONSULTING ENGINEERS to the ROYAL AGRICULTURAL SOCIETY, at their office in Orange-street, Trafalgar-square, or at the Works in the Grove, Southwark, London.

PERUVIAN GUANO.—As Agents of the Peruvian Government for the importation and sale of this valuable MANURE, we think it right, for the protection of consumers and respectable dealers, to apprise them that the adulteration of the article is still extensively practised, and to recommend them to apply either to ourselves, to our agents, Messrs. GIBBS, BRIGHT, and Co., of Liverpool and Bristol, or to dealers of established character, in whose honesty and fair dealing they can place implicit confidence. ANTONY GIBBS and SONS.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

Corn and Grass Manure, per ton	...	...	£10 0 0
Clover Manure, do.	...	...	11 0 0
Turnip Manure, do.	...	...	7 0 0
Superphosphate of Lime	...	...	7 0 0
Sulphuric Acid and Coprolites	...	...	5 0 0

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 15*s.* per ton; and for 5 tons or more, 9*l.* 10*s.* per ton, in dock. Sulphate of Ammonia, &c.

CORN MANURE FOR WHEAT, BARLEY, OATS, BEANS, &c. &c.

THE LONDON MANURE COMPANY most confidently recommend the above, as they are daily receiving very satisfactory accounts from parties who used it with great success last season. It will be found fully equal to and much cheaper than Peruvian Guano, and is not so liable to produce so large a growth of straw. Price Seven Guineas per ton, 3 cwt. per acre. They also beg to offer their Concentrated Urate, Superphosphate Lime, Nitrate of Soda, Sulphate and Phosphate of Ammonia, Fishery and other Salt, Gypsum, Sulphuric Acid, and genuine Peruvian Guano. To insure this free from adulteration, all purchasers can receive it direct from the Warehouses of the Importer.

Bridge-street, Blackfriars. EDWARD PURSER, Secretary.
Country Dealers and Agents supplied.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

E. DENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses, when completed charged, from 1*s.* 3*d.* to 1*s.* 6*d.* per superficial foot, according to size and quantity; on one principle the roof is formed without wood or putty, and on another principle with wood rafters, and the glass put in with putty. Patent Sashes, requiring no paint, from 7*d.* to 9*d.* per foot. HEATING BY HOT WATER.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

PURE WATER raised to any height from a small stream, where a fall can be obtained, by FREEMAN ROE and HANSON'S IMPROVED RAM; less waste, by two-thirds, than those ordinarily in use. Portable Steam Engines for Agricultural purposes, Threshing Machines, Deep-well Pumps, Water-wheels, Baths, Hot-water Apparatus, and Fountains. Towns supplied with Gas or Water. Drawings and Estimates made.—FREEMAN ROE and HANSON, Hydraulic and Gas Engineers; Office, 70, Strand, London.

FOR WATERING GARDENS, BREWERS' USE, &c.
FLEXIBLE INDIA-RUBBER HOSE PIPES.

JAMES LYNE HANCOCK, Sole Licensee and Manufacturer of the PATENT VULCANISED INDIA-RUBBER PIPES and TUBING.

These Pipes are well adapted for Watering Gardens, conveying Liquid Manure, racking Beer and Cider, Gas Fittings, Chemical and all purposes where a perfectly sound WATERPROOF and FLEXIBLE PIPE is required.

Hot Liquors or Acids do not injure them. No oil or dressing is required in using them. They do not leak from remaining out of use, are permanently Flexible in all Temperatures, and are therefore particularly suitable for Fire Engines; and, from their not leaking, are found exceedingly useful in conveying hot or cold water to baths in dwelling houses and such like purposes.

A LIGHT VULCANISED INDIA-RUBBER HOSE is now manufactured for conducting Water and Fluids, at the following prices per foot:

Size.	½ in.	⅝ in.	¾ in.	1 in.	1½ in.	2 in.	2½ in.	3 in.
1 ply ...	0*s.* 5*d.*	0*s.* 6*d.*	0*s.* 8*d.*	0*s* 10*d.*	1*s.* 0*d.*	1*s.* 2*d.*	1*s.* 4*d.*	1*s.* 6*d.*
2 ply ...	0 8	0 9	1 0	1 2	1 5	1 8	2 0	2 3
3 ply ...	0 11	1 0	1 3	1 6	1 10	2 2	2 9	3 3

N.B. Vulcanised India-Rubber Garden Hose fitted with roses, jets, and branches, complete, with union joints ready to attach to pumps or water cisterns.

All orders or letters addressed to J. L. HANCOCK, at the Manufactory (and Warehouse), Goswell-mews, Goswell-road, London, will meet with immediate attention.

THE CONICAL BOILERS INVENTED BY JOHN ROGERS, Esq., are supplied and fixed by JOHN SHEWEN, ironmonger, Sevenoaks. Also all kinds of Hot Water Apparatus. For Churches and Public Buildings, Mr. SHEWEN should be consulted, his Warm Air Apparatus being safer, more efficient, and more durable than any other.

LIGHT, CHEAP, AND DURABLE ROOFING.

CROGGON'S PATENT ASPHALTE ROOFING FELT is perfectly impervious to rain, snow, and frost, and has been tested by a long and extensive experience in all climates. Saves half the timber required for slates; can be laid on with great facility by farm servants, or unpractised persons. Price 1*d.* per square foot.

CROGGON'S PATENT NON-CONDUCTING FELT, for Steam Boilers and Pipes, saves 25 per cent. of fuel.

Samples and Testimonials sent by post, on application to CROGGON and Co., 2, Dowgate-hill, London.

MESSRS. NESBIT'S CHEMICAL AND AGRICULTURAL SCHOOL, 38, Kennington-lane, London.—A sound practical knowledge of Analytical and Agricultural Chemistry, Geology, Surveying, Levelling, Railway Engineering, &c., may be obtained in Messrs. NESBIT'S Academy, in addition to a good modern education.

Mr. NESBIT'S works on Arithmetic, Mensuration, Gauging, Land Surveying, English Parsing, &c., are published by LONGMAN and Co., and may be had of all Booksellers.

The Agricultural Gazette.

MEETINGS FOR THE FOLLOWING WEEK.

WEDNESDAY,	Aug. 14	—Agricultural Society of England.
THURSDAY,	— 15	—Agricultural Imp. Society of Ireland.
THURSDAY,	— 22	—Agricultural Imp. Society of Ireland.

"A LETTER to the Lord Bishop of NORWICH on the establishment of ADULT SCHOOLS IN AGRICULTURAL DISTRICTS,"* has lately been published by "A Country Curate" who has already written on the subject in our columns (page 458). He speaks of the improvement in the diocese of Norwich, as regards the education of the common people, during the life of Bishop STANLEY. "School-houses have sprung up in all quarters, and the instruction afforded at them is now, generally speaking, of a superior character:" and he thinks that, "without being too sanguine, he may hope the time is not far distant when, in every parish where it is possible, we shall see not only a National School, but that school conducted by an efficient teacher."

But even supposing excellent schools and efficient teachers everywhere to exist, he doubts, and so do we, whether they alone, as ordinarily conducted, will suffice in agricultural districts to convey the requisite education to the labouring classes. How long does the education of the boy in a country district really last? "Considering the many interruptions he meets with, by being taken from school at certain seasons for petty agricultural employments, the time consumed in regaining what he has forgotten on these occasions—the early period at which he leaves school entirely, that he may add his mite, however small, to the family income—his time of education is indeed sadly limited. He leaves school with little of learning but the letter; his acquirements are little more than mechanical, and, in consequence of his youth, they have as yet had but little influence either upon his understanding or his heart." And the consequence is that, on leaving school, as he grows up to manhood, his leisure is being occupied and his mind being formed on the model presented by his associates—the idle and disreputable, of whom every parish has its share.

Now the author of this letter proposes to his brother clergymen a plan for combating this evil. He suggests the adoption of evening schools for adults during the winter season; and the experience of his first six months leads him confidently to assert their ability to meet the case: so that he speaks of the common opinion as "a popular fallacy"—that the education of the *young* is our only hope; or as the Rev. RICHARD DAWES expresses it—"that no great improvement can be effected in the manners of the people but by the education of the *rising generation*."

Now having had several years' experience of an evening school, conducted just as this gentleman recommends — and knowing something of several others of similar character, conducted, some of them by young farmers, others by dissenting ministers, of whose valuable labours our author exhibits a characteristic tendency to speak disparagingly—and others in connection with the established church, we willingly join him in praise and recommendation of the system, but at the same time without denouncing it as a popular fallacy that the existence of an educated people must depend almost wholly upon attention to the education of *children*.

We have seen reading and writing and arithmetic learned, at these evening schools, by adults to whom they, or at least the last two, have afterwards been useful; but for implanting the tendencies of a well-educated mind—the desire for information, and the taste for reading—which is possible and easy if you commence with the young, we cannot speak of them with the confidence with which "A Country Curate's" experience seems to have inspired him. Certainly, a single winter cannot, except very rarely, be long enough, nor its 100 hours' instruction sufficient, to effect a change in perhaps a 20-years' habit of indifference, or thought, or action. And therefore we hope that no imperfect remedy, such as that recommended in this letter, useful as it may be, will, in the least, tend to displace the attention which ought to be bent upon the education of the young, as presenting the only probability of our ultimate escape from those evils of ignorance, crime, and pauperism, which now press so heavily upon the agricultural and all the other interests of this country.

Nevertheless, we earnestly hope the example which this gentleman has set us will be generally followed; not as substitutes for, but as additions to, the most perfect system of education that can be offered to children. Evening schools for adults, if they can be made interesting as well as useful, will be beneficial, by diminishing the influence of mischievous sources of pleasure, as well as by the direct ability and information they may confer. And our own experience will attest that they can be carried out with little labour, and less expense, wherever two or three can be induced to join and share the former, being able at the same time to offer amongst them schooling of a quality which, by the fees it will command, shall defray the latter. In one locality with which we are acquainted, a perfectly successful attempt was made during the last winter to open a reading-room, furnished with books and newspapers, in connection with the school; and the subscriptions to the reading-room, the school fees, and the receipts from attendants at the five or six lectures on various interesting subjects delivered during the winter, proved very nearly sufficient to defray the expenses of the whole establishment. That good was done in that locality by the mere substitution of *useful* pleasures for those of the beer-house, during a certain number of winter evenings, cannot be denied; and, without doubt, real permanent benefit will ultimately be experienced by any who may persevere in their attendance as scholars. For these reasons we would be glad to know that the "Letter on Adult Schools," by "A Country Curate," was widely read, and its plans very generally adopted. The recommendation of the author will apply to any properly-qualified person, as well as clergymen; and if we could induce any one to attempt the establishment of some such scheme in his locality during the ensuing season, we should be glad to supply him with all the details of the particular case to which we have alluded. We are sure that the pages of the *Agricultural Gazette* cannot be more appropriately occupied than in discussing questions connected with the condition of the labouring classes in rural districts; or in advocating those plans for improving it which commence in the only right way, with influences brought to bear upon the *mind*.

* LONGMAN'S.

THE SOIL AND THE AIR.

A VILLAGE LECTURE.

MANY here may be unable to feel a professional interest in the subject of this lecture. The soil and the air, in connexion with agriculture, have no immediate bearing upon their daily pursuits; and whether the influences which thus affect the practice of the farmers be capable of satisfactory explanation or not, the practice and the profit of their own individual occupations will remain precisely as they hitherto have been—undisturbed by those particular truths which our subject includes. The subject, however, I am persuaded, is not the less appropriate on that account for general consideration. It is one of general interest, not only because the air we all breathe and the soil we all tread cannot but in some measure affect us all alike, but because the usefulness of knowledge on this, as on every other subject, is not measurable by the *£. s. d.* scale, which would confine it to those cases exclusively where a money result depends upon the possession of it. There is a usefulness besides that which immediate profit measures; and though the agriculturist should not, and others could not, earn the more because they know the more of the air and the soil in connection with the art of cultivation, yet such knowledge is beneficial to all as an addition to mental if not to material wealth—as food for the mind, which, like the body, can live only by appropriate nourishment — as matter for pleasurable thought, from which, as from all other topics, we may usefully draw the unfailing inference regarding the wisdom, skill, and power and goodness which creation everywhere exhibits.

But if the soil and the air, in connection with agriculture, may reasonably claim the attention of all, it seems to force itself upon that of the farmer, and it is to that aspect of the subject, almost exclusively, in which it appears to him, that I have now to ask your attention. It certainly must have sometimes occurred to those who cultivate the ground and superintend the growth of crops, to ask where these crops all come from. Do you think that they come out of the land—from the soil on which they grow? Let us just consider this question in detail. Take the case of a forest of trees. Did all that wood come out of the soil? Suppose a man to plant an acorn in a piece of clay land and watch its growth. He sees the shoot and the young tree in-

creasing in size, and if he should live long enough he would ultimately see the old tree with its trunk, its branches, and its twigs, containing perhaps 40 or 50 tons weight of wood—a result of the life which was resident in that little acorn. Where did it get that wood? The roots of the Oak grow downwards in the land to a great depth—do they find its woody matter there? They also spread on the surface to some extent, but do you think that there is enough of the woody charcoally matter there to furnish the material of that great tree? It was a poor clay when the acorn was planted, and no one has been near the place since to supply the growing plant with the matter it wanted: we may suppose the tree to have stood in a forest near which no dung-cart ever went, so that no supply of food for the plant could have reached it beyond what existed when the seed was planted, and then the soil was very poor, and contained none of the material which has since appeared in the stem, and leaves, and branches of that great tree. How did they obtain it? The thing certainly appears difficult of explanation.

Take the case, too, of any of our common crops—of our Grass lands, for instance. Let us imagine the case of a dairy farm of 100 acres: we may suppose it to be able to maintain a herd of 30 cows. What will such a farm produce in a year? Suppose it to be good land, able to keep a stock of good sort: perhaps I shall not be far wrong if I put the produce of a cow at something like 3½ cwt. of cheese, and 30 or 40 lbs. of whey butter every year; and, beside this, there may be some bacon made from the waste of the dairy. Well, then, a farm of 30 dairy cows will yield nearly 5 tons of cheese and 8 cwt. of butter in the year, beside this bacon. That quantity of butter and cheese are exported annually from that extent of Grass land. Now, where did that butter and cheese come from? Has it been made out of the substance of the cows? They are as heavy now as they were. It has not been made at the expense of the cows—any more, indeed, than the Wheat or the Barley which come from the threshing machine is made at the expense of the machine. The cows are merely the machines by which the cheese is made out of the food they eat, and just as the Wheat is in the rick that is being threshed, so the cheese resides in the Grass that is being eaten. Well, then, where does the Grass get it? From the soil, do you think? Just consider; take a hundred years—what has been added to the soil of that farm during that period? Hardly anything; the farmer may perhaps have bought some bran and some meal every season for the pigs; but then he has sold the bacon made by his purchases, so that the farm has lost as much as it has gained in that respect. He has bought no manure. It will not do to say the farm continues to yield the Grass because of the manure that is added—for none has been added—to the farm—none has been brought on to the farm. Manure has no doubt been added to the fields, but none has been imported from without the farm, and yet 5 tons of cheese have been exported every year; and how has that great draught upon the farm been maintained without loss? The manure that is applied to the field helps the Grass greatly; but it cannot supply the cheese I speak of; for you must acknowledge that the manure is just what remains of the Grass after the cows have taken the butter and the cheese out of it, so that every year the land is robbed of so much cheese—that is, if the cheese be in the soil. But can you believe that it is? Can you believe that every year the soil of this farm is the poorer by 5 tons of cheese than it was? Why, how long has it stood this waste? If we suppose that it has been yielding at that rate during 1000 years, there must have been 5000 tons of cheese in the soil of that farm—50 tons of cheese in every acre of it at the beginning—and if anything the farm is more fertile now than it was then—fuller of cheese no doubt than ever; so that, for all we know, there must be thousands upon thousands of tons of cheese in it still. Ah! but that explanation cannot stand; we cannot believe that the wood of our trees or the cheese or the butter of our dairy farms come out of the soil. Where do they come from then? Now, before attempting to answer this question, let us take the case of an arable farm. Suppose I take our own at —— for an instance. It contains about 270 acres of land—off 120 or 130 acres of it every year we cut a crop of Wheat, which may average from 32 to 36 bushels of Wheat per acre; and besides these 4500 or 4600 bushels of Wheat, we sell annually probably 10 or 11 tons weight of beef, mutton, and bacon; that is, the animals we sell off are, on the whole, heavier by that weight than they were when brought on. We buy some 100 or 200 bags of meal and Linseed as food for the live stock every year, so that *that* much is added to the soil every year, and that may account for 500 or 600 of the bushels of Wheat we sell off; but where do we get the other 4000, and where does all that beef and mutton that we sell come from? It will not do to say that it comes from the manure; for set a watch upon the entrance gate of the farm, and count what goes in and what comes out of it in a year: hardly any manure goes in, and you will find there are 4000 bushels of grain go off the farm in a year, and you will find that 10 or 11 tons weight of meat go off the farm more than comes on to it in the year. Where does all that food come from? The question is, whether or not it can be supposed to come from the soil. During the past 10 years we must have sent off the farm 30,000 or 40,000 bushels of Wheat and 100 tons of meat. I take our own case as it is, the only one I am perfectly acquainted with; but any cultivator of the soil will, if he looks back a few years, have to acknowledge the same remarkable truths in the case of his own farm. Do you think that all that bread and beef came out of the land? Why, the land is richer and better after all that has been taken out of it than it was before; and if it be kept in cultivation for years to come, it may yield hundreds of thousands of bushels of Wheat yet; they are not there now, most certainly—where will they come from? Neither the wood of our trees, nor the dairy produce of our Grass lands, nor the grain and meat of our arable lands can be supposed to come from the soil. If all the Wheat, and Oats, and Rye, and Barley, and Beans and Peas, and bacon and butter, and beef and cheese, and mutton, and so on, that England has produced, since it was first cultivated, were piled upon the land now it would be more than a foot deep over the whole island. Deeper than the soil itself is, on the average, over the country. And should things remain as they are for another 1000 years the land will have yielded another such lot, *i. e.* more food in point of bulk and of weight than the soil itself actually *is*. Where has it—where will it all come from? That is the question. Now for the answer.

A plant is made up of roots, and a stem which carries leaves. It does not live in the soil only—the greater part of it lives in the air. Almost the whole of the plant above ground is covered with pores, little holes in its skin through which it absorbs, sucks in food. Only the *extremities* of the roots have these pores by which they can absorb nourishment. No doubt the roots do take in water from the soil, and along with it they will take in whatever the water has dissolved in it. But then if you examine this water you will find very little of the matter of wood, or of cheese, or of corn, or of meat, dissolved in it. The water which comes from our drains, and which is such as the roots of plants suck up, is indeed apparently clear and quite pure, very good water to drink, but none of us would get fat upon it if that were all we had to live upon. Neither, you may depend upon it, will a tree or a plant get stouter and grow if that be all that it has to live upon. The soil contains quite as much vegetable matter at the end of a rotation of crops as it does at the beginning; it contains a great deal *more* vegetable matter after a forest of trees has been grown out of it than it did when the acorns were planted; therefore all this matter could not have been got out of the land—the water could not have dissolved all this matter out of the earth and furnished it to the roots of plants, so that they might suck it up and flourish upon it. No! the great bulk of every plant that grows enters it—not by the roots from the earth, but by the leaves from the air. It is the air and the sunshine and the rain-water, not the mineral matter of the soil, that make our trees to shoot, our Turnips to swell, and our Wheat and grain crop to ripen their seed.

But before entering upon the argument by which I have to prove this, I may as well just refer to the idea which some people may have that a plant changes the matter of the soil on which it feeds into its own substance. It cannot do this; it cannot make one thing into another. It must have the right things given to it, or it cannot grow; too much of one thing will not make up for the absence of another. Unless a mason be provided with the wood and the bricks and the mortar, he cannot build the house; and neither can a plant build its own structure up unless it be provided with the right things in the right quantity. The mason might have abundance of bricks; but if he had that alone he could not proceed; he could not make everything he wanted out of an abundance of only one of them. And just so with plants; you must not think that they can make the wood, or the seed, or the leaves, or the root, out of the earth of the soil. They have no power to make one thing into another; they can only make wood out of the matter of wood; leaves out of the matter of leaves; seed out of the matter of seed. It is quite consistent with what is known to say that when the world was created only 60 or 70 different kinds of particles or atoms, and a certain number of each sort, were called into being; and that though they were put together in so many different forms, and though as time passes some of these substances thus formed are continually being taken to pieces, as it were, and decomposed, and others are being built up of the pieces, yet the world is made of just the same number of each kind of particles or atoms; the same number of pieces of each kind now, as it was 6000 years ago. It is consistent, I say, with what is known, to suppose that not one particle has been created since—not one since been converted into another. Each is as it was when originally called into being, and though not in the same place now, nor united with the same companions now as it was then, yet it is the same particle possessed of the same shape, size, and weight, and endowed with the same properties. Now, these particles are perfectly distinguishable and recognisable, but I cannot go through the process just now by which the individuality and proper distinct character and existence of each is proved, and therefore you must be content to believe me when I say that the soil contains comparatively few of those particles which go to make the bulk of a tree, or the substance of butter, of cheese, of Wheat, or of meat—that it positively contains more of them every year under good farming, notwithstanding that butter and cheese, and Wheat and meat, are every year being sent off it to market, and that as neither a plant, nor anything else can change one thing into another, the matter of wood, or of one different agricultural product not being in the soil in sufficient quantity, it cannot come out of the soil in sufficient quantity to form the building material of the trees and plants that grow upon the land. The great bulk of each came not from the soil but the air.

You will see, by-and-bye, notwithstanding that it is quite consistent with this statement, that the farmer should cultivate and manure the land to make his plants grow; for, though the soil does not provide the plant with much of its substance, yet it provides something which is necessary to it and without which the plant could not live. If the ploughing and harrowing and manuring were of no use to the crop, of course no one would go to any expense in cultivation. If the air provided all the food that plants need, people would not labour at their gardens, they would just sow their seed, and then pray for the wind to blow and the rain to fall, and the sun to shine, till the crop was ripe; then indeed, they might have to wake up for harvest time. But it has been so arranged that plants require our labour both at seed-time and harvest, and all the season through, in order that they may yield their utmost; and thus employment, as well as food, is provided for man.

Now let us return to the case of one tree. We have proved that its substance did not come from the soil; for the matter of wood is not in the soil in quantity enough, and the plant cannot change one thing into another — and as the air is the only other thing that the plant has access to, the inference is that it must get its substance thence. Well, but you will say, "If the wood is not in the soil it certainly is not in the air. There is nothing solid or substantial in air like the matter of wood must be." I think I can prove to you that there is something like the matter of wood in the air, nevertheless. Suppose that you cut down that tree, which you say could not have come out of the air, and set fire to it, and leave it for a little while—on your return you find that it has gone—that it has burned up; where has it gone to? If it never was in the air before, it is in the air now, for certain; and the clear air into which it has been converted will go to furnish the matter of wood to other trees which are still growing. The tree did not all disappear, however. It left some ashes behind it. Well! the ashes of the tree are what it got from the soil, and they are thus returned to it; and whatever of the tree will burn or rot away back into the air, just goes to the place from whence it originally came. Plants make their growth by food from the mineral kingdom, which includes the air; and animals by food from the vegetable kingdom; but there is constantly this compensating process going on, that every plant and every animal that lives, eventually dies, and each gives back to the sources from whence it was obtained the matter of which it is made. I suppose that all the plants on the surface of the globe now, if weighed, would not be heavier or lighter than the vegetable covering in which the earth was clothed 5000 years ago; and I dare say that the quantity of animal matter now in life is not greater or less than the quantity which lived in any other year since the world was fully peopled. The plants take food from the earth and the air, and grow and feed animals, and these die and return to the dust, furnishing the earthy part back to the soil from whence it came, and the combustible part back to the air from which it came. You can imagine a farm which should be a little world by itself—large enough to maintain a family—it should provide the materials for their cottage and food for themselves; and Wheat enough should grow upon it, and sheep and cattle, and Flax and Grass should flourish there—so that woollen cloth and linen and beef and mutton and bread might all be made from it; and thus this family need never leave this bit of land, and it would, as I said, be a little world by itself. Now the soil furnishes its portion, *i. e.*, their ashes, to the Grass on which the cows feed—and to the stems of the Flax and to the wool of the sheep and to the food of the people; but there is no fear of its being ultimately impoverished by this—for it gets it all back again very soon, for the cattle are killed and the men die—and the plants wither and the ashes of all are returned to the land whence they came—and the fuel is burned and the dungheap rots away in the ground, and thus all the part which was obtained from the air is returned also to it. There is no difficulty now in conceiving of such a farm as this yielding so many tons of cheese or so many bushels of Wheat every year without suffering. We know that this did not all come out of the soil, so as for us to be obliged to believe that there are hundreds of tons of cheese or of wood or of Wheat all in the soil now to furnish future crops; and we know that it did not *all* come from the air, so as for us to be obliged to believe that there is the matter of all the crops that shall be harvested, and all the timber that shall be cut to the end of time, now existing in the air ready to be used year by year as time passes. What we now know is this—that every year the soil contributes what may be called the mineral part of our crops—their ashes, in fact, if they were burned — and little else; and the air contributes almost all of the woody part of them — what would disappear if they were burned; and each in the course of a very few years receives back again to itself whatever each had given, ready to be used over again to make new crops and new produce—new food to feed another race of men. In the case of the farm that yielded the 5 tons of cheese every year—it does not lose 5 tons of the cheesy part of the soil annually, the soil has no cheesy part to lose—all that it loses is just such a quantity of earth as the ashes of these 5 tons of cheese would amount to if they were burned. What quantity

of ashes would be left by 5 tons of cheese if they were burned? a very few lbs.—and that is all the farm loses every year. Certainly it is not the common sand of the soil that exists in the cheese, but it is a part of the earth of the soil that is sent off with the cheese, nevertheless; a very small portion, however, and one which the soil could lose every year for a very long time indeed without being any the worse for it. I burned a 10 lb. Mangold Wurzel the other day, and here are all that remained of it; these ashes weigh about an ounce, all the rest of this root comes from the air, and it has all gone back to the air from which it came.

(To be continued.)

POULTRY MISCELLANIES.

For the sake of easy reference, numbers will be attached to a few miscellaneous facts and speculations on the subject of domesticated birds, which may from time to time be given in these columns.

1. "G. R. P." inquires "if there is any mode by which one can ascertain out of a brood of cygnets which are the males and which the females." In reply, let the birds be drafted off two at a time, taking as the first pair the very largest and the very smallest individuals of the brood; then the largest and the smallest that remain, as the next pair, and so on; these will probably be males and females, especially if the point that the males have the thickest neck coincides with this difference of size. But the individuals of a brood of cygnets do not vary so much as those of a brood of goslings or ducks, and it will often be difficult to decide on the evidence of these points alone. Contrive, then, to see the birds, close at hand, in the water, having the eye as nearly as may be on the level of the water and the swimming brood of cygnets. Those that swim deepest will be females, those that float most buoyantly will be males; the cause being that the females are furnished with a smaller proportionate bulk of lungs.

There is a mode of ascertaining the sex of living birds which is held as a great secret by some traders; it is effected by an examination, a description of which would be more *apropos* in a work on comparative anatomy than in the pages of this periodical. Those who can read Latin will find a clue to the mystery in Aldrovandi's "Ornithologia," tom. ii., p. 200-1; but the above-mentioned tests will be sufficient for an observant eye, particularly if an experienced swan-herd can be called into consultation. In looking over a full-grown brood, he will soon pronounce which are young cobs and which are pens.

2. Is a medical case, which shall be stated, as it is a very common one. "A Constant Reader" has a Spanish cock and hen, which are affected in a manner that causes a slight discharge from the nostrils, and compels them to make a noise as if sneezing, and resembling the word "pip." They are kept in a house which is perhaps rather small, but which he has taken every precaution to render dry and keep clean. They have the run of a good-sized yard, with access to a dust heap, &c. They are at present but slightly affected, and therefore their owner is the more anxious to find out a sure and speedy remedy, which we are sorry not to be able to suggest; for every poultry keeper will recognise in the symptoms described one of his greatest plagues and pests. The disease often proceeds to a fatal termination, but in its early stages at least is curable. Hot, dry, settled weather is the most efficacious remedy. All sloppy food should be prohibited to such patients, and they must have little or no water to drink; their diet should consist of Barley-meal—stiff, mixed with water or milk, Wheat instead of Barley as grain, and all the green food they choose in the shape of shred Cabbage leaves and Onion tops; Rice also boiled not too much, and sprinkled over with Barley-meal or fine pollard, is good. As soon as the birds are subjected to remedial treatment, a dose of jalap, or a calomel and colocynth pill, may be administered to each with advantage; but the drug which we have found productive of most evident benefit to sick fowls, is the plant Rue (we ought to add that Wormwood enjoys a similar reputation): it seems to act upon their constitutions in febrile cases in a similar way to what Peruvian bark, and its extract quinine, does on the human subject. It may be administered either by being chopped and mixed with their Barley-meal, or given in the shape of pills by means of some tenacious substance, or a decoction of it may be exhibited as the sole and only drink accessible to the patients. Their housing, too, must be attended to. A place may be clean and dry, like that of our "Constant Reader's," and yet be whistled through by cold draughts of air, enough by themselves to produce the disease. Frequent white-washing, caution against overcrowding, and the *daily eye of the master or mistress*, or of both, will be great safeguards against this, which may be called the protean malady of fowls; but, after all, we shall still find ourselves unable utterly to baffle the influence of an unfavourable season.

3. Henry C—— is in despair about muscovy ducks. He cannot succeed well in rearing them. After the young ones are hatched, they live from a few hours to two or three days, when they turn their heads under their breasts, and shut their eyes, and depart this life. Sometimes they eat, and sometimes they get (qy. take? or *can* get?) nothing at all. His Mrs. Duck is expected to enjoy the honours of maternity at an early period, and therefore he will be thankful to receive a little information as soon as possible.

The first hint which ought to be given is, that musk ducks are natives of the hottest regions of South America. The old birds may be what is called acclimated in Great Britain, but the newly hatched ducklings certainly are not. The term acclimation is, according to our notions, founded on a mistaken expectation, and made to convey to the mind a principle respecting the constitution of organised beings, both sentient and non-sentient, which is not borne out by the mass of facts. It supposes that, by time and perseverance, certain created things can be made to thrive, as well as if they were at home, in localities and climates greatly different from those which are native to them, and for the occupation of which they were not originally designed or adapted. The adaptation takes place through the lapse of years, aided by care and forethought—*à force des soins* would be the language of the French school of progressive natural historians. After a few generations a sort of compromise is supposed to take place between the unsuitable, ungenial climate on the one hand, and the tender greenhouse constitution on the other. Things shake together, and the foreigners are acclimated. Now, we hesitate to accept this popular theory, believing it to be founded on defective observations, and conducive to unsuccessful practice. We take the fact of the "acclimation" of any organic being to mean no more than that it is now bearing just such a measure of change as it was originally constituted capable of bearing, not that it has acquired any new powers of endurance.

Many of our settlements in valuable but unhealthy countries are occupied by successions of men, who are just as much "acclimated" by their residence in Calcutta or Sierra Leone as eels are really "used" to their skinning; or the circumstances, not the organic beings, change. A colony settles in a marshy region. Half the immigrants die. The other half recover from their ague fits, or linger under them; and, while so lingering and surviving, drain the marsh for their grandchildren to occupy in health, who, however, are said then to be "acclimated." We have seen the people who live in the Pontine marshes—of course we did not see those whom the malaria had killed—and they were "acclimated," that is, they were just not killed; they bore the pest for the present, but it had not become as natural to them as pure air and water from the rock. The tender annuals introduced into England 300 years ago are not less tender now than they were then. We cannot yet grow Kidney Beans in the open air during December and January; nor can Wheat be profitably cultivated above a certain latitude in Scotland, nor Maize and the Vine in France; nor the Citron family, nor the Olive, nor Rice, spices and cotton, beyond the bounds of their respective regions. If acclimation were a process really going on, the Oak on the mountain would creep up to the zone of Firs, the Firs ascend above the line of perpetual snow, and the rare Rush or Primrose, to which "alpine" is applied as its most apt epithet, would be found gradually sliding down to the temperature of the tropics. But history has no such facts to record. Some animals, birds, and plants are capable of *bearing* a great range of climate, others can bear very little. It is right and necessary to test such capability of change in the things that were created for our use; but if we find that they do not endure it, and try to make them do so, *à force des soins*, we shall probably only kill the poor blackamoor whom we want to wash white, and learn the vanity of waging war against Nature. So we return to the starting point, namely, that adult turkeys, guinea-fowl, and musk ducks live in the climate of Britain with comfort, nay pleasure to themselves, for great part of the year, but the younglings of those creatures require to have our climate and its circumstances acclimated to them.

Therefore treatment like that bestowed on farm-yard ducklings will not do for little Muscovies. They must be kept very warm and dry and snug. Their nurse, whether duck or hen, must be cooped in a sheltered, sunshiny nook. There must be no water to tempt them to dabble; for, remember, that in Brazil their first bath would probably be of a temperature that would grow the Victoria regia. They must have as much care and frequent attention as little turkey chicks. For food, bread crumbs, chopped egg, and boiled rice in abundance. If the boy cannot dig up a few nice little red worms four or five times a day, let them have raw beef minced fine, as for the chicks of golden and silver pheasants. Forget that they are ducklings, and treat them as the young of tender gallinaceous birds. Proceeding thus, a farmer of our acquaintance annually rears them with success. He has lately killed some fatted musk drakes, over-year's birds, it is true, which when dressed ready for the spit, weighed 8 lbs. each. We may now guess why so many more of them are reared in France, the South of Europe, and the United States of America, than in England. First-rate birds for the table, like those just quoted, deserve a little trouble, though it is not the fashion of the present day to bestow much upon them. Willughby tells us (p. 381) respecting "*The Guiny-Duck*: Anais Libyc, *Aldrov. and Bellon, which we take to be the same with the Muscovy and Cairo Duck*," that "A few years agone a certain kind of *Ducks* began to be kept in *France*, of a middle size, between a *Goose* and *Duck*, having a broken voice, as if it had distempered or ulcerated lungs. Now there is so great a plenty of them in our country, that they are everywhere kept in cities and publicly exposed to sale: For at great entertainments and Marriage Feasts they are sought for and desired." And so they would be now, if some dinner-giver of eminence and reputed taste would patronise them for a single London season, and immortalise his own name by a Canard de Moscovie, a la ——; one ought not to award the title prematurely. Willughby adds, "If it were not very chargeable [expensive? or troublesome?] many more of them would be kept than are. [Their usual price in Hungerford-market is now 10*s.* the pair, which will repay a few 'charges,' and it will rise if we can bring them more into fashion.] For if you give them but meat enough they will lay many eggs, and in a short time hatch a great many Ducklings. Their flesh is neither better nor worse than that of a tame *Goose* or *Duck*." We can dine, without murmuring, off either, properly accompanied.

The variety observable in musk ducks is a matter hardly yet explained, and deserving a little attention. Being natives of S. America, all the sorts were quite unknown in Europe till a certain date, which we may call recent. But in tracing back the history of the bird, we find that these varieties were a long time since as numerous as they now are, being quite puzzling to the naturalists of former days, till we contract the interval between the discovery of America and the recorded existence of various musk ducks to so narrow a space of time that it is impossible to suppose that these great variations could be produced by the effects of domestication, during that short interval—a supposition which becomes the more improbable when we reflect that the number and extent of those variations do not go on increasing. Willughby, whose Ornithology bears on the title-page the date of 1678, sums up respecting the Guiny Duck: "*This seems to me to be the very same Bird with Aldrovand's Cairo Duck, for most of all the marks do agree, as will appear to him who will take the pains to compare the descriptions; and also the same with our Muscovy Duck. For* Scaliger's *Indian Duck, which* Aldrovand *makes the same with his* Libyc, *is the same with our Muscovy Duck, or we are very much deceived. So that I strongly suspect our Muscovy Duck, the Guinny Duck of* Bellonius, *and* Aldrovand's Cairo Duck, *yea, and* Gesner's *Indian Duck, too, to be all one and the same bird, more or less accurately described. Perchance also the Birds themselves may differ one from another in those tuberous eminences and naked skin about the Bill, and upon the Bill between the Nosthrils.* * * * *Nor is the diversity of colours a sufficient argument to the contrary; for that they (as we have often said) in tame birds of the same kind vary infinitely.*" But Joannes Caius, the founder of Caius College, Cambridge, in his Libellus, or little book, on the rarer animals and plants, published more than a hundred years before Willughby's Ornithology, seems puzzled by some of the varieties of the musk duck. These varieties, then, were not probably self-generated in the old world, but imported from the new by Spanish and other adventurers. If they arose, hundreds or thousands of years ago, in South America, from a single uniform type of musk duck, it would be most interesting could we know under what circumstances of domestication by extinct nations of men, in cities that have long been swept away, the breaking of the breed first took place. One variety of musk dusk is coloured with a curious dingy brown. Now, domestic ducks, of a nearly similar hue, have this season been unexpectedly produced in our own poultry-yard. Thus, a perfectly black East Indian duck, associated with a perfectly white call drake, and with no other male. During the spring both birds were stolen by some vagabonds. The few eggs obtained from this union were set under a hen, and produced four ducklings, two speckled black and white, as might be expected, and two of the dingy brown colour, interspersed with a few white feathers. As we have suspected the slate-coloured fowls to have arisen from some dilution, with a white cross of black, *i. e.*, very dark purple or slate-coloured birds; so, in ducks, light or dingy brown may be the effect of diluting, with white, black, *i. e.*, very dark brown or brown-green families. The couple of brown common ducks look like a pair, in which case we propose keeping them another season to watch how their offspring will turn out.

A trustworthy account of the parentage and produce of mongrels is much required to assist in determining the limitation of the variations of species, a mere guess at which will be of such immense service to the speculative zoologist. *D.*

Home Correspondence.

The Risks of High Farming.—I have witnessed within these few years, in my own neighbourhood, so great a revolution in the culture of land, and such prodigious crops in expectancy arising from high farming, that when the seasons are favourable for harvesting, I might subscribe to all that is said—that, to look for great crops, the farm should be worked as a garden. Not three weeks ago I saw a large farm promising the cultivator of it a full realisation of all his hopes, and in truth, even to an inexperienced eye, the picture was magnificent; but such is not the case at present, its proud head is fallen with the heavy rains, and the sloven's on the other side the hedge sprinkled with its weeds (where high farming could not be followed for want of capital), may turn out the more profitable husbandry. A medium line in farming, perhaps, as in all other things, is best. Better to lay your plans for 30 bushels of Wheat per acre rather than 40, and then a day's rain will rather enliven than depress your expectancies of a good harvest home. But supposing it to be all truth, that high farming is the only, or rather the best, way to meet the imports of foreign grain and high taxation, where are the landlords or tenants of substance to be found to follow such courses? If it was as clear as that 2 and 2 make 4, that by right draining, subsoiling, and scientific knowledge of manure,

and plenty of it, that produce might be quadrupled, still to bring the country into universal garden culture is but an Utopian dream. "Progress" is a good horse, but a curb is necessary to prevent his running away with his rider. *Lt. H., July* 31.

Exeter Agricultural Meeting and Dinner.—The meeting at Exeter seems to have satisfied its promoters. As strangers, we say there is much to mend. For a show on so large a scale as the Royal Agricultural Society of England, it ought to be fixed at some central point. When fixed in a corner of England, as at Exeter, the show becomes of a local character—the subjects for exhibition become limited. Strangers find all things new; but where is the novelty of the show to those who may annually attend? In stock, for instance, you had what we expected to find, viz., some fine specimens of the Devon breed. In horses, no show at all. But many say, why waste your time looking at the beasts of the field? Turn your attention to the implements; see what is new; discover fresh traces of mechanical art and skill, and tell us what new things England has done towards a cheaper and better method of tilling the ground. Implements were once all complexity—all cost—monstrous, cumbrous articles. They are not yet done with. Many implements called new are only old acquaintances in a new garb; but they are admitted as new to the exhibition. Some of the ploughs, with mould-boards of unusual length, laid the furrow slice in an admirable manner. Much business was done in the sale of implements. The dinner was unusually satisfactory. Soyer did his part well, in a part the British farmer never fails when the viands are such as he can do justice to. At other meetings the dinners have been very indifferent. The speeches would have been better if Mr. Lister had had his say, and what he would have said is easy to divine. Many landlords want education, and where the landlords know their business they are the best and kindest of men. How wrong to say a gentleman wants instruction; but to say a tenant is ignorant is quite right. Pretty times these, forsooth. Who shall stay instruction, and who shall withhold knowledge? Does the Society deny its own usefulness? We should have been too glad to have heard from one from the further hemisphere the words he would have uttered; we mean Colonel Morris, of New York. But the rules of the Society silenced him, though the meeting called upon him by name. Mr. Rives, of Virginia, we would also gladly have heard. Virginia! so associated with our own great countryman Raleigh, so wise, so learned. The axe and the veto of a chairman can cut short instruction. However, in excuse it may be supposed the American guests might argue the question of free trade, and so put the meeting in hot water. At these meetings much information is obtained from men who attend from various counties. It is to be hoped Devonshire will improve after this visit of the Society. Cream and Apples are very good things, but good farming far better. *X. Y. Z., Hants.*

Public Well.—The poor around me are very badly off for water of any kind. I cannot afford to dig or bore a well for them, even if I had not to sink 130 feet, the probable depth through our clay. Can you suggest to me some cheap method of procuring them a good supply of wholesome water? (by drainage and filtration, or otherwise?) I find that the stone earthenware pipes are not made larger than 18 inches diameter; had they been 3 feet, they might have been available to line the well. And what could a pump be bought for? and what sort of pump? And what rules should the people be bound by, if any? *J. E. G.*

Clover Failure.—On seeing your article in the *Agricultural Gazette*, on the failure of the Clover, I was induced to seek for the cause. Upon examination I find the Clover very much eaten with a small black-headed maggot, which destroys the heart of the plant. The stems are also pierced with many holes, apparently by some insect depositing its eggs. This is not local; for I have examined many Clover fields, some more than 40 miles from where I reside, which are precisely the same. It is not confined to this time of year or this particular year. I have found it at all seasons in the absence of frost. I had the whole of three or four acres destroyed early one spring. Some Trefoil sown and growing with the Clover was not injured. In the second cut or after crop many patches of the same field were destroyed where it had not been injured first. In the following spring, early (February and March), a neighbour of mine had a field of 12 acres quite destroyed. There was a uniform and good plant after harvest, and all the early part of the winter, which became so bad by late in March as to be fit only to plough up and sow with Peas. The crowns were eaten out by this maggot; it began in spring and finally spread all over the field. I am not sure, but think I sent you some notice of it at the time; if I did not I intended it. About the same time I saw an article by Mr. Lawes on the same insect, and I think he said it belonged to the Tipula family, this maggot being their larva. I feel assured the Dodder is not the cause of the failure; I have seen it only in the second cut or late in the summer; nor the Broom-rape, but some insect. I can bear testimony as to the good effects of bones dissolved in acid as a good dressing for Clover, having this year quite a double crop where it was applied, as compared with some missed on purpose in the same field, only a rod wide, as an experiment. I have found the Cow-grass succeed much better than Clover of late years, especially on poor land; it has this disadvantage, it is later, and does not produce a second crop, unless cut very early the first time. The Potatoes are very badly diseased here, I think they were never worse. Wheat will be only a middling crop, blighted, and very much down where heavy; looks like a deficient yield. Barley good but very much laid. Oats pretty good. Turnips promise well. The hay crop short. We have commenced cutting winter Beans to-day; they are a light crop. Peas that were sown early are a fair crop, on early land; but those sown late, on late land, are very bad. Mangold Wurzel very bad. We also began cutting Wheat to-day. The weather is showery, and not at all settled at present. *James Eames, Beck Farm, Beaulieu, Hants.*

English and Scotch Farming (see p. 475).—Before leaving Sandinburgh I made myself perfectly acquainted with the various systems adopted on that farm, for we have very few instances where all the branches of farming are so scientifically carried on, and that too without any ostentation or view to applause. It has been the desire of the manager to make the best of his master's property, by adhering to principles he found most conducive to that end; for while he has devoted so much attention to the breeding department, the other branches connected with the farm have not been lost sight of. After leaving Hertfordshire I passed through Middlesex, in order to see haymaking at head-quarters; the weather being fine, the process was going on with vigour, which I had great pleasure in witnessing, and was quite ashamed of the ignorance which prevails in the north in that department. Before drawing to a conclusion, I shall state my opinion on the comparative merits of English and Scotch farming. In England the systems of farming and modes of management are very different. In some districts it is very deficient, while in others good farming is to be found. And, to their praise be it said, the proprietors (or their managers for them) generally set a good example before their tenantry; but the latter are rather tardy in the progressive movement. However, in Scotland, it is quite the reverse; here the tenantry live at rack-rent, with very few resident proprietors, and those we have occupy only the mansion-house, and perhaps a few acres adjoining, which are kept in permanent pasture, consequently the tenant farmers have the way to find for themselves, and to them is due all the praise of Scotch farming. In conclusion, I wish it to be understood that it is not my intention to applaud one party and despise the other, as is too often done by writers on agriculture. My observations are drawn from facts that have come under my notice. I am likewise aware that the Scotch farmers consider themselves superior to their southern brethren, and in some branches they are so; yet, in some respects, they ought to borrow a leaf from the Englishman's book, as in haymaking, cattle-feeding, &c. And I trust our northern worthies will soon see the error of their ways in these respects; but I am afraid that the great barrier to all improvements has too much hold—that is, self-conceit. *H., Aberdeenshire.*

Clover Dodder.—A correspondent says, some eight or nine years ago I walked into my neighbour's field while he was cutting his second crop of Clover, and called his attention to the "Orobanche," which was most abundant therein. He had not observed it; and but for me would not have recognised anything unusual. This summer the field is in Clover again. After last harvest the plant was a full one. During winter and spring it went off sadly; so much so that the occupier, not the old tenant, ploughed up a part of the field. He and others could not account for the failure: they gave no heed to my suggestion, that the last time the field was in Clover it was poisoned with "Orobanche." "None had been seen since that time," &c.; and it could not possibly be that the present failure was due to such a cause. To-day I looked over the hedge; and there is my old friend in full vigour. Now then comes the philosopher's turn. Tell us where the poison has been laid up all this time, &c. The field seems to be ruined for Clover. [So far as I know anything of the natural history of the Orobanche minor, and the manner in which our occasional Clover failures occur, I am not disposed to consider the former to be in relation to the latter. No doubt the Orobanche does great injury where it abounds, but the Clover failures occur often where Orobanche is not found. I am not at all surprised that the Orobanche should re-appear in any field where it has once shown itself, for I think it extremely likely (don't suppose I mean to say it is a proved fact) that its seeds may remain dormant until they meet afresh with the roots of Clover or such other plants as they are capable of attacking. But—query 1st—Had your neighbour thoroughly cleaned his seed by sifting out the Orobanche? Query 2d,—Is the Clover "going off" this year? I mean since the winter and spring failure. Did you remember to try the experiment I have so often asked for—of leaving a stetch of Barley without Clover? Unless we begin at the beginning, I fear we shall always be in doubt of the real cause of Clover failure, and consequently a long while in detecting an adequate remedy. *J. S. H.*]

Notes on No. 30 Agricultural Gazette.—Leases, &c., (p. 473): "It is because we believe that this high farming cannot exist without a lease, any more than a lease without its invariable concomitant high farming, that we direct attention to their connection," &c. The former part of this proposition should be strenuously urged, especially in these difficult times. Without long or renewable leases, in all cases attended with a covenant for the repayment of all un-worn out improvements, we cannot expect any prudent man to incur the expense of real high farming. But the latter part of the proposition must be received with caution. Some landowners and agents, who wish to promote high farming, would grant leases, but their old tenants, whom they are unwilling to remove, are unfit to be trusted with them. Some years ago I was requested to accompany two other farmers to inspect and report the condition of a farm that was let on lease. The tenant paid his rent, but was ruining the farm, and though he had virtually broken through the spirit of the agreement, he had not so flagrantly violated its letter as to make ejectment clearly legal. We therefore unanimously agreed to advise the owner to get rid of the tenant on the best terms that could be agreed upon. I mention this fact because several similar cases have occurred, and it is to be hoped that qualified agents may devise some plan by which, under lease, the rights of both landlord and tenant may be made sure. I say qualified agents, because I quite concur in a recent remark of yours that properly qualified land-agents and landowners are wanting as well as superior tenants. And I will add my own opinion that if the former had been more plentiful, the latter would not have been so scarce.—"Manure for every crop:" This I nearly accomplished many years back, and sometimes got too much straw, on a poor run-out farm; and after the few first years, almost without purchasing any kind of manure, except such as could be bought by labour on the farm. That was effected by carefully collecting and preserving anything capable of making manure, and especially preserving the liquid manure, which was chiefly converted into compost by absorption with dry earth and ashes, and which was thus made drillable with the seed. Let the farmer free himself from the imposition of the manure manufacturer by manufacturing his own manure. I cannot think that farm rightly managed that does not maintain itself, unless the manure-making produce be sold off; in which case, of course, extraneous manure must be brought back. This self-supporting system is exemplified by Mr. Hutchinson at Sandinburgh (*vide* page 475), and it has been proved practicable in numerous other instances; but the gaseous virtues of manure, as well as the liquid, are most sadly wasted, instead of being, as they ought to be, preserved with miser-like care. Farmers too commonly seem to have no idea of the immense loss they sustain by suffering their middens to "waste their fragrance on the desert air." Suppose the tea-dealer were to expose his tea to sun and air, wet and wind, what would the women say of it? Methinks he would soon lose their custom, and this is only a parallel case.—"Catch-meadow," (page 474): This paper presents a promissory note to the owners of moory mountains and other lands where streams abound. Will they still refuse to accept it? I have often wondered that such sources of wealth should be so sadly neglected. *An Old Farmer.*

The Exeter Show of Pigs.—I see you say in your description of the pigs exhibited at Exeter, "The Berkshires are much too coarse in bone and hair for the small breeds, and have not sufficient size for the large." I am not very fond of public scribbling, but I cannot allow you and your readers to rest under this impression, without expressing my dissent. I believe it will be generally allowed that the pure Berkshire (it is too much he practice to call all black and white pigs Berkshire) are as fine in the bone and hair as any breed of the same size, and I feel confident will produce a greater weight of bacon at an early age than most other breeds. I have myself had them killed, weighing upwards of 20 score at 10 months old. I conceive that early maturity is of the first importance in all descriptions of stock, and should be particularly encouraged by all agricultural societies, and it was with this view I selected my pigs at Exeter, where I sent a sow eight months old, within two or three weeks of farrowing; of course she was much smaller than those four or five times her age, and was little noticed by general observers, but I understood she was pronounced a very superior animal by those who took the trouble to investigate the circumstances. Had I thought it necessary a sow should be a certain weight to gain a premium, I could have sent one equal to any there; but if I had been successful I should not have taken great credit to myself in gaining a prize for a sow three or four years old, which ought to have been converted into bacon years before. If a person looks alone to the bacon market for his return, I think he should not allow a sow to have more than one litter, and that before she is 12 months old; and if she is then fattened she will be nearly as valuable per score as young stores, which should be brought out at 8 or 9 months old; but if she is allowed to continue breeding, her bacon would be less valuable in proportion to the time she is kept on. I candidly confess I do not carry out this plan myself, as I am a breeder of pigs for sale to breeders, and sometimes have a greater demand than I can supply under this system, and am consequently compelled to keep on sows longer than I should otherwise do. I hope nothing I have said here will be attributed to dissatisfaction at the decision of the judges. I am perfectly satisfied—indeed no man should show at such exhibitions who cannot be defeated with temper. I always think the judges have a most arduous and unthankful duty to perform, and I am sure, so far as I have seen, always give their best attention to arrive at a right decision; and we the exhibitors, I hope, feel sufficiently thankful for the trouble they must have, although we may now and then feel a little disappointed. *Edward Bowly, Siddington House, near Cirencester, Aug.* 1.

Scotch and English Farming.—Being at all times desirous, like your Aberdeen correspondent, of learning

something in every country, and from every source, I feel the more stimulated, in these times of agricultural transition and distress, to pick up whatever conduces to make farming profitable. I am the more encouraged, from the liberal nature of your correspondent's introductory remarks, to hope for some detailed information regarding the stock and crops he witnessed at Sandinburgh. He says the crops were startling, and had been produced without the aid of artificial manures—save a few cwts. of bones, &c. I would therefore first beg to learn from "H.," what course of farming or cropping is pursued to obtain such a desired result. Next, I would like to learn how calves bought in at 15*s.* and 20*s.* respectively are made to be worth as many pounds in the course of a year or two's feeding? I should feel grateful to be informed how such stock is obtained, fed and treated; and what market, whether at home or in London, such animals are disposed of? We have been very far behind realising any such prices for two-year-old cattle, on an average, although well fed during the whole time from being calved till they came to the hands of the butcher. In the next place, we are most particularly desirous to learn the pig secret of a profit of 200*l.* a year. How that is obtained? What number of pigs are kept at Sandinburgh? How are they fed and otherwise treated? We have come so far short of anything like 200*l.* a year profit on keeping a very large herd of pigs, that we will venture to hire a special train for the northern luminary, to come and enlighten us upon the why and wherefore such a most desirable profit can be netted by pig feeding. If all your Aberdeen correspondent has stated of the farming of Hertfordshire be correct, England surely cannot be so very far behind Scotland, as regards its agriculture, as "H." and many other flying visitors would make us understand. We have at present no time to dive farther into "H.'s" budget, but shall have very many more enquiries to make, if he gives a full explanation to the statements in a late *Gazette*. *Investigator.*

The Potato Disease.—In the month of March last I sent you some account of my experiments in Potato planting, with a view to preventing the disease that has affected this root more or less since 1845. I then stated that the only Potatoes I had last year free from disease were those managed on the plan suggested by Mr. Martin, of Dundee, which consists in laying down the tops and covering them with earth to within 6 inches of the end. This should be done at the third moulding up, when the tubers are about half-grown, unless blight should appear on the leaves before this, in which case the operation should be immediately carried out—Mr. Martin's theory being based upon the supposition that the stems of the plant are in the first instance made unhealthy by atmospheric causes, and that then the sickness descends by degrees to the roots, and finally the tubers become diseased. Possibly this operation of covering up the stems may for a time check their growth, and thus prevent them acting as feeders to the tubers, thus leaving them to gain their whole growth from the soil and the gases contained below, instead of feeding on the deleterious atmospheric agents that from some peculiarity of the season may be blighting the stems above ground. I am sorry to say that such appears to be the character of the present season. The almost incessant rain and absence of sun for the last 10 days, has produced upon the leaves and stalks of the Potato plant, all the old fungus and black spots and blight, indicative of the coming disease of the tubers, and this to an extent far beyond any year since 1845. On a close examination of 150 acres of my own growth, and many fields besides of my neighbours, I cannot find a single plant that is not infested with the Aphis vastator and other green flies, that are always found accompanying a diseased state of foliage. These insects seem to have appeared all within the last week; they are to be found in greatest abundance on the lower stalks nearest the ground, which are becoming quite yellow and dead, and in some fields are to be seen patches 4 or 5 yards square of plants, altogether withered and mouldy. Should this damp weather continue many days longer, I fear the worst results to the whole crop, and I would now urge upon all, whose crops may be in a similar condition to my own, to try this "laying down" plan, at any rate upon a portion of them. The tops require first pressing down gently but firmly, with a short pole, held with both hands in the middle. A boy will thus press down as fast as three men can cover up with hoes, leaving about 6 inches exposed. The tops are laid all in one direction, and this should be towards the north, where the drills run east and west, as the bank of earth is thus most exposed to the sun. I have not yet been able to get a plough made that will perform this work with the precision required, but if the plan is found to answer, some ingenious mechanic will soon be found to produce an efficient implement of the kind. I may add that the cost of laying down upon our light soils is about 3*s.* per acre, an insignificant sum compared with the probable advantage, so that none need be deterred from making the experiment, owing to the expense. And yet I have observed that farmers in general are exceedingly averse to trying any new suggestion, however rational it may seem, that entails upon them even the slightest increased expense. Surely this deficiency of enterprise and spirit of enquiry, must be regarded as a great defect amongst the large mass of farmers. Even the most pertinacious stickler for his order must admit that there is amongst the farmers, as a body, a most lamentable absence of these requisities for that intelligent and scientific pursuit of agriculture which is demanded by the necessities of the "times," and in accordance with the present spirit of the age, and which can alone befit them for the pursuit of such enquiries as may lead to the solution of the mystery that now envelops the Potato disease. Their almost entire ignorance hitherto, of physical science, and nearly all the branches of natural history, has been shown by the crude and all but useless essays on "Turnip-fly," "wire-worm," and "blight," that have from time to time filled the pages of some of our agricultural publications. And it has mainly been by scientific men, altogether unconnected with agriculture, bringing to our aid those enlightened habits of observation gained by study and education, that we have been enabled at length to arrive at any just conclusions on these subjects. Surely it is a disgrace to the British farmer of the present day to be dependent on foreign aid in those matters so intimately connected with his own business, and so constantly thrust before his attention, that the only wonder would seem to be, how he can avoid the accession of knowledge upon such questions. But however just in general the charge may be of defective education amongst the main body of the farmers, still that can hardly be urged as the cause of the world's remaining till now in ignorance of the Potato disease. For we have had essays upon it from all quarters, by all "sorts and conditions of men," from Mr. Alfred Smee, with his science, down to the stupid practical bigot, who, with a laudable pertinacity, persisted in tracing it, like all other ills, to free-trade! and that still more remarkable individual, whose impious fanaticism could see nothing in it but a mark of the divine displeasure, at our toleration of the Catholics, and the threatened admission of the Jews into Parliament. And yet no decided light has been thrown upon the subject, opinions remaining as various and uncertain as ever. I have all along felt this to be a humiliating fact, for I cannot but believe that intelligent and patient observation should reveal the source of the injury, and reward the enquirer with some decided views as to the future fate of the Potato plant. I have no sympathy whatever with those half fanatic reasoners who strive to hide their ignorance of the operations of Nature under the assumed guise of religious "resignation to the mysterious workings of Providence," who say that doubtless some wise social end is to be answered by the total annihilation of the Potato plant, and assume that probably the Creator is gradually destroying, by direct agency, this root out of the land, without the intervention of any of those intermediate agents, such as blight, fungus, or insect working in the ordinary course of nature. And moreover, that it is presumptuous in us to attempt to ascertain the causes of such mysterious providential visitations. Now, there is nothing, in either the physical or moral history of man, that justifies us in coming to any such conclusions, for in both physical and moral disease we are taught by nature and revelation to fathom their sources and search out the remedies. And in both do we find that there is no evil which is not met by a suitable antagonistic healing agent. In the physical constitution of man, we see that beautiful law the "vis medicatrix naturæ," that, if unobstructed, speedily restores any injured part to its natural health again, and so likewise, in the intellectual and moral constitution, that which at first sight might seem an evil is often the agent of highest good. The *rationale* of the whole being embodied in three short words "perfect through suffering." Why then should we not carry out the same reasoning into the natural world? And thus we should look to that which is probably the true source of the Potato disease, viz., some unnatural condition into which our mode of cultivation has forced it. I hope that these suggestions may be received in the spirit in which they are intended. *John Fryer, jun.*

Foreign Correspondence.

Launceston, Van Diemen's Land, *Feb.* 3, 1850.—I have observed frequent discussions as to the qualities of guano imported from various countries into Great Britain, and hope you will not be displeased at receiving from Van Diemen's Land a communication having reference to guano, lately introduced there, having been obtained from a cavern on an island in Bass's Straits.

The persons who discovered this cavern say that it is occupied by innumerable sea birds, and that the guano contained in it is completely sheltered from the weather, and that no rain can have fallen upon it. About 20 tons have been brought to Launceston, and bought by various parties at 5*l.* per ton. Amongst others, I purchased 4 tons, and having dried and pulverised it, and mixed it with an equal quantity of wood-ashes, I have within the last month sown it at the rate of 3 cwt. to the acre, upon land since sown broadcast with Yellow Aberdeen and Red Tankard Turnips. Being very desirous to ascertain the value of this guano, as compared with that in use in England, and believing that you will, in a measure, feel interested respecting it, I have herewith forwarded you a small quantity of the guano as it arrived in Launceston, together with the remains of some birds I took out of that which I dried and pulverised, which abounded in similar remains—bones (apparently of albatrosses, penguins, and other large birds) and partially decomposed feathers.

If you can kindly submit this guano to be analysed by some competent person, and communicate to me the results, either by letter or through the columns of your Journal, stating at the same time its value per ton, having reference to that of the guano most approved of in England, you will confer not only a favour, but a benefit upon the agriculturists of this colony, which will, I am sure, be duly appreciated by them.

In order that you may see that the communications in your Journal are not only read, but in some degree acted upon in this distant colony, I herewith forward you a *Launceston Examiner*, of July 1, 1848, containing a letter from me, describing, in compliance with the request of the Launceston Horticultural Society, the method I had adopted in transplanting Swede Turnips (taken, as you will perceive is acknowledged, from your columns), and stating the results. I may add that the next (last) year I put in 10 acres in a similar way, and had an excellent crop, one small field, containing about 1½ acre, yielding 30 tons to the acre, as I found by carefully weighing an average rod, in order to ascertain how long I could continue to feed two oxen that I was desirous to keep on until Christmas. This season I I have put in 20 acres, and have now about 13 or 14 acres promising an abundant crop; the remaining 7 acres were totally destroyed by grubs, which lived altogether upon the plants, there being no weeds in the field. *Theodore Bartley.* [We regret to say that we have not received either the guano or the Launceston paper.]

Societies.

AGRICULTURAL IMPROVEMENT SOCIETY OF IRELAND.

Cork, *July* 23.—This Society held its great annual show at Cork, on this and following days, in the spacious Corn-market. The weather, with the exception of a few passing showers, was particularly favourable, and the attendance numerous. The following is the prize list:—

CLASS A.—SHORT-HORNED.

Judges—Mr. J. Booth, Mr. Wm. Torr, and Mr. H. Smith; Stewards—Lord Viscount Monck, and Thomas Ball, Esq.

Section I. For the best Bull calved in 1845—48, 30 sovs., to Hon. A. F. Nugent, Pallas, Tynagh, for Bamboo, calved Jan., 1847; the best bull in Sections I., II., and III., and the best of all the prize bulls exhibited at the show; 10 sovs. to James Douglas, Athelstaneford, Drem, East Lothian, for Hutton.

Section II. For the best Bull calved in 1848, 20 sovs., to W. Coppinger, Barry's Court, for Rollo; 5 sovs. to Harvey Combe, Cobham Park, Cobham, Surrey, for Logic.

Section III. For the best Bull calved after the 1st of January, 1842, 10 sovs., to Richard Welstead, Ballywalter, Castletownroche, for Peacock; 5 sovs. to Richard Chaloner, Kingsfort, Moynalty, for Duke of Leinster.

Section IV. For the best Cow in calf, or that has had a calf in the year 1850, 15 sovs., John J. Turner, Newtownvilla, Kilcullen, for Primrose; 5 sovs., to Hon. A. F. Nugent, Pallas, Tynagh, for Bandbox.

Section V. For the best Heifer, in calf or in milk, calved in the year 1847, 10 sovs., to Hon. A. F. Nugent, Pallas, Tynagh, for Maid of Killerby; 5 sovs. to H. Stanley M'Clintock, Newbury, Kilcullen, for Lily of the Valley.

Section VI. For the best Heifer, in calf or in milk, calved in the year 1848, 10 sovs., Benjamin Wilson, Brawith, Thirsk, Yorkshire, for the Lady of Brawith. This Heifer also received the Agricultural Challenge Cup, value 100 sovs., as being the best animal in the Neat Cattle Classes; and the gold medal as the best of all the prize cows or heifers exhibited at the show. The owner also received the medal as the breeder of the best prize animal; 5 sovs. to Benjamin Wilson, Brawith, Thirsk, Yorkshire, for Castanette.

Section VII. For the best Heifer calved after the 1st of January, 1849, 10 sovs., to Thomas Barnes, jun., Westland, Moynalty, for Primrose; 5 sovs., to Hon. A. F. Nugent, Pallas, Tynagh, for Baby.

CLASS B. — LONG-HORNED, DEVONS, HEREFORDS, AYRSHIRES, POLLED ANGUS, AND GALLOWAYS. Or any other distinct Breed not qualified to compete as Short-horns.

Section I. For the best Bull calved in 1845—48, 15 sovs., to Lady Carbery, Castlefreke, Rosscarbery, for a Devon bull, Sir Thomas; 5 sovs., to Thomas George Stoney, Kyle Park, Borrisokane, for his Hereford bull, Ireton.

Section II. For the best Bull calved in the year 1848, 10 sovs., to the Earl of Charlemont, for his Devon bull, Young Shamrock; 5 sovs., to the Earl of Charlemont, Marino, Clontarf, for his Devon bull Volunteer.

Section III. For the best Bull calved after January 1, 1849, 10 sovs., to the Earl of Charlemont, for his Devon bull Albert; 5 sovs., to N. W. Roche, M.D., Carrickabrick, Fermoy, for his Ayrshire bull Rory.

For the best Bull in the above sections, The Medal. The Earl of Charlemont, for his Devon Bull, Young Shamrock.

Section IV. For the best Cow in calf, or that has had a calf in the year 1850, 10 sovs., to the Earl of Charlemont; 5 sovs., to John M'Auliffe, Rathminsky, Cork, for his Ayrshire Cow, Dearie.

Section VI. For the best Heifer in calf, or in milk, calved in the year 1848, 10 sovs., to Lady Carbery, for a Devon Heifer, Daisy; 5 sovs., to the same for a Devon Heifer.

Section VII. For the best Heifer calved after January 1, 1849, 5 sovs., to the Earl of Charlemont, for his Devon Heifer, Primrose; 3 sovs., to Thomas Kemmis, Killeen, Portarlington, for his Jersey Heifer.

CLASS C.—WEST HIGHLANDS, KERRIES, OR ANY OTHER MOUNTAIN BREED.

Section I. For the best Bull calved after the 1st of January, 1844, 5 sovs., to William Owen, Blessington, for his West Highland Bull, Young Donald.

Section II. For the best Cow in calf, or that has had a calf in the year 1850, 3 sovs., to Thomas J. Fitzgerald, Thornbull, Cork, for his Kerry Cow.

Section III. For the best lot of two Heifers, 3 sovs. to the Knight of Kerry, Valencia, for his two yearling Kerry Heifers.

CLASS E.—HORSES.

Section I. For the best Cart Stallion, over three years old, and foaled since the 1st of January, 1843, 30 sovs., to John Woolsey, Milesdown, Castlebellingham, for his Clydesdale horse, No Mistake; 10 sovs., to the Earl of Shannon, Castlemartyr, for his Clydesdale Draught Stallion, Clyde.

Section II. For the best Cart Stallion, foaled since the 1st of January, 1847, 20 sovs., to William Owen, Blessinton, for his Draught Stallion, Kilwarlin.

Section III. For the best thorough-bred Stallion, the Medal. Captain Francis Price, Abergavenny, Monmouthshire, for his thorough-bred Stallion, Retriever.

Section IV. For the best Cart Mare, in foal, or with a foal at her foot, or having reared a foal in the year 1849, 10 sovs., to Joseph Nash, Monard, Cork, for his Draught Mare; 5 sovs, to St. John Jeffreyes, Blarney Castle, Cork, for his Cart Mare.

Section V. For the best Cart Filly, not exceeding three years old; 5 sovs., to Thomas Ball, Malahide, for his filly, Jessy.

SHEEP.

CLASS F.—LEICESTERS.

Section I. The best Shearling Ram, 10 sovs., to James Douglas, Athelstaneford, Drem, East Lothian; 5 sovs., Sylvester Rait, Rathmoyle, Edenderry.

Section II. The best Two-shear Ram, 10 sovs., to John Gregory Watkins, Woodfield, Worcester.
Section III. The best Ram of any other age, 5 sovs., to John Gregory Watkins, Woodfield, Worcester.
Section IV. The best pen of five Shearling Ewes, 5 sovs., to Roger Hudson, Kilmore, Tallagh (objected to).
Section V. The best pen of five Ewe Lambs, 3 sovs., to Robert Briscoe, Glandalane, Fermoy.

CLASS G.—ANY OTHER LONG-WOOLLED SHEEP.
Not qualified to compete as Leicesters.

Section I. The best Shearling Ram, 8 sovs., to Sylvester Rait, Rathmoyle, Edenderry; 4 sovs., to the same.
Section II. The best Two-shear Ram, 8 sovs., to G. Thunder, Kingston Lodge, Navan.
Section III. For the best Ram of any other age, 4 sovs., to Sylvester Rait, Rathmoyle, Edenderry.
Section IV. For the best pen of five Shearling Ewes, 3 sovs., to Stephen Wilson, Bookfield, Ballytore.
Section V. The best pen of five Ewe Lambs, 2 sovs., to James Morrogh, Kilworth.

CLASS H.—SOUTHDOWNS.

Section I. The best Shearling Ram, 8 sovs., to John Woolsey, Milesdown, Castlebellingham.
Section II. The best Ram of any other age, 4 sovs., to William Owen, Blesinton.
Section III. The best pen of five Shearling Ewes, 3 sovs., to James Hanning, Cloyne.

CLASS I.—CHEVIOTS.

Section I. The best Shearling Ram, 8 sovs., to Colonel La Touche, Luggela, Newtownmountkennedy.
Section II. The best Ram of any age, 4 sovs., to Colonel La Touche, Luggela.
Section III. The best pen of five Shearling Ewes, 3 sovs., to Col. La Touche, Luggela; the best in the above classes, the Medal, to John Gregory Watkins, Woodfield, Worcester; the breeder of the best Ram in the above classes, the Medal—to Gregory Watkins, Esq.

CLASS K.—SWINE.

Section I. The best Boar of the large breed, 5 sovs., to Edward Croaker, Ballitore House, Ballitore; the second best ditto, 3 sovs., to John Lichfield, Ballymaloe, Castle, Cloyne.
Section II. The best Boar of the small breed, 5 sovs., to Henry Lister Maw, Tetley, Crowle; the second best ditto, 3 sovs., to Alex. W. Lawe, Glanmire, Cork.
Section III. For the best Breeding Sow of the large breed, 4 sovs., to H. Stanley M'Clintock, Newbury, Kilcullen; 2 sovs. to Moses Cartwright, Staunton-hill, Brenton-on-Trent, Staffordshire.
Section IV. For the best Breeding Sow of the small breed, 4 sovs., to James Splaine, Gurrane, Bandon; 2 sovs. to Robert W. Goold Adams, Jamesbrook-hall, Middleton.
Section V. For the best lot of three Pigs of the same litter, not more than nine months old, 3 sovs., to Richard Barter, M.D., St. Anne's-hill, Blarney; 2 sovs. to Charles C. Coote, Mount-coote, Kilmallock.

CLASS L.—EXTRA STOCK.

Bulls: Thomas Connolly, M.P., Castledown, Celbridge, for his short-horned Bull Planet, 2*l*.
Cows: The Earl of Bantry, Glengariffe Lodge, Bantry, for his Cow and Calf, 2*l*.
Sheep: Wm. Owen, Blesinton, for a pen of three fat ewes, 2*l*.
Swine: Major Bush, Glencairn, Lismore, for a Boar and Sow, small breed, 2*l*.

CLASS M.—POULTRY.

Section I. Fowl.—The best Cock and Hen, or two Pullets, 2 sovs., Henry Barry, Barry's Lodge, Carrigtwohill; 1 sov. to Mrs. Warburton, Kill, Naas.
Section III. Geese: The best couple of Geese, 2 sovs., to James Perry, Glasheen, Cork; 1 sov., to Joseph Nash, Monard, Cork.
Section IV. Ducks: The best Drake and two Ducks, 2 sovs., to James Perry, Glasheen, Cork; 1 sov., to William Coppinger, Barry's-court.
Extra.—34, to Thos. O'Grady, Brynllithrig, St. Asaph, Flintshire, for a lot of Ducks, 10s.

CLASS N.—DAIRY PRODUCE—BUTTER.

To the owners of dairies, who shall make and produce the best quality of butter for the London and foreign markets, made on their own farms during the season of 1850, not being less than one firkin, of 70lbs. weight, on the following terms:

Section I. For the English or London market. 1st prize, 5 sovs., to Nathaniel C. Martin, Buttrestown, Glanmire; 2d. 3 sovs., to Richard Barter, M.D., St. Anne's Hill, Blarney; 3d, 2 sovs., to William R. Meade, Ballymartle, Kinsale.
Section II. For the Foreign market. 1st prize, 5 sovs, to John M'Auliffe, Rahmineky, Cork; 2d, 3 sovs., to Thomas Forrest, Clogheen, Blarney; 3d, 2 sovs., to John M'Auliffe, Rahminsky, Cork. For the best of all prize butter exhibited at the show, the medal No. 22, to Nathaniel C. Martin, Buttrestown, Glanmire.

Miscellaneous.

Agricultural Produce in Lancashire.—The following scale may be considered as the general rate of produce in this county, comparing the average produce of the county, per acre, with that of the best cultivated farms; the variations of the latter being according to the quality of soil and the seasons.

	Average of the County.	Best Cultivated Farms.
Wheat,	24 bushels,	from 36 to 48 bush.
Barley,	36 ,,	,, 55 ,, 65 ,,
Oats,	40 ,,	,, 70 ,, 80 ,,
Beans,	30 ,,	,, 40 ,, 50 ,,
*Potatoes,	6 tons,	,, 10 ,, 12 tons.
Turnips,	18 ,,	,, 26 ,, 36 ,,
Clover, two cuttings,	2½ ,,	,, 3½ ,, 4 ,,
Meadow hay, one ditto	1½ ,,	,, 2 ,, 3 ,,

The produce of cheese from a well-fed dairy stock, properly taken care of in other respects, will be double that from a stock under indifferent management and ill fed. This is supposing the dairy-maids to be equal in their management; but the value of the produce would be still less in proportion, when a bad dairy-maid is coupled with a badly fed, ill managed stock. The cheese made in the neighbourhood of Leigh has been considered the best in the county; but I consider the best dairies in North Lancashire are quite equal, if not superior, to the best "Leigh cheese." The highest produce I am aware of, for a whole dairy, is 4 cwt. per cow in the season. The general average will be about 3 cwt. per cow. The highest produce for one month (the first month at Grass in the spring), was from a dairy of six cows; 30 days' produce of which was 720 lbs. The value varies more in proportion from a cow, supposing full milk cheese is made. *Rothwell's Agriculture.*

* From crop 1841, one farmer sold 4500 loads, of 252 lbs. from 36 acres, which is better than 14 tons per acre.

Calendar of Operations.

AUGUST.

Lammermuir Sheep Farm.—During the past month the thermometer has been high, and the quantity of rain limited, though quite sufficient, except on very burning soils, to keep the pastures abundant. Indeed the present summer, so far as it has gone, has been very favourable for grazing farms, and sheep are looking well, notwithstanding the late and severe spring. Since the fleeces were removed, the principal work of the shepherds has been—keeping a sharp look out for maggots, which, from the warm weather, have been unusually troublesome of late. When the skin is unbroken, perhaps the best, and certainly the simplest, application is a handful of dry earth rubbed into the part affected, after carefully removing every maggot, and if possible the wool should never be removed, as it greatly disfigures lambs, especially if it is intended to show them in a market. The dust acts by quickly absorbing all moisture, and thus preventing the flies from depositing fresh eggs, while it also puts a stop to the operations of any larvæ which may have been missed. Our wool has been sold at about 25 per cent. above last year's price, and, judging from the appearance of the fleeces, we expect the clip to weigh well. The Cheviot lambs will be weaned on the 9th, and the best wedder lot exposed at the great lamb fair held at Melrose on the 13th. Our hands are busy ploughing, horse and hand-hoeing Turnips, and hay-making. All the Turnips are now pared with the small one-horse plough, and the half are horse and hand-hoed. The latter operations would have been finished ere this but for the hay-making. As the Clover hay is now all in ricks, we hope to get a few days to finish the Turnip work before regularly commencing the meadow hay. Turnips are growing admirably. Indeed, throughout Berwickshire generally, we have seldom seen this crop so forward at this date. There is an old saying, that if Turnips are meeting in the drills (30 inches) on the 5th of August, they will be a heavy crop. This year there will be few fields which are not in this condition. Grain crops all promise well, and harvest in the lowlands will begin in about ten days. *A Lammermuir Farmer.*

Notices to Correspondents.

Books: *B T W.* Low's "Elements of Agriculture" or Stephen's "Book of the Farm." The "Cyclopedia of Agriculture," by Messrs. Blackie, is not yet completed.
Caraway: *Attentive Reader.* Sow 1 gallon of seed in shallow drills 3 feet apart between the rows of Wheat early in spring. The land must be in good heart.
Horse-hoe: *Ignoramus.* The best horse-hoe for corn in drills is that manufactured by Garrett, of Saxmundham, Suffolk. It also answers for green crops sown on the flat. It cuts according to its width—which must be that of the drill by which the crop was sown.
Mildew: *A and A B Gregory* Your Wheat being "always more or less affected" would be liable to a severer a tack than usual this year on account of the late period of harvest and the very rainy weather of July. The attacks of mildew seem most frequent in cases of luxuriant and protracted growth—the germs of the disease seem present everywhere, ready to take advantage of the circumstances favourable to its development.—*Canfordiensis.* The mildew from which your Wheat is suffering is occasioned by the growth of a parasitic fungus—Puccinia graminis.
Moles: *J E G.* It is believed that they kill the wireworm. We do not suppose that Mustard kills or drives away the wireworm. It *may* have that effect on the fly from whose eggs the worm is hatched..
Potatoes: *Attentive Reader.* The names may be merely local—we should set Ashleaf Kidneys, Scotch Whites, Prolifics, and Axbridge Kidneys. None of them late Potatoes—but the last keeping well in spring.
Rusted Wheat: *Rev. F E.* You must wait till the Wheat is tolerably ripe—and then cut it down. If very badly injured it will be of use for little but chicken corn. Its fitness for seed depends on its present state of ripeness. That you must ascertain by trial in the garden, before use in the field.
Stable Dung: *Minimum.* Your most effectual way to rot it thoroughly will be by keeping the heap constantly damp throughout, and turning it once a month. To add sulphuric acid would not facilitate the putrefaction; that would probably be retarded by it. Sulphuric acid diluted with 10 or 12 times its weight of water, and in the proportion of 1 of sulphuric acid to about 150 or 200 of dung, is a good thing to add to the latter, in the case of putrefaction, as it will fix the volatile products of fermentation.
Tank: *J E G.* If you were to pitch in a few hundred weights of freshly burned charcoal dust, it might purify the water.
*** Communications reaching town after Wednesday cannot be answered the same week.

Markets.

COVENT GARDEN, Aug. 10.

Vegetables are abundantly supplied; Hothouse Grapes and Pine-apples plentiful. The supply of Peaches and Nectarines is well kept up. Ripe Gooseberries fetch from 2s. 6d to 3s. 6d. per half sieve. Oranges and Lemons though scarce are sufficient for the demand. West Indian Pine-apples are plentiful, and of tolerably good quality. Carrots and Turnips may be had at from 3d. to 6d. a bunch. Potatoes are plentiful and cheap. Lettuces and other salading are sufficient for the demand, and so are Mushrooms. French Beans are scarcer. Cut Flowers consist of Heaths, Pelargoniums, Lily of the Valley, Carnations, Picotees, and Roses.

FRUITS.

Pine-apples, per lb., 4s to 6s
Grapes, hothouse, p. lb., 2s to 5s
Peaches, per doz., 4s to 15s
Nectarines, per doz., 4s to 15s
Apricots, per doz., 1s 6d to 5s
Cherries, per lb., 1s to 1s 6d
Melons, each, 3s to 5s
Gooseberries, per half sieve, 1s 6d to 2s 6d
Currants, p. half sieve, 3s to 4s
Raspberries, p. pottle, 4d to 6d
Lemons, per doz., 1s to 3s
Oranges, per doz., 2s to 3s
— per 100, 8s to 24s
Almonds, per peck, 6s
— sweet, per lb., 2s to 3s
Walnuts, p. 100, 1s 6d to 2s
— p. bush., 16s to 24s
Nuts, Barcelona, per bush., 20s to 22s
— Brazil, p. bsh., 12s

VEGETABLES.

French Beans, p. sieve, 3s to 4s
Cabbages, per doz., 6d to 1s
Cauliflowers, p. doz., 2s to 4s
Peas, per sieve, 2s to 4s
Beans, per sieve, 1s 6d to 2s
Sorrel, p. hf. sieve, 6d to 9d
Potatoes, per ton, 50s to 80s
— per cwt., 2s 6d to 4s
— per bush., 1s 6d to 3s
Turnips, per doz. bun., 3s to 5s
Red Beet, per doz., 1s to 2s
Cucumbers, each, 1d to 9d
Leeks, per bunch, 2d to 3d
Celery, p. bundle, 1s to 1s 6d
Carrots, per doz., 4s to 6s
Spinach, p. sieve, 2s 6d
Horse Radish, p. bdl., 1s to 4s
Onions, p. bunch, 2d to 6d
— Spanish, p. doz., 1s 6d to 4s
Shallots, per lb., 6d to 8d
Garlic, per lb., 4d to 8d
Artichokes, per doz., 2s to 4s
Vegetable Marrows, per doz., 1s to 2s
Lettuce, Cab., p. sc., 2d to 1s
— Cos, p. score, 6d to 1s 6d
Radishes, p. 12 bands, 9d to 1s
Small Salads, p. punn, 2d to 3d
Mushrooms, p. pot., 9d to 2s
Fennel, per bunch, 2d to 3d
Savory, per bunch, 2d to 3d
Thyme, per bunch, 2d to 3d
Parsley, p. doz. bun., 1s to 2s
— Roots, p. bdle., 9d to 1s
Marjoram, per bunch, 3d to 9d
Mint, green, per bunch, 2d
Watercress, p. 12 bunch., 6d to 9d

SMITHFIELD, Monday, Aug. 5.

The supply of both Beasts and Sheep is considerably larger than on Monday last, consequently we have a reduction in price, on the former of nearly 4d. and the latter about 2d. per 8 lbs. Good Lamb is in request at fully late rates. Calves are not so plentiful, but it is difficult to make more money. From Holland and Germany there are 642 Beasts, 2970 Sheep, and 116 Calves; from Scotland, 200 Beasts; from Norfolk and Suffolk, 500; and 1500 from the northern and midland counties.

Beasts, 3587; Sheep and Lambs, 30,900; Calves, 264; Pigs, 210.

Friday, Aug. 9.

We have a large supply of Beasts; however, the dead markets being clear, and the weather favourable, trade is better. Prices have advanced about 2d. per 8 lbs. The number of Sheep and Lambs is also considerable; the former make more than on Monday, but the latter cannot be quoted higher. Although the supply of Calves is again large they are pretty freely disposed of, at an advance of about 2d. per 8 lbs.

MARK LANE.

Monday, Aug. 5.—The supply of English Wheat by land carriage samples this morning was smaller than this day se'nnight, and disposed of on the terms of last week. Foreign met but a limited inquiry, and prices may be considered nominally unaltered.—There was a fair demand for Barley, Peas, and Beans, at former rates.—Oats are held firmly for late prices, but the sale is slow.

Friday, Aug. 9.—The arrivals of English grain continue moderate, those of foreign large. This morning was again fine, and the market thinly attended; the business transacted in Wheat was to a most limited extent at late rates; a sample or two of new were shown, quality not fine, and being for future delivery, were not disposed of.—Barley was in fair demand, and fully supported our quotations.—Beans and Peas are quite as dear.—Oats meet a fair inquiry at former prices.—There has been but little passing in Flour, and it continues without alteration in value.—In floating cargoes of Indian Corn we have heard of no business, and prices remain unaltered.—Since the 2d inst. very heavy rains have fallen in various parts of the country, from whence, particularly this morning, the accounts complain greatly of the defect in the Wheat ear, mildew, rust, &c. A disease in the Potato, destroying the haulm, and in many instances causing decay to the roots, appears to be steadily progressing both in England and Ireland, and we hear of some complaints from Scotland, but whether it be the same as that of 1845 appears doubtful.

PORTRAITS OF HONORARY MEMBERS

OF THE

IPSWICH MUSEUM.

DRAWN ON STONE BY T. H. MAGUIRE, Esq.

Published for GEORGE RANSOME, F.L.S., Hon. Sec., to whom all orders must be sent.

DEDICATED, WITH PERMISSION, TO HER MAJESTY THE QUEEN and PRINCE ALBERT.

Ipswich Museum, 1849.

In presenting PORTRAITS of several of the HONORARY MEMBERS of the IPSWICH MUSEUM to the friends of its supporters, a brief explanation should be added of the motives which led to their publication. This Institution was established, in December 1847, mainly with the object of contributing towards the free instruction of the Working Classes in the science of Natural History, by providing for them a good Museum, Library, Lectures, and Classes. The object was no sooner known than the most cordial and generous offers of co-operation were made by many eminent naturalists, whose promises have been amply fulfilled, as opportunities have been afforded them.

Under a grateful sense of their disinterested kindness, I have been induced to present to our Members the Portraits of Gentlemen to whom we feel largely indebted for the prosperity which has attended the progress of the IPSWICH MUSEUM, at the same time I have hoped to confer upon them the only tribute of gratitude which it was in my power to offer, for the services and assistance they have rendered us—either by their interesting Lectures, or by their valuable donations to the Museum and Library. It was originally intended to have confined the issue of these Prints to the Members of the Museum, but so many applications for copies have been made by the friends of those whose Portraits have been taken, that I have obtained permission to issue a *limited* number of large India Proofs at 10*s.* 6*d.* each. They have accordingly been reserved for this purpose, and an early applications requested. Any profit that may arise from the disposal of these will be devoted exclusively to the funds of the Institution.

GEORGE RANSOME.

The following are now ready:

CHARLES LUCIEN BONAPARTE, Prince of Canino, Author of '*Fauna Italica*,' '*Continuation of Wilson's American Ornithology*,' &c.

SIR J. F. BOILEAU, Bart., F.R.S., &c. &c.

JAMES SCOTT BOWERBANK, F.R.S., L.S. and G.S., Author of '*Fossil Fruits and Seeds*,' &c.

THE MOST NOBLE THE MARQUIS OF BRISTOL, F.R.S., Patron of the Ipswich Museum.

VERY REV. WILLIAM BUCKLAND, D.D., F.R.S., L.S., and G.S., Corr. Mem. Inst. Fr., and Vice-President of the Ipswich Museum, Professor of Geology, Oxford, Dean of Westminster, Author of '*Reliquiæ Diluvianæ*' '*Bridgewater Treatise*,' &c. (From a Daguerreotype by Claudet.)

EDWARD FORSTER, F.R.S., F.L.S., Author of 'On *Vicia angustifolia*' in Linn. Trans.

JOHN GOULD, F.R.S. and L.S., Author of '*Birds of Europe*,' '*Birds of Australia*,' &c.

REV. J. S. HENSLOW, M.A., F.L.S. and G.S., Professor of Botany, Camb., Vice-President of the Ipswich Museum, Author of '*Principles of Descriptive and Physiological Botany*,' &c., &c.

SIR WILLIAM JARDINE, Bart., F.R.S.E., and L.S., &c., Vice-President of the Ipswich Museum, Author of '*The Naturalist's Library*,' '*Contributions to Ornithology*,' &c.

REV. WILLIAM KIRBY, M.A., F.R.S., L.S. and G.S., late Pres. of the Ipswich Museum, Author of '*An Introduction to Entomology*,' '*Bridgewater Treatise*,' &c.

JOHN LEE, LL.D., F.R.A.S., Author of '*Antiquarian Researches in the Ionian Islands*,' and Founder of the Hartwell Observatory.

JOHN LINDLEY, Ph.D., F.R.S. and L.S. &c., Professor of Botany in University College, London; Author of '*The Vegetable Kingdom*,' '*The Theory of Horticulture*.' &c.

SIR RODERICK IMPEY MURCHISON, M.A., F.R.S. and L.S., V.P.G.S., Hon. Mem. R.S. Ed. and R.I.A., M.Imp.Ac.Sc. St. Petersb., Corr. Mem. Inst. Fr., R. Ac. Ber., Tur. &c., Author of '*The Silurian System*,' '*The Geology of Russia and the Ural Mountains, Alps, Appenines, and Carpathians*,' &c., &c.

THE LORD BISHOP OF NORWICH, D.D., F.R.S., late President L.S. and F.G.S., Patron of the Ipswich Museum.

ROBERT PATTERSON, V.P. Nat. Hist. and Phil. Soc. Belfast, Author of '*First Steps to Zoology*,' '*Zoology for Schools*,' &c.

LOVELL REEVE, F.L.S., Author of '*Conchologia Systematica*,' '*Conchologia Iconica*,' &c.

PRIDEAUX JOHN SELBY, F.L.S. and G.S., M.W.S., Author of '*British Ornithology*,' '*British Forest Trees*,' &c.

REV. EDWIN SIDNEY, M.A., Author of '*Blights of the Wheat and their Remedies*,' and '*Electricity, its Phenomena, Laws*, &c.'

WILLIAM SPENCE, F.R.S. and L.S., V.P. Ent. Soc., Vice-President of the Ipswich Museum, Author of '*An Introduction to Entomology*,' &c.

WILLIAM THOMPSON, President Nat. Hist. and Phil. Soc. Belfast, Author of '*The Natural History of Ireland*,' &c.

NATHANIEL WALLICH, M.D., F.R.S.L. and E., F.L.S. and G.S., Author of '*Plantæ Asiaticæ Rariores*,' &c.

WILLIAM YARRELL, V.P.L.S. and Z.S., Vice-President of the Ipswich Museum, Author of '*History of British Birds*,' '*History of British Fishes*,' &c.

The following gentlemen have also consented to their Portraits being added to the Series:—Professor D. T. ANSTED, F.R.S.; Professor T. BELL, Sec. R.S.; W. B. CARPENTER, M.D., F.R.S.; J. CURTIS, F.L.S.; C. DARWIN, F.R.S; Professor E. FORBES, F.R.S; Professor OWEN, LL.D., F.R.S.; the Rev. Professor SEDGWICK, F.R.S.; Sir C. LYELL, F.R.S.; Sir W. J. HOOKER, F.R.S.

ENGINEERING SCHOOL CLASS-BOOKS.

In crown 8vo, 4*s.* 6*d.* bound, with 220 Diagrams engraved for the Work,

EUCLID'S ELEMENTS OF PLANE GEOMETRY;

with Explanatory Appendix and Supplementary Propositions for Exercise. Adapted for the Use of Schools, or for Self-instruction.

By W. D. COOLEY, A.B., Author of the "History of Maritime and Inland Discovery," "The Negro-land of the Arabs," &c.

"The editor has done all that could be done to make Euclid easy to beginners."—*Cambridge Chronicle.*

"Mr. Cooley seems almost to wish to contradict his own motto, that 'there is no royal road to Geometry,' for following in the steps of Playfair, he has considerably diminished both the volume of the work as well as the labour of the student. Prefixed to the Elements are some remarks on the study of mathematics, as valuable for the elegance of their style as for the correctness of their reasoning."—*Civil Engineer and Architect's Journal.*

"This is the best edition of the Elements which has yet appeared."—*Athenæum*—"which, for brevity, clearness, and discerning attention to the wants of learners, cannot be easily surpassed."—*Dublin University Magazine.*

"Will be found of considerable value as an aid to teachers of the Mathematics."—*New Monthly Magazine.*

Uniform with the 'Elements,' price 3*s.* 6*d.*

COOLEY'S GEOMETRICAL PROPOSITIONS

DEMONSTRATED; or, a Supplement to Euclid: being a KEY to the Exercises appended to the 'Elements,' for the use of Teachers and private Students. Upwards of 120 Propositions deduced from the First Six Books of Euclid, are illustrated in it by new Diagrams.

WHITTAKER and Co., London.

Handsomely bound in cloth, with 92 Wood Engravings, Price 6*s.* 6*d.*,

ILLUSTRATIONS OF THE BIBLE, AND CONFIRMATIONS OF SACRED HISTORY,

from the Monuments of Egypt. By W. C. TAYLOR, LL.D.

From the British Magazine.—"This is an elegant and well executed little book, on a most interesting subject."

From the Birmingham Herald—"A valuable and indispensable accession to the library of every Biblical student."

From the Rev. Thomas Hartwell Horne's Introduction to the Critical Study of the Scriptures.—"Nearly 300 texts of Scripture are more or less explained in this elegantly-executed volume, and in a manner equally curious and interesting."

Price 5*s.* 6*d.*, cloth,

THE HISTORY OF THE UNITED STATES OF AMERICA.

By JOHN FROST, of Philadelphia.

Price 7*s.* 6*d.*, cloth,

THE HISTORY OF FRANCE,

from the Earliest Period. By EMILE DE BONNECHOSE. The two volumes of the French edition comprised in the one of the translation. This work is the history approved of by the Minister of Public Education in France, where it has already passed through five editions. London: D. BOGUE, 86, Fleet-street.

NEW EDITION OF

PROF. LINDLEY'S INTRODUCTION TO BOTANY.

Recently published, in 2 vols. 8vo, with Six Copper-plates and numerous Wood Engravings, price 24*s.* cloth,

INTRODUCTION TO BOTANY.

By Professor LINDLEY, Ph.D. F.R.S. Professor of Botany in University College, London, &c. Fourth Edition, with Corrections and numerous Additions.

EXTRACT FROM PREFACE.

In this new and enlarged Edition, the Author has followed very nearly the method recommended by the celebrated Professor De Candolle, than whom no man is entitled to more deference, whether we consider the soundness of his judgment in all that relates to order and arrangement, or the great experience which a long and most successful career of public instruction has necessarily given him.

The Author has begun with what is called ORGANOGRAPHY (Book I.); or an explanation of the exact structut of plants; a branch of the subject comprehending what relates either to the various forms of tissue of which vegetables are constructed or to the external appearance their elementary organs assume in a state of combination. It is exceedingly desirable that these topics should be well understood, because they form the basis of all other parts of the science. In physiology, every function is executed through the agency of the organs: systematic arrangements depend upon characters arising out of their consideration; and descriptive Botany can have no logical precision until the principles of Organography are exactly settled. A difference of opinion exists among the most distinguished botanists, upon some points connected with this subject, so that it has been found expedient to enter occasionally into much detail, for the purpose of satisfying the student of the accuracy of the facts and reasonings upon which he is expected to rely.

To this succeeds VEGETABLE PHYSIOLOGY (Book II.); or the history of the vital phenomena that have been observed both in plants in general, and in particular species, and also in each of their organs taken separately. It is that part of the science which has the most direct bearing upon practical objects. Its laws, however, are either unintelligible, or susceptible of no exact appreciation, without a previous acquaintance with the more important details of Organography. Much of the subject is at present involved in doubt, and the accuracy of some of the conclusions of physiologists is inferred rather than demonstrated; so that it has been found essential that the grounds of the more popularly received opinions, whether admitted as true or rejected as erroneous, should be given at length.

Next follows GLOSSOLOGY (Book III.); or, as it was formerly called, TERMINOLOGY; restricted to the definition of the adjective terms, which are either used exclusively in Botany, or which are employed in that science in some particular and unusual sense. The key to this book, as also to the substantive terms explained in Organography, will be found in a copious Index at the end of the volume.

It has been the Author's wish to bring every subject that he has introduced down, as nearly as possible, to the state in which it is found at the present day. In doing so, he has added so very considerable a quantity of new matter, especially in what relates to Vegetable Anatomy and Physiology, that the present Edition may be considered, in those respects, a new work.

London: LONGMAN, BROWN, GREEN, and LONGMANS.

SECOND EDITION, REVISED AND ENLARGED,

Price 4*s.* 6*d.* Cloth,

RURAL CHEMISTRY.

By EDWARD SOLLY, Esq., F.R.S., F.L.S., F.G.S.; HON. MEMB. ROY. AGR. SOC. ENG.; Professor of Chemistry to the Horticultural Society of London; Lecturer on Chemistry in the Hon. E. I. Co.'s Military Seminary at Addiscombe, &c.

Parties not in communication with a bookseller, may have the work sent, free by post, for 4*s.* 6*d.*, on remitting a post-office order to that amount to the Publisher, JAMES MATTHEWS, at the office of the *Gardeners' Chronicle.*

SECOND EDITION REVISED, AND ENLARGED,

Price 5*s.* 6*d.*, cloth,

ORNAMENTAL AND DOMESTIC POULTRY;

their History and Management. By the Rev. EDMUND SAUL DIXON, M.A., Rector of Intwood with Keswick.

The Birds treated of are

Domestic Fowl in general	The Musk Duck	The Golden and Silver Hamburgh Fowls
The Guinea Fowl	The Grey China Goose	The Cuckoo Fowl
The Spanish Fowl	The White Fronted or Laughing Goose	The Blue Dun Fowl
The Speckled Dorkings	The Wigeon	The Lark-crested Fowl
The Cochin-China Fowl	The Teal and its congeners	The Poland Fowl
The Malay Fowl	The White China Goose	Bantam Fowls
The Pheasant Malay Fowl	The Tame Duck	The Rumpless Fowl
The Game Fowl	The Domestic Goose	The Silky and Negro Fowls
The Mute Swan	The Bernicle Goose	The Frizzled or Friesland Fowls
The Canada Goose	The Brent Goose	
The Egyptian, or Cape Goose	The Turkey	
	The Pea Fowl	

Price 3*s.* 6*d.* (post free.)

THE TREE ROSE.—Practical Instructions for its Formation and Culture.

Illustrated by 24 Woodcuts, Reprinted from the GARDENERS' CHRONICLE, with additions.

CONTENTS.

Annual pruning	Planting out, arrangement of trees, &c.	distance, shortening heads, &c. saw proper for the purpose
time, principle of execution, &c.	Pushing eye, spring treatment of dwarf shoots from	GRAFTING.
Binding up	Roses, different sorts on the same stock	Aphides, to keep down
Budding knife	Roses, short list of desirable sorts for budding with a pushing eye	Free-growers, remarks on
Budding, time of year, day, time of day, state of the plant, care of buds	Sap-bud, treatment of	Graft, binding up and finishing
Budding upon body	Shape of trees	Grafting, advantage of
Bud, insertion of, into stock	Shoots and buds, choice of	Grafting, disadvantage of
Bud, preparation of, for use	Shoots for budding upon, and their arrangement	Operation in different months
Buds, dormant and pushing	Shoots, keeping even, and removing thorns	Preliminary observations
Buds, failing	Shortening wild shoots	Roses, catalogue and brief description of a few sorts
Buds, securing a supply of	Stocks, planting out for budding upon; the means of procuring; colour, age, height; sorts for different species of Rose; taking up, trimming roots, sending	Scion, preparation and insertion of
Caterpillars, slugs, and snails, to destroy		Scion, choice and arrangement of
Causes of success		Stock, preparation of
Dormant buds, theory of replanting with explained		APPENDIX.
Guards against		A selection of varieties
Labelling [wind		Comparison between building and grafting
Loosing ligatures		
March pruning		
Mixture for healing wounds		
Pruning for transplantation		

Price 3*d.*, or 5*s.* for 25 copies for distribution amongst Cottage Tenantry, delivered anywhere in London, on a Post-office order being sent to the Publisher, JAMES MATTHEWS, at the Office of the *Gardeners' Chronicle.*

GRAY, ORMSON, AND BROWN,

DANVERS STREET, CHELSEA,

Respectfully solicit the attention of the Nobility and Gentry to their superior manner of Erecting and Heating every description of Building connected with Horticulture. They have much pleasure in giving the following testimonial referring to the range of houses shown below.

Peach House, 30 by 16 feet. | Vinery, 30 by 16 feet. | Stove, 45 by 20 ft. | Greenhouse, 45 by 20 ft. | Vinery, 30 by 16 ft. | Vinery, 30 by 16 ft.

[Erected for John Shaw Leigh, Esq., Luton Hoo.]

Extract of a Letter from Mr. Fraser.—"I have much pleasure in expressing my entire satisfaction with the range of houses you erected here. I may also state that my honoured employer, John Shaw Leigh, Esq., is perfectly satisfied. I have no hesitation in stating, that to the best of my knowledge, there is not a more complete range of glass in the country, as regards both building and heating. I may add that they are admired by every Gardener who has seen them. I shall have much pleasure in answering any references you may please to direct.

(Signed.) "James Fraser, Gardener, Luton Hoo Park."

BRENTFORD.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, MARKET-GARDENERS, AND PUBLIC COMPANIES, ENGAGED IN PLANTING.

MESSRS. PROTHEROE and MORRIS are favoured with instructions to submit to an unreserved Sale, by Auction, on the premises, Brentford Nursery, Middlesex, about the second week in October (by order of the executors of the late Mr. J. Ronalds), the whole of the valuable NURSERY STOCK, riding over about 30 acres, consisting of a large and rich assortment of Standard and Dwarf Maiden, Trained and Untrained Fruit trees, of every description; Ornamental trees, Deciduous and American Shrubs; fine Evergreens, &c. Further particulars in future advertisements.

American Nursery, Leytonstone, July, 1850.

DALSTON NURSERY.

GREAT SALE OF GREENHOUSES, PITS, &c.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, BUILDERS, AND OTHERS.

MESSRS. PROTHEROE and MORRIS are instructed, by Mr. J. Smith, to submit to pubic competition by Auction, on the premises, Dalston Nursery, Middlesex, on MONDAY, September 2, at 12 o'clock (in consequence of the premises being required by the London and Birmingham West India Dock Junction Railway Company), the erection of 14 Greenhouses, several Pits, and one, two, and three-light Boxes, the greater portion of which are glazed with green glass; also a considerable quantity of Bricks, Paving Stones, Hot-water Pipe, Furnaces, &c. May be viewed prior to the sale. Catalogues may be had (1*s.* each, returnable to purchasers) of the principal Seedsmen in London, on the Premises, and of the Auctioneers, American Nursery, Leytonstone, Essex.

N.B. The whole of the choice Greenhouse Plants (including the Camellias, ranging from 18 inches to 10 feet, beautifully set with bloom buds) will be sold by Auction the latter part of September.

HAMMERSMITH.

TO GENTLEMEN, NURSERYMEN, AMATEURS, & Others.

MESSRS. PROTHEROE and MORRIS will submit to public competition by Auction, on the premises, Swiss Cottage, Hammersmith, on TUESDAY, 13th August, at 1 o'clock (by order of the executors of the late J. W. Appleford, Esq), the whole of the GREENHOUSE PLANTS, comprising choice Cacti, Aloe, Camellia, Geraniums, Fuchsia, Nerium, and Chrysanthemums, 50 rows of choice named Tulips, fine Carnations, &c., together with two 2-light Boxes, Tulip Stage, Irons, 7 Hives of Bees, 2 Pigeon Aviaries, a Chunk Stove, 4 Crucible Vases, Water Tubs, Bricks, Paving Tiles, Miniature Pots, Garden Pans, &c.; also about 40 Fancy Pigeons, consisting of Almond Tumblers, Turbots, Dun | Black, Blue, and White Horsemen, &c.—May be viewed prior to the sale, Catalogues had (6*d.* each, returnable to purchasers) on the premises, of the principal Seedsmen, and of the Auctioneers, American Nursery, Leytonstone, Essex.

N.B. The two Greenhouses advertised last week for sale, are taken by the landlord.

FOR SALE, AT BRIGHTON, A FREEHOLD RESIDENCE, with COACH-HOUSE, STABLING, &c.; With Nine splendid Graperies in the highest state of culture and bearing, and in first-rate condition, with a Lady's Conservatory and Parterre; or the Graperies only.—This desirable Freehold Property offers a Genteel Residence to a Gentleman, or Family of quiet habits liking pleasurable occupation, or otherwise. To such as desire a Summer Climate in the Winter and Spring, it affords Walks under Glass of 30, 60, and 80 feet in length, with food for the mind, to cast off the *ennui* and monotony of sitting by the fire-side. To prudent men, desirous of the pleasures of home with the profits of an Investment, and as an antidote against expensive habits, this Property offers peculiar advantages. To such as prefer a *Non far niente* life, facilities offer for a purchaser to let off to a tenant the outer Garden and Graperies, with his own reservations of ingress and egress. The Italian Cottage Villa is well adapted for a small genteel family as it is, but is capable of much enlargement at very little cost, and contains on the attic floor two front and one back bed-room, and a dressing-room (good rooms). On the first floor, three best bed-rooms, and two dressing-rooms, and an ante-room. On the ground-floor, a good entrance, with drawing-room, and small conservatory, breakfast-room, or library, and dining-room, *en suite*. Water-closet, kitchen, scullery, larder, housekeeper's room, small butler's pantry, &c. Good cellarage for wine and beer below stairs. The outbuildings consist of coach-house, two-stalled stable, with loose-box and loft over, ceiled for rooms, for which only partitions are required for servants' rooms, the length being 52 feet. A moiety of the purchase-money may remain on mortgage, if required.—Address to H. J., 6, Richmond-terrace, Brighton.

CAPITAL FARM TO LET.

TO BE LET, and entered upon at Michaelmas, all that excellent Farm known as CLAVERTON MANOR FARM, situate close to the city of Bath, containing 320 acres. Rent 400*l.* Rates, Tithe, Rent-charge, and Taxes, unusually moderate.—Apply to J. H. Cotterell, Land-agent and Surveyor, 6, Terrace-walks, Bath.

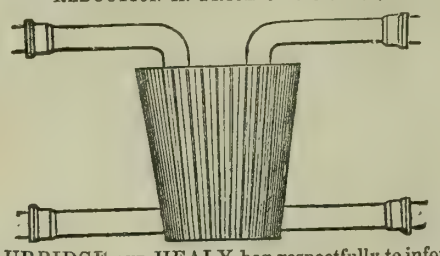
FARM TO LET.—COUNTY OF SUSSEX.

TO BE LET, at Michaelmas next, on liberal terms, the FARM OF GROVELY, Warbleton, containing 147 acres; 20 acres of Marsh Land to be let with it. Grovely is 7 miles from Battel and Robertsbridge.—Apply to Messrs. Pattenden and Smith, 247, High-street, Borough; or Mr. Joseph Parkhurst, Markly, near Heathfield, Sussex.

SUSSEX, ON THE BORDERS OF KENT.

FARM TO BE LET, with good Farm House, Buildings, &c., near the beautiful village of Hawkhurst, in Kent, and several leading market towns, consisting of 263 acres of good Land, principally Meadow; the remaining portion Arable, Hop, and Wood Land. Rent, Tithes, &c., moderate.—Apply (enclosing two postage stamps) to Mr. Hubley, Farm Agent and Valuer, 62, Nelson-square.—Also wanted, a Small Farm, from 50 to 200 acres, good houses and buildings, within 20 miles of London. Good sound land, suitable or convertible into a Nursery Ground, or for fine seeds.—Particulars to be sent to Mr. Hubley, as above.

FLORAL NOVELTY. — PANSY COMPACTUM, or DOUBLE PANSY, named and described by Mr. G. Glenny, to whom specimens were sent. From the habit and growth of this superb Pansy, with a profusion of flowers standing out upon long foot-stalks, it is rendered eminently attractive, and will doubtless form a standing ornament to the Flower Garden. N.B.—Strong plants will be sent out the first week in October, at 5*s.* each, or seven for 30*s.* Orders taken by A. Dods, Rose-hill Nursery, Brighton, who will execute them in rotation on receiving remittances from unknown correspondents.—Brighton, Aug 10.



PELARGONIUM, "FOQUETTS MAGNIFICENT."

CHARLES DIMMOCK, Florist, Ryde, Isle of Wight, having obtained a stock of the above from the raiser, will send out Plants, well-established, in 3-inch pots, in the first week of October next, at 7*s.* 6*d.* a plant, or 30*s.* for six, to the trade.

This flower has proved one of the most desirable of its class in cultivation, being a free bloomer, extraordinary trusser (some of the trusses had nine pips), very constant and strong habit, the shape, colour, size, and substance is first-rate.—Terms: cash, and priority of payment, will ensure priority of selection.

Nurseries, 113, High-street Ryde, Isle of Wight, Aug. 10.

REDUCTION IN PRICE OF BOILERS.

BURBIDGE and HEALY beg respectfully to inform their Friends, in consequence of the present reduced price of iron, they are enabled to make a considerable reduction in the price of their Boilers. The price will be, now:

16 in. do.	150 ft. 4 in. do.	... 3	10 0
18 in. do.	250 ft. 4 in. do.	... 4	10 0
21 in. do.	350 ft. 4 in. do.	... 5	10 0
24 in. do.	450 ft. 4 in. do.	... 7	0 0
	New Pattern Boilers.		
25 in. will warm	600 ft. 4 in. pipe	... 11	10 0
30 in. do.	800 ft. 4 in. do.	... 15	15 0
36 in. do.	1500 ft. 4 in. do.	... 25	0 0

All Boilers with double arms, up to 18 in., 5*s.* extra; to 24 in., 10*s.* extra; all above the same price.

130, Fleet-street, London, Aug. 10.

THIRD SEPTENNIAL BONUS.

CROWN LIFE ASSURANCE COMPANY, 33, NEW BRIDGE STREET, BLACKFRIARS, LONDON.

Directors.

George H. Hooper, Esq., Chairman.
Sir John Kirkland, Deputy-Chairman.

John Chapman, Esq.
Charles Chippindale, Esq.
Jas. Colquhoun, Esq., L.L.D.
B. D. Colvin, Esq.
Rear Admiral Dundas, C.B., M.P.
George Hankey, Esq.
Thomas Harrison, Esq.
Jameson Hunter, Esq.
John Nelson, Esq.
Octavius Ommanney, Esq.
Alexander Stewart, Esq.
William Whitmore, Esq.
William Wilson, Esq.

Auditors—J. C. H. Colquhoun, Esq.; J. R. Gardiner, Esq.; and W. H. Göschen, Esq.

Physician—Sir C. F. Forbes, M.D., K.C.H., 23, Argyll-street.
Surgeon—John Simon, Esq., F.R.S., 3, Lancaster-place, Strand.
Standing Counsel—Charles Ellis, Esq.
Solicitors—Messrs. Hale, Boys, and Austen.
Bankers—Bank of England. Actuary—J. M. Rainbow, Esq.

On a THIRD SEPTENNIAL INVESTIGATION into the affairs of this Company, to the 25th March, 1846, a Bonus, amounting on the average to 31 per cent. on the Premiums paid for the preceding Seven Years, was assigned to all Policies of at least Three Years' standing, and effected for the whole duration of life.

To similar Policies the following Bonuses were declared at former Divisions, viz.:—

FIRST DIVISION, IN 1832.

On the average, upwards of 26 p. cent. on the Premiums paid.

SECOND DIVISION, IN 1839.

On the average, 33 per cent. on the Premiums paid for the preceding Seven Years.

THE ADVANTAGES OF THIS OFFICE, among others, are:—

1. A participation septennially in two-thirds of the profits, which may be applied either in reduction of the Premium, or to augment the sum assured.

2. Premiums may be paid in a limited number of annual sums instead of by annual payments for the whole of life; the Policy continuing to participate in profits after the payment of such Premiums has ceased.

3. The Assurance or Premium Fund is not subject to any charge for Interest to Proprietors.

4. Permission to pass to Continental Ports between Brest and the Elbe inclusive.

5. Parties (including Officers of the Army, Navy, East India Company, and Merchant Service,) may be assured to reside in or proceed to all parts of the World, at Premiums calculated on real data.

6. Claims to be paid within three months.

7. The Assured may dispose of their Policies to the Company.

8. No charge but for Policy Stamps.

The Prospectus, Tables of Rates, &c. to be had at the Office in London, or of the Company's Agents.

T. G. Conyers, Secretary.

CHOICE CALCEOLARIA, PANSY SEED, &c.

JAMES CHARTRES, Seedsman, 74, King William-street, City, London, has to offer a quantity of each of the above much esteemed Flower Seeds, saved by the first growers of the day, and which he can confidently recommend, each per packet, 2*s.* 6*d.* and 5*s.*—August 10.

THE GREAT WEST OF ENGLAND DAHLIA EXHIBITION, Open to all England, will be held at Wilton Park, Salisbury, on Wednesday, the 28th of August next. Full particulars may be had on application to

Aug. 17. JOHN KEYNES, Hon. Sec., Salisbury.

DAHLIAS.—At the next Show of the NEWBURY HORTICULTURAL SOCIETY, to be held in the grounds adjoining the Railway Station, on Friday, Sept. 6, 1850, the following Prizes will be competed for, open to all England.

THE GIFT OF THE SOCIETY, for 24 dissimilar blooms, 3 Prizes, best 5*l*, 2d 3*l*., 3d 2*l*.

THE GIFT OF MR. C. TURNER, Royal Nursery, Slough, for 6 dissimilar blooms, from varieties sent out by him at any time, 2 Prizes, 1st 2*l*., 2d 1*l*.

THE GIFT OF MR. J. KEYNES, Florist, Salisbury, for 6 dissimilar blooms, from new varieties sent out by him this season; 3 Prizes, 1st 1*l*., 2d 15*s*., 3d 10*s*.

No Entrance Fee. Exhibitors to provide their own stands. Flowers to be ready for the Judges by half-past 10 precisely. Persons intending to compete must give notice to Mr. F. S. Adnams, Northbrook-street, Newbury, on or before Tuesday, Sept. 3d. Certificates will be given for Seedlings.

This Advertisement will not be repeated.

F. S. ADNAMS, G. H. BECKHUSON, Honorary Secretaries, Newbury, Aug. 17.

TROWBRIDGE GRAND HORTICULTURAL AND FLORAL EXHIBITION (the first held in this town), under the patronage of the High Sheriff and Members of the County, open to all England, will be held on WEDNESDAY, 28th August. First prize for 24 Dahlias, 5*l*.; and other prizes equally liberal. First prize for 9 Greenhouse Plants, 5*l*.; and 50 other prizes for Plants, Fruits, &c. Money Prizes and Horticultural Design Certificates for Seedling Dahlias and New Plants will be given. Entrance Money to show in all classes, 7*s*. 6*d*.—Schedules may be obtained of Mr. J. G. FOLEY, Honorary Secretary, The Parade, Trowbridge.

EXTRA PRIZES FOR DAHLIAS.—Open to all England.

THE HALSTEAD AND NORTH ESSEX FLORAL AND HORTICULTURAL SOCIETY have determined to offer the following prizes for Dahlias, at their next Show, to be held at Halstead, Essex, on the 3d of September next, namely, For the best 12 Dissimilar Blooms, 2*l*.; second best, 1*l*.—Entrance Fee, 2*s*. 6*d*., to be paid on entering for the prizes.

Halstead, August 17. G. P. ARDEN, Hon. Sec.

ROSES. — NURSERYMEN, to whose business ROSES would be a desirable addition, may hear of a party having a large select collection of Plants, principally saleable in autumn, 1851, who wishes to negotiate for a partnership to manage that department; could also undertake the books, correspondence, &c. The western side, between Slough and London, preferred.—Address, Z. A., Post-office, Hambrook, near Bristol.

TO STRAWBERRY GROWERS.

WILLIAM HUSSEY has to offer, in fine strong plants, the under-named STRAWBERRIES, at per 100.

Black Prince	4*s*. 0*d*.	Elton Pine	2*s*. 0*d*.
British Queen	2 0	Keens' Seedling	2 0
Comte de Paris	2 6	Princess Alice Maud	2 0
Eleanor	3 6		

Fine Hambro' Vines, from eyes, very strong, 2*s*. 6*d*. and 3*s*. 6*d*. Horticultural Gardens, Norwich, Aug. 17.

RENÉ LANGELIER, of the Clarendon Nursery, St. Helier, Jersey, takes the liberty of informing Amateurs of PEARS that his very extensive collection is now in full bearing, and embraces the present opportunity of soliciting their inspection of the different sorts now on the trees; many of the summer kind may be tasted. Communication from all parts of England daily, viâ London, Brighton, Southampton, Weymouth, Torquay, and Plymouth. R. L. is confident that amateurs of Pears will be gratified by an inspection.

CALCEOLARIA SEED.

JOHN CATTELL has now ready to send out, in packets at 2*s*. 6*d*. each, Seed of the above, of the present year's saving, from a collection of first-rate sorts, carefully impregnated, and warranted to give a good variety of sorts fitting to adorn the Greenhouse or Conservatory. Directions for the culture of the same will be sent with each packet.

Also GERANIUM SEEDS, saved from Florist's and Fancy varieties, separate, of the new kinds, as sent out last year, 2*s* 6*d*. per packet; each packet will contain 18 seeds, or they may be had half of each for the same price, at the purchaser's option. The present is a good time for sowing all the above.

Remittances to accompany orders from unknown correspondents. Bulbs of Tropæolum brachycerus and Tricolorum grandiflorum, worth the attention of the trade.

Westerham, Kent, Aug. 17.

ANTHONY'S PATENT AMERICAN CHURN.—The Silver Medal was awarded to this implement at the Royal Agricultural Society's Show at Exeter, 1850, Stand No. 25. Ten prizes have also been awarded by the judges of the Highland Society's Cattle Show, held at Glasgow on the 1st, 2d, and 3d August, 1850.—Apply to KEY and MITCHELL, at the Depôt for Patented and other new and useful Inventions, 97, Newgate-street, London.

DICKINSON'S NEW ITALIAN RYE-GRASS SEED is now ready for delivery, price 7*s*. per bushel. No. 7, Curzon-street, May Fair, London.

TO FLORISTS AND AMATEURS.

ESTABLISHMENT FOR THE INTRODUCTION OF NEW PLANTS, LUXEMBURG.

The undersigned, Agents to the above Establishment, are prepared to receive and transmit orders for the following new plants, lately introduced by J. LINDEN, of Luxemburg, deliverable on and after the 1st of September next.

FUCHSIA VENUSTA, H. B. K.—Strong plants, 1*l*. One of the most splendid species introduced, and far superior to Fuchsia serratifolia, of a similar habit, but differing therefrom by very large flowers; calyx of a lively vermilion orange, and large extended petals of a coral red. Native of the cold regions of New Grenada. This remarkable plant carried away the first prize at all the principal shows in Belgium, and is represented in the "Flore des Serres" for December, 1849.

FUCHSIA NIGRICANS, LINDEN.—Strong plants, 8*s*. Handsome species, an abundant flowerer, with dark purple petals.

ALLOPHLECTUS CONGESTUS, DECAISNE.—Strong plants, 12*s*. See description in Catalogue, to be had as under.

BOMARIA EDULIS.—Strong plants, 12*s*. A charming climber, lance-shaped leaves, light green above, dark red, spotted with yellow. This beautiful specimen carried away a medal at the great exhibition at Ghent.

BEFARIA ÆSTUANS	...	... £1 4*s*.
,, DENSA	...	... 1 0
,, TRICOLOR	...	... 1 8

BETHAM AND BLACKITH, AGENTS FOR FLORISTS, Custom House and General Agents, Cox and Hammond's Quays, Lower Thames-street, London, Aug. 17.

PELARGONIUM, "FOQUETT'S MAGNIFICENT."

CHARLES DIMMOCK, FLORIST, Ryde, Isle of Wight, having obtained a stock of the above from the raiser, will send out Plants, well-established, in 3-inch pots, in the first week in October next, at 7*s*. 6*d*. per plant, or 30*s*. for six, to the trade.

This flower has proved one of the most desirable of its class in cultivation, being a free bloomer, extraordinary trusser (some of the trusses had nine pips), very constant, and strong habit, the shape, colour, size, and substance is first-rate.—Terms: cash, and priority of payment will ensure priority of selection.

Nurseries, 113, High-street, Ryde, Isle of Wight, Aug. 17.

TO THE ADMIRERS OF THAT SPLENDID AUTUMNAL FLOWER, THE CHRYSANTHEMUM.

YOUELL AND Co. are now prepared to execute orders from their extensive and very select collection of the above, comprising all the new and fine continental varieties, at the following prices:

50	best new sorts	25*s*.
25	ditto	15*s*.
12	ditto	9*s*.

Well established in small pots, or by post free.

NEW DWARF CHINESE OR LILLIPUTIENNE CHRYSANTHEMUMS.

This new and beautiful class are well deserving the attention of cultivators from their exceeding dwarf habit (not attaining more than 1 foot in height). The profusion of flowers with which they are covered, as well as the great variety and distinctness of colour, will render them general favourites. Strong plants for autumn blooming are now ready for sending out at the following prices:

9	fine varieties sent out last year (for the first time) for	9*s*. 0*d*.
13	do. raised by M. Lebois (and sent out for the first time this season), for	30 0

One sent over to the Trade when two are ordered.

The latter are figured in the last December Number of the "Annales de la Societé d'Agriculture et de Botanique de Gand," and are perfect gems, engravings of which may be seen at YOUELL and Co.'s Nursery.

Descriptive Catalogues of the above may be had on application. Printed directions of their successful and easy method of cultivating the Chrysanthemums for exhibition, &c., will be forwarded with all orders.

ANEMONE SEED,

Saved from selected sorts, is now being harvested by YOUELL and Co. in the finest condition, and can be forwarded, per post free, at 2*s*. 6*d*. and 5*s*. per packet, sufficient to sow a bed of 12 and 24 yards. If sown at the present time it will afford a fine display through the autumn and winter months.

Royal Nursery, Great Yarmouth.

KITLEY'S GOLIAH STRAWBERRY. — The merits of this Strawberry are now so well known, as being hardy, large, fine in colour, a most excellent flavour, and forces well, that all parties who have seen it growing, or tasted the fruit, have expressed their entire satisfaction with it. This is the fifth season it has fruited in the same bed, and the plants are now perfectly healthy, and likely to continue much longer in bearing; the fruit this season have been as large and more abundant than from younger plants.

From the *Gardeners' Chronicle*.—"STRAWBERRIES: *J K*. Your Seedling Strawberry, Goliah, judging from its size and appearence, is worthy of cultivation."

From the *Gardeners' and Farmer's Journal*.—"STRAWBERRIES. *J. K., Lyncombe Vale*.—We have great pleasure in bearing testimony to the exquisite flavour of your Seedling Strawberry, 'Goliah.' In our opinion, it combines the piquant flavour of the Strawberry with the richness of the Pine, the delicious aroma of which it partakes in equal proportion to taste. Apart from the Queen of Fruits, we certainly do not remember anything in this way that conveyed to our senses so delicious a treat as the noble fruit to be known to the world as 'KITLEY'S GOLIAH STRAWBERRY.'"

Strong well-rooted plants are now ready at 3*s*. 6*d*. per dozen, or 1*l*. per 100, on prepaid application only to JAMES KITLEY, Bath; Messrs. Low and Co., Clapton Nursery; Mr. J. G. Waite, Seedsman, 181, High Holborn, London; Messrs. Garraway, Mayes, and Co., Bristol; Messrs. Lucombe, Pince, and Co., Exeter; and Messrs. W. E. Rendle and Co., Plymouth.

Lyncombe Vale Nursery, Bath, Aug. 17.

CHRYSANTHEMUMS.

CHANDLER AND SONS, NURSERYMEN, Vauxhall, London, are now sending out fine Plants of all the best sorts of CHRYSANTHEMUMS, for autumn flowering, at 12*s*. per dozen, package included. It is requested that a Post-office order may accompany all orders from unknown correspondents.

CHOICE CALCEOLARIA SEED.

J. HENCHMAN begs to announce that his choice CALCEOLARIA SEED, saved from superb varieties, is now ready, at 2*s*. 6*d*. per packet. The attention of the trade is also invited to his stock of above 10,000 strong Seedling CEDRUS DEODARA, which he offers on very advantageous terms.—Edmonton, Middlesex, Aug. 17.

DANIEL BUTLER has purchased the Stock of SEEDLING CINERARIAS of Mr. J. Pond (a successful Amateur), of Devonshire Cottage, Bath, saved from the best sorts in cultivation with great care; all Show Flowers, viz., Madam Cerito, Sir Charles Napier, Bridesmaid, Lilac Perfection, Climax, Blue Beard, Dazel Rosea, Fairy, Lord Gough, Queen of May, and Beauty of Newington. The plants will be all had from Devonshire Cottage by D. B. as they are sent out, all true from the sorts named above. This will present an opportunity of possessing a first-rate collection at a very low price, viz., 4*s*. per doz. A deduction where a large quantity is taken.

N.B. A remittance expected from unknown correspondents.

Widcombe Nursery, Bath, Aug 17.

NEW PLANTS AT REDUCED PRICES.—A List of GERANIUMS, FUCHSIAS, VERBENAS, PETUNIAS, CHRYSANTHEMUMS, and other Plants, at very reduced prices, is now ready, and will be sent on application, prepaid. The following selections now sending out.

FUCHSIAS.—Story's, Mayle's, Smith's, and Rumley's, new varieties of 1850, 12 for 20*s*.; or 20 for 30*s*.

60	very fine varieties, including the above	...	£2 0 0
40	ditto ditto ditto	...	1 10 0
25	ditto 17*s*. 6*d*. 12 superb varieties	...	0 9 0

All well established in 48-size pots.

Catalogues sent pre-paid on receipt of four postage stamps. Goods delivered free to London.

BASS and BROWN, Seed and Horticultural Establishment, Sudbury, Suffolk.

NEW SEEDLING STRAWBERRY—MYATT'S "SURPRISE."—This is a variety raised from the British Queen, which it resembles, though of a more robust habit, and a very free bearer, producing a greater abundance of those large angular-shaped Strawberries than any other variety, and finishing off the last fruit of a good size, price 50*s*. per 100.

Strong plants are now ready, price 50*s*. per 100. Also Myatt's Eleanor, 5*s*. British Queen, Globe, Mammoth, Comte de Paris, Hooper's Seedling, Keens' Seedling, Swanston's Seedling, Elton Pine, 3*s*. 6*d*. Fertilised Hautbois, 5*s*. Cuthill's Black Prince, 10*s*. 6*d*. per 100.—Manor Farm, Deptford.

ROBERT HALL, FLORIST, Alkrington, Middleton, near Manchester, Lancashire, begs to call the attention of Gentlemen, Amateurs, and Florists, to his choice Collection of AURICULAS, ALPINES, POLYANTHUSES, PRIMROSES, CARNATIONS, PICOTEES, and PINKS, Catalogues of which may be had on application, enclosing a postage stamp.

LANCASHIRE SHOW GOOSEBERRIES.—R. H. feels much pleasure in reminding those gentlemen who have hitherto favoured him with their orders, that his plants are this season in their usual fine, strong, and healthy condition.

Alkrington, Aug. 17.

THOM'S SEEDLING STRAWBERRY.

ROBERT THOM, MARKET GARDENER, Cornhill Gardens, Aberdeen, is now ready to supply Plants of the above Strawberry at 1*l*. 1*s*. per 100; 25 plants, sent post free, 7*s*. 6*d*. Usual discount to the trade.

"We have seen the beds of THOM'S Seedling now in fruit at Cornhill Gardens, and have no hesitation in saying that they entirely surpass anything of the kind we have ever seen in the course of a not very limited experience, and our opinion has been more than confirmed by the eulogiums of more competent judges."—*Aberdeen Herald*

"THOM'S Seedling.—These favourite Strawberries are now to be seen in great perfection at Cornhill Gardens, in the opinion of skilful horticulturists and judges they are now established as one of the most prolific varieties, and are of rare flavour, large size, and handsome shape. Our unbiassed verdict is, that they are worthy of all praise."—*Aberdeen Journal*.

ROBERT THOM wisely proved his Seedling by a large and varied experience before announcing it for sale, and it is now admitted by all who have tried the plant that it is decidedly one of the most prolific, the most hardy, and the most delicious in point of flavour of any Strawberry that has yet appeared in the north."—*Aberdeen Gazette*.

Agents: Messrs. Hurst and M'Mullen, Seedsmen, Leadenhall-street, London; Mr. John Scott, Seedsman, Chester road, Manchester; and Mr. John M'Lane, Florist, Camera-square, Chelsea.—Orders addressed to R. THOM, Cornhill, Aberdeen, will be punctually attended to.

Cornhill Gardens, Aberdeen, August 17, 1850.

GRAPE VINES IN POTS FOR FORCING.

J. WEEKS AND CO., King's-road, Chelsea, beg to call attention to their splendid collection of Grape Vines, all struck from eyes, now two and three years old, the finest Plants that have ever been offered for Sale, consisting of 60 varieties, all of the best sorts, warranted true.

THE HAMBURGHS AND MUSCADINES being the best for early forcing in pots, this is the best time for Gardeners to have them, so as to get the eyes ripe and prominent. This Nursery is well worthy of a visit, as all modern Horticultural improvements are in full operation.

J. WEEKS and Co., King's-road, Chelsea.

MITCHELL'S MINERAL BLACK PAINT.—This antiseptic Paint is intended for Park Fencing, and for all farming purposes; it is particularly adapted, by its prevention of dry rot in timber and repellance of damp, for Barns, Stables, Outhouses, Weather Boarding, Hop-poles; also for Carts, Waggons, &c., particularly the Wheels, and for Iron Hurdles, Iron Railings, and all Wood or Iron Work in exposed situations. For Brick Walls it is highly serviceable as a preventive of damp, and also for Walls intended for Fruit Trees, as, besides preserving the Wall, it increases the heat in all situations exposed to the sun, and prevents the harbouring of insects. It is also an excellent covering for Canvas, or Cart Tilts, Roofing, &c. Sold in casks containing from 1 cwt. to any quantity, at 17*s.* 6*d.* per cwt., quite ready for use, by

JAMES PHILLIPS and Co. (the sole agents), 116, Bishopsgate-street, Without, London.

Also, Glass Rulers, Glass Inks for office-stands, desks, &c. Stationers and Schools supplied. Wholesale Warehouse for Ornamental Shades, Lamp Shades, Gas Glasses, Genuine White Lead, Paints, Colours, and Pumps for Farm purposes.

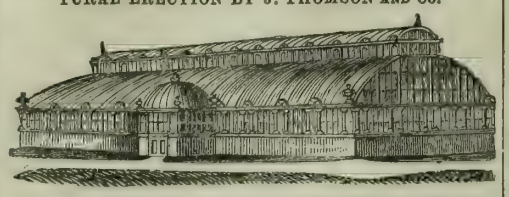
Our Catalogue of 18 folios is the most complete ever published. No Gardener or Farm Bailiff should be without one. May be had Gratis on sending two postage stamps to Messrs. COGAN and Co., 48, Leicester-square, London.

THE HIPPOPOTAMUS presented by H. H. the Viceroy of Egypt to the Zoological Society of London, is exhibited daily from One to Six o'clock, at their Gardens in the Regent's Park. The Band of the First Life Guards will perform, by permission of Colonel Hall, every Saturday, at Four o'clock. Admission One Shilling, on Mondays Sixpence.

BURBIDGE AND HEALY'S COOKING APPARATUS, combining Sylvester's Patents.—This cooking apparatus possesses greater general advantages than any yet submitted to the public, both as regards strength of material and workmanship; in fact, the laws of heat are so applied as to produce the greatest effect with the least consumption of fuel, without destruction to the apparatus. B. and H. can safely recommend it, from experience, as unquestionably superior to anything of the kind hitherto made. May be seen in daily use at the Craven Hotel, Craven-street, Strand; Stevens' Hotel, Bond-street; Greenwich Hospital; University College Hospital; and is in use by upwards of 200 private families, and at the Manufactory, 130, Fleet-street, London. A prospectus can be forwarded upon application, detailing particulars and price.

IMPORTANT TO GARDENERS, &c.

R. RESTELL'S METALLIC FLEXIBLE GARDEN PEGS, PROPS, AND HOLDERS, will effect great saving in the Gardener's time, and last for years, giving an appearance of neatness and uniformity, and from their composition will not cause the slightest injury to the most delicate plants. Price 2*s.* per lb. The number varying according to weight. In the first 10 sizes, from 150 to the lb. Warranted not to corrode.—To be had of the principal Seedsmen and dealers in Horticultural Implements; and, wholesale, at the Manufactory of the Patent Metallic Ornamental Labels, 35, High-street, Croydon, Surrey.



(ADVERTISEMENT.)—London, 34, Eastcheap, 8th August, 1850. Sir,—My attention has been directed to your new method of cultivating Strawberries, set forth in the *Gardeners' Chronicle* of the 3d inst., the merits of which remain to be proved. Of this I do not complain; but I have great reason to state that you have no right to comment on my method of culture in the manner you have done, by the indirect insinuations therein made use of, which would lead many persons to suppose my method was expensive, the plan ugly, and that vermin were harboured by it; the very reverse being the case, which I am prepared to prove, from the number of testimonials I have received from those who have tried my plan. I can show my method is cheaper, will produce a greater quantity of clean fruit on an equal surface of soil, and be much more ornamental than any plan you can suggest, even with your favourite *burrs* (provided my directions are carried out as given in my pamphlet), and I consider you should show your plan to be equal to mine at least, prior to finding any fault with it, or making the indirect allusions you have done. The only conclusions which my friends have formed for your motives in writing as you have done is, that yourself or some of your friends have a large stock of *burrs* to dispose of, and seek this means to effect that end.

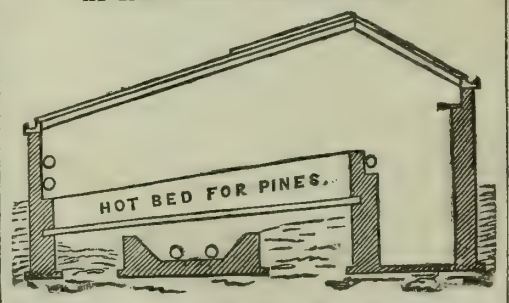
I rely on your sense of justice to me that you will insert this letter in your next Paper, and am,

Sir, Your Obedient Servant,

JOHN ROBERTS.

DESIGNS FOR EVERY DESCRIPTION OF HORTICULTURAL ERECTION BY J. THOMSON AND Co.

EVERY KIND OF HORTICULTURAL STRUCTURE Designed, Erected, and Heated by Hot Water, common Flues and other modes, on the most economical and improved modern principles. Testimonials and references from Noblemen and Gentlemen who have kindly patronised, for more than 15 years past, J. THOMSON AND Co.'s modern and simple mode of Constructing, Building, Warming, and Ventilating Garden Structures.



J. THOMSON having had full 25 years' experience as a practical Horticulturist, Landscape Gardener, and Garden Architect, in her Majesty's Royal Gardens at Windsor, Kew, and other places, most respectfully solicits the favours and patronage of Noblemen and Gentlemen about to form new, or to alter and embellish their present Parks, Gardens, &c.

Plans and Estimates for remodelling Parks and Gardens, or for Building and Heating Hothouses, and other Garden improvements, furnished on application to J. THOMSON and Co., Hothouse Builders, &c., King-st., Hammersmith, near London.

*** Melon and Cucumber Boxes and Lights, Rustic Summerhouses, Chairs, Vases, and similar Garden Ornaments made on the shortest notice.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

WARRANTED BEST MATERIALS AND WORKMANSHIP AT THE LOWEST POSSIBLE PRICES.

J. WEEKS AND CO., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road, Chelsea, London.

ONE HUNDRED AND FIFTY Gallons per day of the Purest Water can be obtained with BIRD'S HYDROSTATIC SYPHON WATER PURIFIER, for purifying rain, river, tank, pond, or pump Water. This Scientific Instrument is only 4 inches in diameter, and 7 inches high; it is dropped into the vessel containing the water, and the pipe hung down outside, as indicated in the annexed drawing. It requires no fixing, and is set in action in two minutes.

Invented, made, and sold, by ALFRED BIRD, Experimental Chemist, Birmingham; and sold by all chemists and ironmongers in the kingdom; also sold wholesale and retail at Deane's, Ironmongers, London-bridge, London. Retail price 25*s* each. Orders, containing a remittance, sent to any part of the kingdom. Packing-case 1*s.* extra.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

F. M'NEILL AND Co., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of THE ASPHALTED FELT FOR ROOFING Houses, Farm Buildings, Shedding, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained TWO SILVER MEDA PRIZES, and is the Felt SOLELY patronised and adopted by

HER MAJESTY'S WOODS AND FORESTS,
HONOURABLE BOARD OF ORDNANCE,
HONOURABLE EAST INDIA COMPANY,
HONOURABLE COMMISSIONERS OF CUSTOMS,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANIC GARDENS, REGENT'S PARK,

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the ROYAL AGRICULTURAL SOCIETY'S HOUSE, Hanover-square.

It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

PRICE ONE PENNY PER SQUARE FOOT.

*** Samples, with Directions for its Use, and Testimonials of seven years' experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.

☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are

F. M'NEILL AND CO.'S

Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where roofs covered with the Felt may be seen.

The new Vice-Chancellor's Courts, at the entrance to Westminster Hall, were roofed with F. M'NEILL and Co.'s Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.

NOTE.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

METCALFE'S ALKALINE TOOTH-POWDER will be found to be the best that has yet been produced; it contains no acids, nor anything that can injure the finest enamel; it thoroughly removes the tartar and all impurities, produces that beautiful white appearance so much to be desired, and its fragrant perfume tends to sweeten and purify the breath. M. and Co., from the many years they have been celebrated as Tooth-Brush Makers, have had opportunities (that occur to few) of testing the relative merits of those powders that have been brought before the public. They have now succeeded in procuring the receipt from which the above Powder is prepared, and confidently recommend its universal adoption. Wholesale and retail at METCALFE, BINGLEY, and Co.'s, Brush-Makers to H.R.H. Prince Albert, 2*s.* per box. Caution.—The genuine Powder will have the Royal Arms, combined with those of H.R.H. Prince Albert, on the lid of the box, and the signature and address of the firm, thus: "METCALFE, BINGLEY, and Co., 130 B, Oxford-street, London."

ALLSOPP'S EAST INDIA PALE AND OTHER BURTON ALES.—In consequence of a very inferior article being now too frequently sold under the name of these favourite Ales, the public are respectfully requested to apply at the respective stores, where a list of bottlers will be furnished, from whom these ales may be obtained genuine, and where also they may be had in casks of 18 gallons and upwards, either singly or in any quantity. Apply to Messrs. SAMUEL ALLSOPP and SONS, The Brewery, Burton-on-Trent, or their Stores, at 61, King William-street, City; Cork-street, Liverpool; High-street, Birmingham; and the Exchange, Manchester.

TOOTHACHE PERMANENTLY CURED by using BRANDE'S ENAMEL for filling decaying Teeth, and rendering them sound and painless. Price 1*s.* Enough for several Teeth. The only substance approved by the medical faculty, as being unattended with pain or danger, and the good effects of which are permanent.

Sold by all Chemists in the United Kingdom. Twenty really authorised Testimonials accompany each box, with full directions for use. Sent free, by return for post, by J. WILLIS, 24, EAST TEMPLE CHAMBERS, WHITEFRIARS, FLEET-STREET, LONDON, in return for 13 penny stamps.

CAUTION.—The great success of this preparation has induced numerous unskilful persons to produce spurious imitations, and to Copy BRANDE'S ENAMEL Advertisements. It is needful, therefore, to guard against such impositions, by seeing that the name of JOHN WILLIS accompanies each packet.

INTERESTING FACT.—The following singular and authentic case of restoration of the human hair is worthy of observation, more particularly as it relates to an article of high and universal repute during the last half century. "Mr. A. Hermann, of Queen-street, Soho, had been quite bald for some time past, and had tried various preparations for the recovery of his hair, but without any beneficial result. He was then induced to try the effects of 'Rowland's Macassar Oil,' and after daily applying it for about two months, he, much to his gratification, had his hair quite restored, and now possesses a beautiful head of hair. This fact speaks too strongly for itself to require comment."—*Bell's Weekly Messenger.*

ROWLAND'S MACASSAR OIL.—The unprecedented success of this discovery in restoring, preserving, and beautifying the Human Hair, is too well known and appreciated to need comment. For Children it is especially recommended as forming the basis of a Beautiful Head of Hair, and rendering the use of the fine-comb unnecessary. Price 3*s.* 6*d.*—7*s.*—Family Bottles (equal to 4 small), 10*s.* 6*d.*, and double that size, 21*s.* per bottle.

*** Each bottle of the genuine article has the words ROWLAND'S MACASSAR OIL engraved in two lines on the Wrapper; and on the back of the Wrapper nearly 1500 times, containing 29,028 letters.

Sold by A. ROWLAND and SONS, 20, Hatton Garden, London; and by Chemists and Perfumers.

GERMAN SPRING MATTRESSES, permanently elastic, very durable and cheap.

3 feet wide	£2	8	0	4 feet 6 inches wide	£3	3	0
3 feet 6 inches	2	13	0	5 feet	3	10	0

One of these Mattresses, with a French Mattress on it, is a most excellent and soft bed. HEAL AND SON'S List of Bedding, with full particulars of Weight, Sizes, and Prices of every description of Bedding, sent free by post.

HEAL and SON, Bedding Manufacturers, 196, opposite the Chapel, Tottenham-court-road, London.

HUGH LOW AND CO. have just published their GENERAL CATALOGUE OF PLANTS, which can be had free on application.—Clapton Nursery, London, Aug. 17.

FLORAL NOVELTY. — PANSY COMPACTUM, or DOUBLE PANSY, named and described by Mr. G. GLENNY, to whom specimens were sent. From the habit and growth of this superb Pansy, with a profusion of flowers standing out upon long foot-stalks, it is rendered eminently attractive, and will doubtless form a standing ornament to the Flower Garden. N.B.—Strong plants will be sent out the first week in October, at 5s. each, or seven for 30s. Orders taken by A. DODS, Rose-hill Nursery, Brighton, who will execute them in rotation on receiving remittances from unknown correspondents.—Brighton, Aug. 17.

CHOICE CALCEOLARIA, PANSY SEED, &c.

JAMES CHARTRES, Seedsman, 74, King William-street, City, London, has to offer a quantity of each of the above much esteemed Flower Seeds, saved by the first growers of the day, and which he can confidently recommend, each per packet, 2s. 6d. and 5s.—August 17.

MAYLE'S MODEL FUCHSIAS FOR 1850.

MESSRS. MAYLE AND CO. inform the Nobility, Gentry, and the Trade, that these seven unrivalled new reflexed Fuchsias are ready for delivery, and have proved themselves the most superb varieties ever raised. Circulars can be had upon application. See Mr. GLENNY'S opinion in the "Country Gentleman," August 5, page 491.

"HEBE is one of the pale varieties, white, with scarlet corolla, the sepals reflexing very gracefully, and forming a striking feature.

"STANDARD OF PERFECTION is scarlet, with a purple corolla. Sepals reflexing very beautifully.

"Had these come out as a pair, at the full price charged for the lot, nobody would have grumbled."

HEBE was awarded a first-class Certificate at the Birmingham and Midland Society, July 16.

105, New-street, Birmingham.

SEEDLING PELARGONIUM—"PRINCE ARTHUR."

A. PONTEY begs to announce that he will send out on Monday, the 14th October, at 1 guinea each, or four plants for 3 guineas, his seedling Pelargonium, for which the highest prize, the Silver Medal, was awarded at the Exhibition of the Royal Devon and Cornwall Horticultural Society on the 16th May; also a certificate of merit was awarded at the Devon and Exeter Exhibition, on the 24th May, and a certificate of merit at Torquay Exhibition on the 6th June.

The Splendid Pelargonium is thus described in the "Floricultural Cabinet," July:—"Upper petals large, dark clouded blotch shaded off to flesh colour, lower ones flesh colour, centre white; petals of firm substance."

Mr. Glenny's opinion of its habits and the peculiarity of its white throat, which he affirms is "purer than that of any one of the present varieties," has been given in the Country Gentleman, weekly garden newspaper.—Aug. 17.

MESSRS. STANDISH AND NOBLE'S new descriptive CATALOGUE OF SELECT HARDY ORNAMENTAL PLANTS is just published, and may be had for four postage stamps. Besides a Treatise on the cultivation of American Plants, it contains a Plate and Description of the Funebral Cypress, Notices of Cephalotaxis Fortunii, Cryptomeria japonica, Quercus sclerophylla and inversa, Viburnum plicatum and macrocephalum, with many recent introductions from the north of China, quite new to English gardens.

Messrs. S. and N. take this opportunity of stating that they give Designs for Laying out New Grounds and Plans for Improvements; also Estimates for all kinds of Planting, whether ornamental or economic.—Bagshot Nurseries, Aug. 17.

NEW LATE STRAWBERRY,
WILMOT'S "PRINCE ARTHUR."

J. WILMOT, in offering this new variety of STRAWBERRY to the Public, is confident that it combines qualities which no other kind at present in cultivation does possess, being of delicious flavour, and coming in after the principal Strawberry season is over. It possesses the property of firmness of texture, so that it may be transmitted to any part of the kingdom without sustaining injury, as it may be kept for several days after being gathered, when fully ripe, without any indication of decay or loss of flavour.

"Prince Arthur" is one of the largest sized Strawberries, and a most abundant bearer; the foliage is small, and never exceeds 6 inches in height; the fruit is consequently fully exposed to the sun. Its dwarf habit requires it to be planted not more than a foot apart. The fruit is perfectly formed, of a rich scarlet, and colouring equally all over the berry. If planted at the distance recommended it will produce double the weight per acre of any other variety.

Strong plants will be ready for sale in September next, at 5l. per 100, on prepaid application only, to JOHN WILMOT, Isleworth, Middlesex; Robert Glendinning, Chiswick Nursery; William T. Atwood, Mortlake, Surrey; George Charlwood, Seedsman, Covent-garden; and Messrs. Hurst and M'Mullen, 6, Leadenhall-street, London.—Isleworth, Middlesex, Aug. 17.

MAGNUS'S ENAMELLED SLATE is handsomer and more durable than the choicest Marbles, is less than half the cost of the commonest, and is PATRONISED by her MAJESTY and PRINCE ALBERT, the Nobility, Clergy, Architects of Eminence, Engineers, Builders, Railway Contractors, and the Public generally. It is suitable for Chimney-pieces, Pier-table tops, Vases, Ink-trays, and ornaments of various descriptions, Billiard-tables, Baths, Wash-stand, and Dressing-table Trays, Door Furniture, Candelabra, Columns, Monuments, Head Stones, Mural Tablets, Pilasters, Plinths, Fonts, Grand Staircases, Balusters, &c., and is made to represent not only the marbles in ordinary use but all the more costly descriptions, as Porphyry, Rose Granite, Broccatella, Brescia, Lapis Lazuli, Malachite, and Florentine Mosaics, and has obtained the Medal from the Society of Arts. Bored Chimney-pieces, from 25s. upwards. Price lists sent on application to Mr. MAGNUS, PIMLICO SLATE WORKS, 39 and 40, Upper Belgrave-place, London.

*** Roofing and Plain Slate work, of all descriptions, at low prices.

GREENHOUSE AND CONSERVATORY BUILDING ESTABLISHMENT, HOT-WATER APPARATUS MANUFACTORY, KENSALL-GREEN, HARROW-ROAD, LONDON.

JOHN TAYLOR begs most respectfully to call the attention of the Nobility, Gentry, and Gardeners, to the very superior manner in which he erects all kinds of Greenhouses, Conservatories, Forcing Pits, &c., and all other buildings for Horticultural purposes, combining all the most modern improvements with elegance and utility. His manner of heating Horticultural Buildings, Churches, Chapels, Public Buildings, Entrance Halls, &c., has received the greatest approbation from the Nobility and Gentry by whom he has been extensively engaged.

HOTHOUSES AND CONSERVATORIES made and fixed complete in all parts of the Kingdom, at a considerable reduction. One, two, and three-light Cucumber and Melon Boxes and Lights of all sizes, kept ready for use, packed, and sent to all parts of the Kingdom; warranted best material. Garden-lights of every description, at JAMES WATTS', Hothouse Builder, Claremont-place, Old Kent-road. Reference may be had to the Nobility, Gentry, and the Trade, in most of the counties in England.

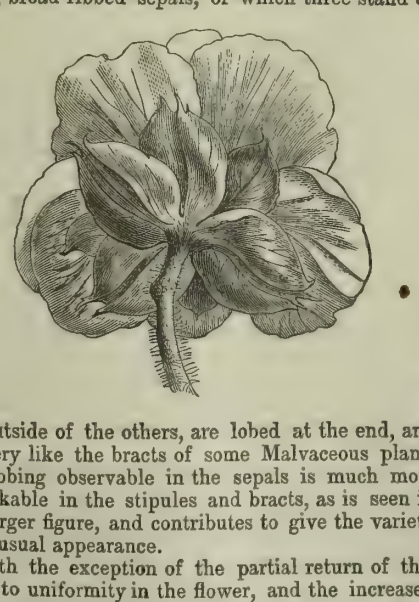
TO BRICKMAKERS.

WANTED, about 150 loads of good BURRS, fit for Garden purposes, delivered within 5 miles of Hyde-park-corner.—Apply by letter, post paid, to W. B., at the Office of this Paper.

TO MOWERS, GARDENERS, AND OTHERS.

TO LET, by private contract, the MOWING, SWEEPING, ROLLING, and EDGING of about 12 acres of KEPT GROUND, in the neighbourhood of London, partly Gravel Walks and partly Grass. The Ground must be kept in perfect order all the year round. The Contractor to find Scythes, Brooms, &c., but not a Roller. Payment to be made weekly, and the Contract to be determined by one week's notice on either side.—Apply by letter, post-paid, to A. D., care of Mr. Duncan, 10, Tokenhouse-yard, London, marked in the corner of the envelope, *Tender for Mowing*.

The Gardeners' Chronicle.
SATURDAY, AUGUST 17, 1850.



WE dare say our readers have never heard of a GERANIUM called the WILLMORE SURPRIZE, said to have been raised accidentally between a Pelargonium and a Hollyhock! If not they will find its acquaintance worth making, for it is a great curiosity, and very handsome, if employed as a bedding-out plant. The annexed cut gives as faithful a

representation of the plant as can be obtained without the colour, which is of a uniform rich crimson, not unlike that of "ROLLISSON'S Unique."

It was found by Mrs. WILLMORE, of Birmingham, growing in a bed near some Hollyhocks, and was supposed to be an accidental mule between those plants and some unknown Pelargonium—an idea that may be supposed to have arisen partly from the peculiar form of the flowers, and partly from an apparent resemblance between the calyx of the plant and the involucre of the Hollyhock.

It is in reality a semi-double Pelargonium, with the irregularity characteristic of that genus exchanged for something very like the regularity of a common Hedge Geranium. Each flower consists of from seven to nine rather convex petals, uneven at the edge, and spreading nearly equally round the common centre. There are from 15 to 17 stamens, many with perfect anthers. The stigmas, apparently also perfect, vary in number from 9 to 12. The calyx, which is very remarkable, consists of about eight hairy, broad-ribbed sepals, of which three stand on

the outside of the others, are lobed at the end, and are very like the bracts of some Malvaceous plant. The lobing observable in the sepals is much more remarkable in the stipules and bracts, as is seen in our larger figure, and contributes to give the variety an unusual appearance.

With the exception of the partial return of this plant to uniformity in the flower, and the increased number of its parts, there is, in reality, nothing to distinguish it from a true Pelargonium. Even the burrow at the base of the calyx is there. As for the stamens and pistil they appear so perfect, that the plant may be expected to seed; in which case there is a hope of the tendency to become double being increased. Should this be so, it will be a matter of high gardening interest, because we may in that case look for a race of double Geraniums, the bloom of which will be much more permanent than that of the single sorts now in cultivation for bedding out.

IT is now sufficiently evident, both from our private correspondence and public reports, that the POTATO CROP will again fail extensively, not only in Great Britain, but in Ireland. Every post brings fresh intelligence of the advance of the disease, in its old virulent form; and those who, in spite of all remonstrances, have again staked their all upon the plant must prepare to abide the consequences. We learn, however, with much satisfaction, that in the opinion of the best-informed persons in Ireland, the destruction of the crop will not be nearly so great as it was in 1845 and 1846. Early planting seems to have done its work; its beneficial effects are obvious; and it is computed that two-thirds of the whole crop, which is a very large one, will be this year saved in Ireland.

The advance of the disease has, however, already led in that country to the renewal of application for Government assistance in aid of the Practical Instructors, who were some time since appointed by Lord CLARENDON, to improve the people in the art of cultivation. It is represented that these gentlemen have proved of the greatest service in Ireland; that they constitute in themselves an admirable machinery; and that the success of their system is a matter in which all parties cordially concur. We have no doubt that these praises are well deserved, that the advice of the Instructors has proved most beneficial to those who have taken it, and that the country is still in need of all the local directions which their skill may enable them to promulgate. What we do not see is the ground upon which the United Kingdom is once more called upon to support these gentlemen. The value which they have been ascertained to possess is ill appreciated, if those who benefit by it will not pay for it. Nor do we believe that Ireland will withhold her support if she finds it to her real advantage to give *it*. We believe that country to be in a state of rapid improvement, and to be advancing fast to the condition of Great Britain herself. The middle classes, who possess money, energy, and skill, are replacing those great nominal proprietors whose misfortunes, disputes, and embarrassments have brought the country to what it is. The sale of encumbered estates is working wonders; capital is replacing poverty; resident owners and occupiers are stepping into the place of absentee landlords; and self reliance is thrusting out of the land that hopeless dependance upon Government which must of necessity be the ruin of any country. It is upon this altering and fast improving state of affairs that Practical Instructors should rely, and not upon the public funds. It may have been right to furnish the means with which to start them; but if they cannot now stand by the opinions they have won they never will so stand, and should not be supported otherwise.

Among other opinions which the present season has confirmed is the very curious and important one that diseased Potatoes may be safely and advantageously used for seed. Several cases of sound Potatoes having been obtained from rotting sets, were mentioned in our volume for 1846; instances were even mentioned where the crop thus raised was better and more abundant than where sound Potatoes had been carefully planted; and this year a similar, but more conclusive, case has occurred. Mr. BENJAMIN SMITH, of Wokingham, has produced before us proof that while disease largely exists there in fields where sound sets were employed,

there is no disease at present where diseased sets were purposely selected for trial. The following are instances:

1. Very much diseased sets of Ash-leaved Kidneys were planted on the 18th March, in drills 5 inches deep. These were taken up sound and ripe on the 2d of August *without disease.*

2. Very rotten late Potatoes were planted Nov. 1849, 6½ inches deep, covered first by 2 inches of earth, then by a layer of half decayed weeds, and lastly by earth; taken up in the beginning of August *without disease.*

3. Very bad sets planted in March, as before; taken up in the beginning of August, *without disease.* In this case each set produced about seven sound Potatoes.

4. Sound sets of Ash-leaved Kidneys and others, a mixed lot, were planted in February as before. Taken up in August, were found to be *much diseased.*

In all the neighbourhod the disease has spread much, except where the rotting sets were used.

Abraham Lewis, Blacksmith, also of Wokingham, having seen a statement concerning the value of diseased sets, published by Mr. Smith in the *Reading Mercury*, in July or August 1849, planted some land in February last with Ash-leaved Kidneys "so diseased that they appeared like dead Walnuts." His crop was dug on the 8th of August, and *proved* not only *sound*, but *abundant* and of extraordinary beauty. Some of these Potatoes, seen by us, were probably finer than any to be found in the market.

It is the opinion of Mr. Smith that diseased sets are much better for planting than sound ones. The former soon rot when the live part has begun to grow; the latter are apt to remain hard, fleshy, and brittle, even when the new crop is ripe, and he thinks that in the former case there is an effort of Nature to throw off the disease.

It is possible that the morbid matter which causes disease may disappear in the general decay of the tuber in the one case, and may remain unchanged in the other, prepared to seize upon the haulm as soon as it is ready to receive its influence. At least no better explanation of this curious fact presents itself to us at present: but the fact itself is certainly, in practice, very valuable. And we trust that our readers will take advantage of the present autumn to institute such a series of experiments with autumn planted diseased and sound Potatoes as will determine conclusively the true value of the results formerly obtained by our correspondents, and now made known by Mr. Smith.

A notice from a correspondent at Hatfield was inserted in our Paper, of the 10th of August, respecting a disease prevalent amongst Melons. We had previously received an intimation of the same, or a similar malady, from a quarter on which we could rely, and have only delayed noticing the communication from the hope of obtaining some further information, or having the opportunity of inspecting one of the diseased fruit. The letter, it should be observed, of which we make an extract, is dated July 26.

"Six weeks ago some Melons which were growing in a hot-water stove, were attacked in a peculiar manner, whole branches drooping and becoming putrid in 12 hours. One plant only being much affected, the gardener tore it up, and the affection, at least in the same form, has vanished. Three days ago, however, the same peculiar smell was perceptible in the house, and the gardener was told to be on the watch. I did not then detect any manifest symptoms of the disease except the smell. Last night, on my return from a short absence, I was told that one of the Melons was ripe, and that it had ripened very suddenly. It had then no appearance of disease, but when examined the next morning it showed symptoms like those of the leaf, and on cutting out the affected part, the whole inside of the Melon came out, giving, with its seeds, upwards of a pint of fluid, already very offensive in smell. In the interior I observed reddish brown lines, looking like the small veins in a sloughing sore, which immediately recalled the appearance of the cellular tissue of diseased Potatoes. On examination, the red lines proved to be spiral vessels, the discoloured matter being due not to the spiral vessels themselves, but to their contents. The Melons, it should be observed, were grown in *pure* loam without any dung, and they have been all along very luxuriant."

The Hatfield Melons were grown in turfy loam about 2 feet deep; and we have ourselves had Melons grown in pure sandy loam, which exhibited up to a certain point the same appearances. The plants were extremely luxuriant, and after a time single branches decayed suddenly, threatening the complete destruction of the Vines; the leaves, meanwhile, decaying in large round brown spots, which were covered on the under side with *Trichothecium roseum*. The disease made its appearance during the wet, cloudy weather at the beginning of June, and it was quite evident that during a temporary absence too much water had been supplied. When, however, the plants had been well thinned, and water entirely withheld, the decay was rapidly arrested, and the only peculiarity observed since has been the extraordinary rapidity with which the fruit ripened; a Melon of 2½ lbs. had been quite green and scentless in the morning, whereas in the evening it was yellow and evidently ripe, the day not being particularly warm, and the sun mostly obscured, with a heavy rain at noon. It was expected that the Melon would decay, but as no change took place after 36 hours it was examined and proved perfectly sound, but poor in point of flavour. It is possible that in the other cases more water was given than such luxuriant plants could bear. In our own case it is quite certain that nothing but the total abstinence system would have proved efficacious.

Some varieties are doubtless more susceptible than others. One kind alone, in our case, the old Canteloupe, suffered to any extent, in company with three others which were equally luxuriant, and in which possibly a single day might have made the difference, as the leaves of the green Cabul were already spotted. Bauhin mentions, in his history, that a netted Melon, resembling very much the Beechwood, was cultivated in his day with great difficulty, from its decaying wherever it was touched with rain.

Certain it is that the stems of most Melons are peculiarly susceptible of decay, which we have observed generally to commence from some withered leaf-stalk, and to be aided in its progress by the growth of fungi, though we believe by no means originating from them, and when the fluids of so delicate and touchy a plant have once become stagnant, there is no great cause for wonder if decay takes place during any stage of growth. A few isolated cells, in which the balance of vegetation has been disturbed, are quite sufficient to set up a rapid disease at any moment. Premature ripeness is almost always indicative of disease, and much more such rapid changes as those just noticed; and we believe that very generally where disease is set up in vegetable tissues, there is a deposit either in the cellular or vascular cavities of granular matter, like that observed so universally in diseased Potatoes, and which has been recorded in many other cases, as also in the spiral vessels of our correspondent's fruit.

HOW TO MISMANAGE A GARDEN.

Chapter II.—The noble art of mismanagement is not to be lightly acquired. It demands skill and patience, no less than good management; and although some are more celebrated for it than others, yet in all cases it will be found that it is the result of perseverance in certain fundamental principles. Such principles are not, however, always self-evident; some skilful professors of the art conceal their method so admirably that it is only by the result that their greatness becomes visible; and in this they strictly observe the precept of the first masters of antiquity, who declared that the height of art consists in concealing art.

One of the most important of these principles is never to do to-day what can possibly be put off till some other day. This may indeed seem contrary to the maxim which school-boys are taught to copy—that procrastination is the thief of time; but in the first place such rules, which are merely the expression of dull common sense, are not to be held binding upon geniuses, and in the next place this particular maxim supposes that time is valuable. It cannot be said that a thing is stolen which, because of its worthlessness or abundance, is regarded as free to all men's use. When a man stoops down to drink from a river, he cannot be said to steal the water, because it is valueless and is common property. So, in like manner, time cannot be said to be stolen, if it is worthless and cast away by its owner. Now, it is to be observed that nothing is more valueless to an accomplished mismanager than this very article of time; he has plenty of it, and to spare; it is of such small importance that it glides away before he has discovered that he possessed it; and therefore procrastination cannot be truly said to steal it.

It may be assumed, then, that putting off is a cardinal virtue in the life of a mismanager; in fact, it will have to be used as the centre stone of the triumphal arch which must one day be raised to the memory of some worthy of the class, more celebrated than any who yet have lived. It has its inconveniences, to be sure; but there is no unmixed good in this world. Mismanagers, of no small pretensions, sometimes lose places by not looking after them soon enough: some troublesome, active fellow stepping in before them. Cases have occurred of situations being forfeited, because the gardener put off having his flues cleaned till it was necessary to use them; and then they took fire. It has even been known to happen that an impatient master, not properly appreciating the value of procrastination, has suddenly dismissed his gardener for no other reason than because his crops were always sown too late. But these are horticultural martyrdoms; and the victims have the comfort and consolation of knowing that they are sufferers in a great cause.

On the other hand, consider the advantages of putting off; consider the saving of time, the pleasure of idleness, the charm of letting things alone; and above all, the chances that by not doing a thing at once it may not be necessary to do it at all. If things are done the moment they are ordered, a master has no time to reconsider his plans; and a man has no chance of escape from their execution. Thus the advantages of putting off are by no means confined to the gardener; but his master has equal profit in the system. His master indeed has especial sources of enjoyment; if he allows his grounds to be overrun with weeds, because he puts off from day to day the orders for their removal, he has at last the satisfaction of seeing two men employed where one would have been enough, and he has the still higher pleasure of recollecting that he must continue to pay two men instead of one for many a long week after. To persons of a charitable turn this is peculiarly agreeable; and upon the uncharitable, it is a visitation for which they ought to be grateful.

A great amateur used to boast that he had found the way to keep his "man" on the alert; by always deferring his orders till the time had passed to execute them well. It was true that he never had green Peas till they were hawked about the streets, that his Cucumbers generally came in in August, and that his Celery was no bigger than Asparagus; but then he had, as has been just observed, the inestimable comfort of knowing that his "man" was in perpetual waiting, and had no time to waste upon himself. So, in like manner, the descendants of Alexander Morgen, commonly called Slack Sandy, boast to this day of the sums he saved the laird of Inchquarity. The laird's garden was in a bad climate, and in sour soppy land; and when Sandy took to it he found that fruit was never borne there; so he always let alone as long as he could the pruning, and the tying, and the digging, and the nailing, and training, and draining; "for where 's the use," said Sandy, "of taking all that trouble for nothing. We never have had any fruit, and we never shall have any; and to do anything to the trees is nonsense." His arguments and his practice, between them, so convinced the laird that in due time the garden was given up, and Sandy lost his place; but it was always a comfort to him to think upon how much he had saved his master—and himself.

In short the advantages of putting off are such as hardly require illustration by argument. It is evident that no mismanagement will be perfect without it; and that the first business of those who desire to shine in so great an art will be to take every opportunity of putting it conspicuously in practice, the more especially since it is one of those qualities which are sure to be universally appreciated.

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

Twentieth Meeting, held at Edinburgh, August, 1850.—It is now 16 years ago since the Association held its meeting at Edinburgh, for the first time. A glance at the proceedings of that meeting, as compared with the present, will show what rapid advances have been made in science during the last 16 years. Nearly every department of human enquiry has its list of important discoveries to show, as indications of the rapid advances it is making; and it is to the honour of the British Association, that it may claim many of these discoveries as its own. With regard to some departments of science, this is more especially the case than with others, and we must confess that for botany it has done little or nothing. We think it is a matter for enquiry amongst botanists, and the council of the Association, to ascertain how this is. It may be that the botanists have not done their duty to the Association, or it may be that the authorities in the Association have not sufficiently consulted the wants and wishes of botanists in their arrangements. We cannot but think they are open to this charge, when we find that of 25 names upon the council, not a single botanist is to be found. We would also observe that some other departments of science are quite disproportionately represented. We think that in a scientific council, where not one botanist is found, geology is far too strongly represented for the interests of the Association, by the number eight. The meeting at Edinburgh, from all we can hear, appears to have been pre-eminently a successful one; and although the numbers were not quite so large as at Birmingham the preceding year, the receipt of money was much larger. Amongst the reports called for, and committees formed, interesting to our readers, we may mention the following. 1. A report on the history and advance of our know-

ledge of vegetable physiology, since the last report to the Association given by Dr. Lindley; from Dr. Lindley, Mr. A. Henfrey, and Dr. Lankester. 2. Committee for superintending the publication of tabular forms, in reference to the periodical phenomena of animals and plants. 3. Continuation of Committee to report on the vitality of seeds. 4. That a committee consisting of Mr. R. Hunt, Dr. G. Wilson, and Dr. Gladstone, be requested to investigate the influence of the solar radiations on chemical combinations, electrical phenomena, and the vital powers of plants growing under different atmospheric conditions. 5. That a committee be named by the Council for the purpose of waiting upon Government to request that some means be taken to insure to the sciences of natural history effective representation in the trusteeship of the British Museum. 6. Dr. H. Cleghorn, Professor Royle, Messrs. R. Baird Smith, and R. Strackey, were requested to draw up a report on the probable effects, in an economical and physical point of view, of the destruction of tropical forests. 7. That the committee on the influence of carbonic acid on the growth of Ferns, be requested to continue their investigations.

The next meeting of the Association, in 1851, is to be held at Ipswich, in Suffolk. No time was appointed, but we have heard it stated that it is likely to take place in June. In the name of natural history we must however protest against the meeting being held in this month. At this time none of the professors in the various medical schools of Edinburgh, Dublin, the Queen's Colleges in Ireland, or the metropolis, can leave their respective posts; and to all so early a season must prove a source of great inconvenience, as it has done on previous occasions when held so early in the year. Amongst the botanists present at Edinburgh we observed Dr. Greville, George Bentham, Esq., Prof. Allman, Prof. Balfour, Dr. Cleghorn, W. Gourlie, Esq., Prof. Walker-Arnott, Dr. Patrick Neill, Prof. Parlatore, Prof. E. Forbes, Prof. Dickie, Prof. Daubeny, Dr. Lankester, J. E. Winterbottom, Esq., Dr. Mackay, Joshua Clark, Esq., Dr. George Johnston, and John Ball, Esq. We shall proceed, as we have done on previous occasions, to lay before our readers a report of the proceedings in so far as they relate to the subjects of systematic botany and vegetable physiology.

VILLA AND SUBURBAN GARDENING.

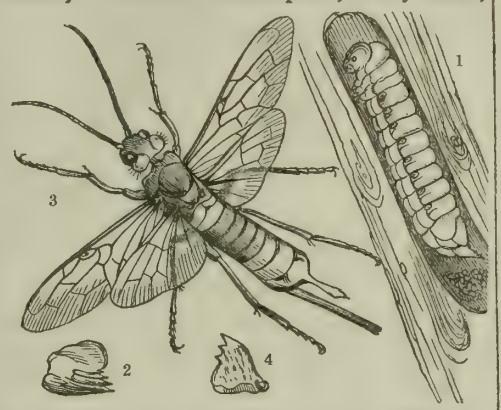
The Strawberry has long held a high position amongst what are designated small fruits. It may be eaten with impunity even by invalids—a fact which can scarcely be stated of any other fruit. Its culture for the London market constitutes an important branch of gardening, some growers possessing as many as 25 acres of Strawberries. This fruit cannot be imported with the same success as other fruits; hence the supply almost exclusively depends upon the home grower. A few hints as to the mode of culture pursued by large cultivators of Strawberries may therefore be instructive to the amateur.

The first point is to select new ground; worn out soil, and even common garden ground, is unsuitable for Strawberries. Land of rather a stiff texture, which may have been in pasture many years, well broken up and pulverised, with a good dressing of manure from the London stables, in a half decomposed state, is always considered a fair basis for profitable calculation. A market gardener never plants without thorough preparation; no expense is spared in getting everything in the best condition. It is by doing the soil justice, in the fullest sense of the word, that he can safely calculate upon a profitable return. Early autumn planting is generally preferred. The plants get perfectly established before winter, and are not liable to be thrust out of the ground by frost. The distance between the rows is from 2 feet to 2½ feet, according to the kinds, and the plants stand at from 1 foot to 1½ foot asunder in the rows. During their growth, the runners are kept constantly trimmed back, and the soil frequently stirred. Of course no weeds are ever allowed to appear; nothing can be more unprofitable in any garden than the growth of weeds. The first season after planting, a light crop of good fruit is generally produced; but the great crop is that of the following season, and it is to this crop the market gardener looks as a means of return. He frequently takes two crops from the same plants, but he rarely or ever exceeds this, as young plantations are always more productive.

Before the fruit begins to ripen, the space between the rows is covered with a thin layer of dry Grass or short straw, and this is done for two reasons: first, to protect the fruit from being splashed with the soil during heavy rains; and, second, in order to retain moisture in the soil. Strawberry crops suffer to a great extent in dry weather, and to water them when cultivated on a large scale is to pay for the fruit before it is gathered. Not so, however, with the amateur; with a little trouble, he may always provide against such an occurrence, by employing his leisure evenings in supplying them with water, and if liquid manure was given two or three times, just as the fruit is swelling, the crop would be greatly benefited. *Pharo.*

STORM GLASS.

This instrument consists of a glass tube, sealed at one end, and furnished with a brass cap at the other end, through which the air is admitted by a very small aperture. The tube is nearly filled with the following solution:



Camphor, ℥iss.; nitrate of potash, gr. xxxviij.; muriate of ammonia, gr. xxxviij.; water, ℥ix.; and rectified spirit, ℥xj. Dissolve with heat. At the ordinary temperature of the atmosphere, plumose crystals are formed.

On the approach of stormy weather these crystals are often observed to occupy only the bottom of the tube, where they appear to be compressed into a compact mass; while, on the other hand, during the fine weather, they assume their plumose character, and extend a considerable way up the glass. These results depend upon the condition of the air, but they are not considered to afford any indication that can be relied upon of the approaching state of the weather. When exposed to a very low temperature, the compound camphor-liniment bottle affords the same appearance and indication as these storm-glasses. *Pharmaceutical Journal.*

ENTOMOLOGY.

Sirex gigas.

At the beginning of the month of August of last year we received from a correspondent, Mr. T. Lamb, of Hurstbourne Park, Hants, several specimens of this fine hymenopterous insect, generally regarded as of very rare occurrence in this country, which had been captured singly, but frequently, at a spot where some sawyers were at work, and our correspondent had observed that the specimens with a screw-like apparatus at the extremity of the body (being the females) thrust this instrument with great force into Fir planks, when they were consequently easily taken, but the borer was inserted so firmly that it was difficult to withdraw it without injury to the insect. About the middle of the month Mr. Lamb informed us that he had succeeded in finding the Sirex gigas in the larva state, specimens of which he sent us in their burrows in Fir wood, accompanied by several specimens in the winged state, newly hatched, of the other British species, Sirex juvencus,

together with others not then emerged. Mr. Lamb's observations, however, on the injurious effects of this insect, are at variance with the general opinion on the subject, since he states that they did not appear to be in the least injurious to Fir timber, as he had in no case found them in sound wood or trees, but only in Spruce Fir, which was dead before it was cut down. Hence he conceives that the disease or death of trees may have been attributed erroneously by entomologists to the attacks of this insect. Such he believes at least to be the case with S. juvencus, considering the habits of S. gigas to be similar. Reserving, however, the history of Sirex juvencus for a future article, we may add that about the same period last year the Zoological Society received various pieces of wood attacked by this insect, from which the perfect insects were appearing in immense quantities, a short notice of which, together with a beautiful coloured plate, representing the insect in all its stages, has been published in the "Illustrated Proceedings" of the Society for last year; and about a month since living specimens were forwarded to the British Museum from Bayswater, where it had been found in considerable numbers. A correspondent of the "Gardeners' Journal" of the present year, mentions the occurrence of the insect in 1848 at Totteridge, Herts, where it was observed emerging from Fir timber grown on Enfield Chase, which was in some places quite honey-combed with them. The writer adds, that he subsequently observed the female inserting her eggs into a large stem of American Arbor-vitæ, which had been cut down only a few days previously. "After walking along the rough bark a little way and beating it with her antennæ, or rather feeling it by a number of slight blows, she seemed all at once to find a place suitable for her purpose, on which she immediately disengaged her ovipositor from a sheath in which she usually carries it, and having firmly fixed the strong sharp claws of her six legs in the rough bark, she brought the point of her instrument to the place selected, and this she managed, notwithstanding its great length, by raising up her abdomen by means of her very long hind legs, with one of which she guided the ovipositor and steadied it till it was inserted a little way; after which, having placed the leg at the proper distance, and it had become perfectly steady and quiet, no part of her body moved but the boring apparatus." She at first took about four minutes to sink a hole, inserting the ovipositor to its full length, more than half an inch.

These proceedings of the female Sirex so exactly correspond with those of the female of Ichneumon manifestator, described by Mr. Marsham in the Linnean Transactions, as to afford some slight support to the idea expressed by the Count de Saint Fargeau, that the Sirices are parasitic insects, depositing their eggs in timber already attacked by other liguivorous larvæ, and that they are not themselves destructive to timber. The great length of the ovipositor at first also seems to favour the same opinion, enabling the insect to reach the victim of its progeny at a greater or less depth in the wood; but this circumstance is contradicted by the fact that the ovipositor of other truly wood feeding insects is capable of very great elongation, as is the case with the female wood leopard moth, the Cerambycidæ, &c. Moreover the history of the Siricidæ has been so repeatedly observed in the great Fir forests of Germany, that had it been a parasite, and not a xylophagous insect, the insects upon which it subsists parasitically would certainly have been discovered long ago. No one worthy of confidence has ever obtained a Sirex from the body of any coleopterous or lepidopterous insect on which it might have subsisted as a parasite, which is sufficient to disprove the assertion of internal parasitism, whilst the larvæ of the Sirex have been observed of all sizes without there being any other insect on which they could feed; and we have at this moment before us a small piece of Fir wood containing a male Sirex juvencus in the perfect state, and two larvæ, not half-grown, without any other insect being present. This is sufficient to disprove the assumed case of external parasitism. Besides, the structure of the mouth of the larvæ of the Sirex is eminently formed for feeding upon wood.

Our figure 1 represents the larva full grown in its burrow in the wood; and figure 2, one of its mandibles with four sharp teeth, and a large molar flat plate well fitted for gnawing wood; figure 3 represents the female Sirex gigas of the natural size, and figure 4 one of its mandibles. *J. O. W.*

Home Correspondence.

Garden Gossip.—I have at last bloomed the magnificent Beaumontia grandiflora, which exceeds all the expectation I had formed of its beauty, and I must unite with Mr. Beaton in recommending it to every one who can plant it in the well-drained border of a good conservatory. The flowers of my plant are much larger than the figure in Paxton's "Magazine of Botany," and one bunch produced as many as eight; and when the purity of their snowy hue is considered, their huge size, and their fragrance, the plant may well be styled the finest known conservatory climber. Has Mr. Beaton nothing new to recommend in this class of plants? Franciscea grandiflora has this summer bloomed tolerably well in my conservatory, and would have done better had more care been bestowed upon it; it is certainly worth the attention of those who do not possess a stove; and perhaps the still finer .F. hydrangæformis would succeed equally well in the same temperature. The complaint of your correspondent in the eastern counties makes me notice a few things that have passed through the last severe winter (severe even for South Devon), uninjured. In the first place I would name a tree quite 30 feet high of Acacia dealbata, which has not even had a leaflet touched by the frost, but has been loaded with flowers. Two varieties of Eucalyptus are rapidly assuming the character of trees, and have induced me to plant others. Euonymus japonicus, with its varieties, is perfectly hardy, and stands the south-west gales in the border of an exposed terrace, where even the common Laurel and Laurustine shrink before their violence; this quality renders the shrub valuable for grounds near the sea, as the colour of its evergreen foliage is peculiarly good. In the class of hardy shrubs I must notice Philadelphus grandiflora, which is beautiful in the extreme, when loaded with its large showy flowers, after almost every other blossom of its congeners has passed away. Nothing however in early spring can vie with Weigela rosea, which undoubtedly is of pre-eminent beauty; a plant in my garden, growing against a south wall, is now between 7 and 8 feet high, and 10 wide, which has literally been a mass of flowers. I am now watching its capsules of seed with much interest, which, though small, seem likely to ripen, and thus, I hope, enable me to transmit this beautiful shrub to a friend in South Australia. Limonia Laureola seems likely to succeed well with me, a plant having stood the winter here without injury; it has made good shoots this spring, and the foliage is a deep glossy green, indicative of health and vigour; it is, however, growing in a very sheltered nook, where it only receives the beams of the early morning sun. Is it not an unusual thing for the Portulacas to come up from self-sown seeds? In my garden I have many plants now flowering strongly from seeds that fell into the ground last autumn, thus saving much trouble and labour. My varieties of Gladioli have bloomed abundantly, though the foliage was all cut off by the frost in the winter; Amaryllis vittata has flowered strongly at the foot of a south wall, and Iris susiana has been fine here and in neighbouring gardens. A border of Ixia crocata has been a blaze of beauty. In a pond, the ivory blossoms of Calla æthiopica have been unusually abundant, though the leaves were destroyed in the winter by frosts that did not, however, congeal the water the plants were growing in. Though not so numerous as usual, from the injury the young wood sustained in April, 1849, my hybrid Rhododendrons were very fine; and the size and vigour of my plants clearly prove the correctness of the statement of Messrs. Standish and Noble, that these fine shrubs do not require heath-mould to insure their success. Mine are growing in beds from 2 to 3 feet deep, of strong

alluvial soil (which almost every valley affords), apparently half loam and bog, mixed with decayed vegetable matter and leaves; and finer plants cannot be seen. *A Devonian.*

Mistletoe.—In your volume for 1847, page 816, are remarks by Prof. Henslow on the rarity of Mistletoe upon Oaks, and in No. 41 of "Notes and Queries" I observe other citations from Dr. Giles and Dr. Daubeny on the subject, which induce me to communicate to you that I have a luxuriant bunch of it now growing on an Oak of about 70 years' growth. The tree is about half a mile west of my residence, and it may interest the antiquarian botanist to add, that it stands on the earthen mound of the site of Badamscourt, once a moated mansion of the Herberts or Ap-Adams of Beachley and Llanllowell. At the request of a member of my family I add the following observations:—In Loudon's "Arboretum," ii., 1025, is given an experiment to be proved, "Whether a plant of Mistletoe would keep alive the tree on which it grows after that tree was prevented from producing either leaves or shoots?" In relation to this subject, a specimen of Mistletoe is sent you, which grew on a standard scarlet Thorn in my garden here. The head of the Thorn was above the Mistletoe, and died, as was supposed, from the Mistletoe withdrawing the juices of the tree. The whole of the head of the Thorn was then cut off, leaving the Mistletoe, which was below, still growing luxuriantly. It, however, also died in the course of the following summer, and is now sent, as above mentioned, with part of the Thorn attached to it. *Geo. Ormerod, Ledbury Park, Chepstow.* [Many thanks. There was no reason to suppose, as Mr. L. did, that the Mistletoe would keep a plant alive.]

Hardiness of Cupressus Uhdeana.—Upon looking over the valuable "Catalogue of Coniferous Plants" published in the last Part of the Journal of the Horticultural Society, I observe that the above Cypress (received here from the Society's Garden as "Cupressus sp. Mexico") is ranked among the tender kinds, or at any rate it has not the sign of hardiness affixed to it. I find it quite hardy here, growing freely in a situation where Cupressus thurifera has been killed, and Juniperus bermudiana, and J. flaccida considerably punished. I fear, however, that the same cannot be said of some of the Pinuses recently introduced by the Society. Last winter, plants in pots of Wincesteriana, Grenvillei, filifolia, and Gordoniana, stood along with various other sorts in a place where they were considerably sheltered, although not perfectly protected from the weather. Gordoniana was quite killed, and the others lost all their old leaves, and still continue in a weakly state. Now, as we know that filifolia cannot endure our winters when unprotected, and as Wincesteriana and Grenvillei suffer quite as much as that species, it is to be presumed that they are not hardy enough to be of any use in this climate. *J. B. Whiting, the Deepdene, Dorking.*

Cambridge Botanic Garden.—Parties who are likely to apply for the vacant curatorship to the Cambridge Botanic Garden may like to know the determination at which the trustees have arrived. In an interview with the Vice-Chancellor last week, he informed me that he had no doubt they would proceed to the choice of a curator so soon as they had returned to Cambridge after the long vacation, which ends early in October. He also authorised me to say that they would require of candidates a statement of the following particulars:—1. Name, age, condition in life (married or single). 2. Periods during which they had been in the service of their several employers, with the names and addresses of these. 3. Testimonials to their efficiency as general cultivators; to their respectability and good morals; and to their presumed qualifications for conducting a botanic garden which is left to their own control. As the responsibility attached to this office will be great, candidates will not object to the strictness of any inquiry it may be thought fit to institute into their qualifications; and though I cannot pretend to offer an opinion with respect to their practical knowledge, the trustees will probably wish me to make some little inquiry into the extent of their botanical attainments. It will be expected that they should have a general knowledge of the classification of plants, and possess some capacity for identifying at least the genus or order to which they belong. *J. S. Henslow.*

Eggs of the Dog-Flea.—It is much to be feared, although Dickens has kept us in the dark on the subject, that in the deranged state of affairs in David Copperfield's establishment poor little Dora allowed Jip's pagoda to be sadly neglected. In fact we are afraid that many wiser people than that delightful young couple do not pay sufficient attention, at the present season of the year, to the sleeping quarters of their pet spaniels and poodles. Mine are washed regularly on Saturday with soft soap and hot water, besides being allowed to go into the Thames, and the passage in which one of their beds is nightly placed is also well scoured with soap and water on the same day. On Monday morning last, however, on removing an old black coat which serves one of them for his bed, I observed a vast number of minute white bodies exactly like grains of very fine sand rolling about on the coat, and which I immediately recognised to be the eggs of the common dog-flea. There must have been thousands of them. They are pure white, oval, or rather of equal size at each end, and quite dry and hard, so that they roll about with the greatest ease. On shaking the coat, and carefully sweeping the floor beneath it, I found as many more eggs, besides a great number of the newly-hatched larvæ, so that had I not made this discovery we should have been swarming with fleas in a week or two's time. If, therefore, with all my care they were able to get such a head, what must poor Jip's state have been? *J. O. W.*

Puzzle.—The name of the tree is Coffee, as explained by your correspondent "J. G." *H.* [We can give no more insertion to this sort of matter.]

Araucaria imbricata.—In 1842 I planted an Araucaria in a damp situation, where it seemed to thrive till 1848, when it became yellow at one of the joints in its leader, where it exuded a resinous liquor. This continued for a year. I then transplanted it into a much drier situation, where, however, it is not doing better, with the exception of having grown freely; it is now 4 feet 10 inches high. The disease is at 3 feet from the ground, and extends upwards to the next joint. The tree is almost bare between the two joints; and although the laterals are of a fine green colour, similar resinous excrescences are showing themselves in several places. Can you assign a cause, and prescribe a remedy for the evil? *J. H.* [No.]

Ceci or Chick Peas.—I beg to enclose a few pods of "Ceci," grown in the open air in my garden. The seeds were sown in the common soil without manure in the month of February, and the plants were exposed to the severe frosts of last spring. The yield is very remunerative (better than Peas.) Abroad they eat them cooked in several ways. What is the Latin name for them, and what do you call them in English? "Ceci" is the Italian name, and the dictionary says "Vetches." Chemistry finds them more nourishing than ony other kind of legumes known, even more so than the "Arabian Lentils" (sold under the name of "Revalenta Arabica"). *J. W. Hopkins, Woodfield, Ashton-on-Mersey.* [Revalenta is "moonshine." Ceci are Chick Peas; the seed of Cicer arietinum. They are wholesome, and form the best quality of that soup which the French call *purée*.]

Mealy Bug.—I cannot discover where Kyle's liquid for destroying mealy bug is to be had. I have applied for it at several places in London as well as here (Bristol), but I cannot get it. I have thrown away a great many plants on account of this pest, and what large plants I particularly wished to keep I have had cut down, placed out of doors, and I am going to shake them well out of the pots and repot them. If I can get the liquid I shall wash them well with it, and afterwards put them in a small house by themselves, to see if it cures them. Since the plants have been out in the air they appear quite clean, not a vestige of the bug is to be seen. Will not the heavy rain cleanse them? I have had the houses well white-limed and painted. If any of your readers can suggest anything else which might be done I shall be thankful. *A Constant Reader.*

The Cuckoo.—As your correspondents seem to have composed lines of their own upon this bird, and are also in error as to the change of note, permit me to correct them. The old song is,

"In April, come I will;
In May, I prepare to stay;
In June, I change my tune;
In July, I prepare to fly;
In August, go I must."

This bird does change his tune, *i. e.*, the old ones. I have myself noticed this, and it is confirmed by many naturalists. To say it is the young offspring making attempts to cry "cuckoo," is not correct. I have been lately observing these birds. A young cuckoo often visits my fields attended by two chaffinches, its adopted parents; they bring it flies and insects, and it stoops to receive the food as they come in turn to feed it. When they go a short distance in search of more, it will fly towards them, alight upon the ground, and wait for a supply. The diminutive parents in charge are most noisy, and flutter about and around their big child when a stranger approaches. The young cuckoo is perfectly mute. The old birds this year did not change their note so soon as they usually do some seasons. Two years ago cuckoos were so exceedingly numerous in these parts as to be a nuisance. Indeed it was all day, cuckoo! cuckoo! His first visit, however, we hail with delight. *X. Y. Z., Hants.*

Hartshorn the best cure for the Sting of a Bee or Wasp.—Some are at a loss how to assuage the pain of a sting. The above is a very antiphlogistic remedy. Mr. T. Falconer, of Lincoln's Inn, when exploring the untrodden plains of Texas and New Mexico, told me he was sitting at dinner by a stranger who was suddenly stung by a scorpion; some hartshorn was instantly applied, and no fatal effects ensued, the sting being generally mortal. I have been stung by bees upon the head and face, but by the use of hartshorn I have been at once relieved, and little or no swelling of the parts takes place. *Q. R.*

The Potato Disease.—About two weeks ago we had a dense fog from the south-west, coming direct over the ocean (or British Channel to be more explicit). It was driven along in clouds by a strong wind from the south-west. The next day patches and spots appeared upon the leaves of the Potatoes. The following day whole stems were dried up and withered, as if they were "charred." The decay of the haulms was accompanied by a most offensive stench. The spot first attacked was about 4 feet square; daily the space increased; and now the disease extends the whole length and breadth of the crop. Early and late sorts are equally attacked, whereas hitherto the latter only suffered. Some are not attacked even now, but this arises from situations being sheltered from these blasts. Another such fog or wind—for I have seen it occur—will attack those which escaped in the first instance. Some say at a certain growth, or stage of maturity, the disease is self-developed. Not so. It attacks plants of all sorts, ages and sizes, and the only remedy is to dig them all up at once, or cut the haulm off even with the ground, till such time as they can be pitted. *X. Y. Z., Hants.*——The disease threatens to be severe in this neighbourhood (Cheltenham). It has attacked my crops. When the haulm is shrivelled, I have the tubers dug up immediately; those tainted are boiled with salt for the pigs, and those that are sound are spread in a cool shed to dry. I feel convinced that when a patch of Potatoes is blasted with the unknown distemper, it is worse than folly to leave them in the ground. There is no remedy to prevent great loss, but putting the Potatoes on animals' carcases, and thus sending them to market as meat instead of vegetables. Next year men must turn their attention to other roots, or they deserve to starve; we have now had five years' warning of "Potato failure." *Falcon.*——When the fatal malady appears, the only way to save the crop is to pull up the haulm and press the mould with a little additional covering on the tubers. Cutting the tops off is of no use, as it leaves part of the diseased haulm to communicate with the tubers. From three years' experience, I have arrived at the conclusion that the disease proceeds from the set, and not from atmospheric causes, except so far as cold, wet, and dull weather contribute to the more rapid destruction of the plants. Such being my opinion, in the spring of 1847 I got ready a small quantity of prepared cuttings, and planted them out about the end of the first week in May, and, although a small crop, I lost none. Last year I tried it on a larger scale, and found my plan equally successful. This year I have about 4 acres (half an acre being in our own grounds). I have been closely watching them, and I am happy to say there is as yet no appearance of disease. I also planted, on the 16th of March, six rows, about 100 yards long, of tubers, the produce of last year's cuttings (Early White-blossomed Kidney), and now they are nearly ready to take up, and still look healthy. I shall not take up any of those I have practised upon before the end of next month, and shall be happy to show them to any one who may wish to view my experiments any morning, except Sunday, from 10 to 12 o'clock. *J. S.*, 18, *Cumberland-place, St. Mary's, Newington, Surrey.*——All crops of Potatoes are diseased, therefore divest them of their stalks or haulm, "with a view of preventing total destruction to the tubers." A more efficacious mode than cutting may consist in "taking a coil of coarse rope, dipped in tar, and stretching it, set it on fire, and draw it slowly over them." *Hardy and Son, Maldon.*

Measurement of a Pear Tree.—A Ne Plus Meuris Pear tree at this place has been planted 12 years, it measures 25 feet in breadth and 12 feet in height. I have taken 800 Pears off it, and left a full crop on. *David Burton, Gardener to Lady Montagu, at Dittonpark, Bucks.*

Societies.

Trial Exhibition: Northern v. Southern raised Carnations and Picotees, *August* 7.—The exhibition for the northern division was held in Derby, in connexion with the Midland Horticultural Society, and as far as the Carnations and Picotees were concerned, it proved pre-eminently satisfactory. Middlesex, Surrey, Bucks, Bedford, Oxford, Nottingham, Leicester, Warwick, Stafford, Lincoln, Lancashire, Wilts, and Yorkshire were duly represented both by flowers and delegates. Thirty-six stands of sixes, 15 boxes of twelves, and upwards of 1000 single specimens were systematically arranged, and entirely filled the large table in the centre of the County Hall. The awards were as follows—Northern Carnations (in sixes): 1st, Mr. Dodwell, for Princess, Admiral Curzon, Seedling 31, Seedling 47, Seedling 32, Premier; 2d, Mr. Haines, for Black Diamond (Haines), Hamlet, Lady Ely, Squire Meynell, William IV. (Wilson), Lord Lewisham; 3d, Mr. Turner, for Miss Rushin, Lord Lewisham, Seedling (Hollyoake), Admiral Curzon, Seedling (Marris), Lord Byron; 4th, Mr. Buswell, for Lord Byron, Admiral Curzon, Ocean Queen, King of Scarlets, Bellerophon, Lord Milton; 5th, Mr. Bayley, for Seedling (Dodwell), Lord Milton, True Briton, Admiral Curzon, Squire Meynell, Seedling (Dodwell). Southern Carnations: 1st, Mr. Turner, for Flora's Garland, Emperor (Puxley), Poins (May), Jenny Lind (Puxley), Tybalt (May), Ariel (May); 2d, Mr. Haines, for May's Hotspur, Flora's Garland, Apollo, Ariel, Excellent, Venus (Willmer); 3d, Mr. Dodwell, for Firebrand, President, Apollo, Lord Rancliffe, Ariel, Prince Albert; 4th, Mr. Edwards, for Queen, Mary Ann, Ariel, Lord Rancliffe, Hero of Middlesex, Flora's Garland; 5th, Mr. Bragg, for Ariel, Flora's Garland, Prince Albert, Sarah, Payne, Prince de Nassau, Princess Royal. Northern Picotees: 1st, Mr. Turner, for Victoria Regina (Marris), Alfred (Dodwell), Countess Howe (Marris), Duke of Rutland (Hollyoake), Grace Darling (Marris), Alice (Dodwell); 2d, Mr. Dodwell, for Alfred (Dodwell), Princess Royal (Marris), Prince of Wales (Marris), Fanny (Dodwell), Miss Rosa (Merrywether), Duke of Rutland (Hollyoake); 3d, Mr. Bayley, for Seedling (Dodwell), Prince of Wales' Seedling (Dodwell), Iphigenia (Marris), Seedling (Dodwell), Seedling (Dodwell); 4th, Mr. Haines, for Prince of Wales, Prince Albert (Marris), Miss Rosa, Seedling (Hudson), Seedling (Haines), Pro consul; 5th, Mr. Merrywether, for Miss Rosa, Mrs. Wood (Merrywether), Lady Franklin (Merrywether), Lady Sale (Ely), Seedling 35. Southern Picotees: 1st, Mr. Turner, for Mrs. Barnard, Juliet (May), Cleopatra (May), Green's Queen, Viola (May), Lorina (Burroughes); 2d, Mr. Merrywether, for President, Delicata (Holliday), Jessica (May), Princess Royal (Willmer), Mrs. Barnard, Green's Queen; 3, Mr. Dodwell, for Green's Queen, Juliet, Mrs. Barnard, Lorina, Venus (Headley), Gem (Youell); 4th, Mr. Bragg, for Gem, Lady Harriett Moore, Princess Royal, Juliet, Venus, Jenny Lind; 5th, Mr. Bayley, for Isabella, Mrs. Barnard, Juliet, Lorina, Venus, Princess Alice (Wood). Single Blooms in Classes—Scarlet Bizarres: 1st, Admiral Curzon, Mr. Buswell; 2d do., Mr. Haines; 3d, do., Messrs. Scholefield; 4th, Seedling. Crimson Bizarres: 1st, Jenny Lind, Mr. Turner; 2d, do. do.; 3d, do. do.; 4th, Black Diamond, Mr. Haines. Pink Bizarres: 1st, Prince Albert, Mr. Bragg. (The paucity of blooms in this class prevented any further award.) Purple Flakes: 1st, Squire Meynell, Mr. Buswell; 2d, Lord Byron, do.; 3d, Premier, Mr. Barringer; 4th, Squire Meynell, Mr. Haines. Scarlet Flakes: 1st, Duke of Devonshire, Mr. Barringer; 2d, do. do.; 3d, do. do.; 4th, do. do. Rose Flakes: 1st, Lady Ely, Mr. Haines: 2d, do. do.; 3d, Princess Royal, Mr. Turner; 4th, Flora's Garland, Mr. Haines. Heavy Red-edged Picotees: 1st, Picnic, Mr. Harrison; 2d, Isabella, Mr. Haines; 3d, Picnic, Mr. Harrison; 4th, King James, Messrs.

Scholefield. Light Red: 1st, Seedling, 70, Mr. Dodwell; 2d, Paymaster, Mr. Harrison; 3d, Gem, Mr. Buswell; 4th, do., Mr. Barringer. Heavy Purple: 1st 2d, 3d, Alfred, Mr. Dodwell. Light Purple: 1st, Leader, Mr. Barringer; 2d, Leader, do.; 3d, Juliet, Mr. Turner; 4th, do., Mr. Dodwell. Heavy Rose: 1st, Green's Queen, Mr. Turner; 2d, do., Mr. Dodwell; 3d, Venus, Mr. Turner; 4th, Victoria Regina, do. Light Rose: 1st, Mrs. Barnard, Mr. Dodwell; 2d, do., do.; 3d, do., do. The Premier Prizes were awarded to Mr. Turner, of the Royal Nursery, Slough, for his stand of Southern Carnations, six magnificent specimens; and to his stand of Northern Picotees, also displaying the highest skill in cultivation, combined with the rarest quality. First-class Certificates were awarded to Mr. Turner, for Fuxley's Jenny Lind, C. B., decidedly the finest of its class; to Mr. Barringer, for his seedling scarlet flake, Duke of Devonshire; to Mr. Wood, for Robinson's Elizabeth (heavy red Picotee), a flower of fine properties, well margined with bright red, and extra fine in the white or ground colour; and to Mr. Dodwell, for Alfred (heavy purple), a variety which has obtained a number of awards altogether unprecedented. An immense number of seedlings was produced. Those especially calling for notice were Marris' Grace Darling, Countess Howe, Victoria Regina, and Hollyoake's Duke of Rutland (exhibited by Mr. Turner), all of first-class quality, and such as will hereafter be seen in every leading stand. Harrison's Picnic, as shown, was too small to make a first-class flower; high cultivation may, however, remedy this.

Garden Memoranda.

Messrs. Loddiges' Nursery, Hackney.—In consequence of their lease having nearly expired, and their not intending to renew it, Messrs. Loddiges will have to give up the greater part of the ground now occupied by them, and remove the stock and contents of the glass houses to their own property close beside the old nursery. In furtherance of this object they have already built on their freehold ground a span-roofed house for the accommodation of Orchids, and it is intended to add others on either side of it, as may be required. This house is 70 feet long, nearly 20 feet wide, and about 8½ feet high. The roof is supported at 5 feet from the ground on brick walls, and is constructed with Montgomery's 2½-inch sash bars, without rafters. It is glazed with Hartley's patent rough plate glass, in panes 14 inches by 10 inches; and is fixed and immoveable in every part. Ventilation is effected by two openings in the brick-work, each 2 feet wide by 8 inches high, and a ventilator over the door in the one end, and two similar openings in the brick-work in the other end. This is considered by Messrs. Loddiges to be sufficient for Orchids, which, however, have been found not to succeed without shading, even under the rough plate glass. No blistering or scorching has been perceived; and, although the plants have not been long in the house, their liberal production of young roots sufficiently indicates that they like their new situation. The heating is accomplished by means of hot water, in 420 feet of 4-inch iron piping issuing from two of Mr. Shewen's small-sized boilers. This may be considered a large heating power, and so it is; but both boilers are not likely to be required except on occasions of very severe weather. The plants are arranged in a bed in the centre of the house, and on slate shelves round the sides. Among them was a fine specimen of Lælia superbiens, purchased at one of Mr. Stevens's sales, beginning to throw up flower-stems. Oncidium Lanceanum and its large flowered variety were in bloom in this house, as were also the sweet smelling Aerides quinquevulnera, the larger variety of Dendrobium longicornu, and some other Dendrobes. In the other houses few things were in flower, except here and there the beautiful Dendrobium chrysanthum, which blossoms regularly twice a year; the pretty little D. aduncum, Sobralia sessilis, and some Saccolabes and varieties of Aerides quinquevulnera.

Miscellaneous.

Sale of Cape Heaths.—Upwards of 200 plants, for the most part large and admirably cultivated, the property of S. Rucker, Esq., of Wandsworth, who has given up Heath growing, were sold by Mr. Stevens, on the 9th inst. The prices they fetched were as follows:—Obbata, 11*l.*; tortiliflora, from 5*l.* to 10*l.*; Elegans stricta, 8*l.*; Hartnelli, 7*l.*; the variety of Hartnelli called virens, 5*l.*; metulæflora, 7*l.*; Cavendishii, ditto; vasæflora, 6*l.* 10*s.*; the larger variety of aristata, 5*l.*; inflata, 5*l.* 5*s.*; ampullacea rubra, 4*l.* 4*s.*; the two-coloured variety of metulæflora, 4*l.*; tricolor rubra, 3*l.* 15*s.*; t. Rollissoni superba, 3*l.*; suaveolens, ditto; obbata umbellata (a very large-flowered Heath), 2*l.* 4*s.*; splendens, 2*l.* 8*s.*; Massoni, 3*l.* 3*s.*; Parmentieri rosea, 2*l.* 12*s.* 6*d.*; ferruginea, 2*l.* 2*s.*; and mirabilis, 2*l.* 15*s.* Other lots ranged between 1*l.* and 2*l.* per lot.

The Hydrostatic Syphon Water Purifier.—This machine delivers (per day) a stream of from 150 to 200 gallons. The instrument is externally white metal, 4 inches in diameter, and 7 inches high. To set it in action it only requires to be dropped into the water, and the pipe hung down outside. It purifies rain, river, tank, pond, or pump water, however dirty, the water retaining all the atmospheric air, on which the freshness of the taste depends. It is especially adapted for ships on long voyages, and cases where a never-failing supply of good water is desired. It is said that if put into a bucket, the bucket being kept constantly full, and suspended about 6 feet from the deck, it will supply water of the greatest purity for a ship's company of 300 men.

Propagation of Plants by Cuttings.—This is one of those manipulations in gardening which require more than an ordinary degree of skill in its execution, and from the exceedingly varied success of different individuals, one would suppose that something more than mere practice is necessary to ensure complete and unvarying success. This fact is more apparent when we consider the numerous casualties by which cuttings are affected, and our imperfect knowledge of the laws that govern the mysterious organisation of vegetable life. This diversity of success may partly arise from the different notions which different persons have of the same thing; and it may frequently be traced to an unwarrantable reliance which some persons place upon certain points of practice, having, in reality, no relation to the demonstrable theorem upon which the subject in question rests. Everyone acquainted with the art of propagation is aware that, under certain conditions, cuttings will grow and make shoots without forming rootlets; while under others, the same cuttings will produce rootlets without manifesting the slightest elongation of its external buds. Again, under certain circumstances, the leaves of some kinds of cuttings will turn yellow and decay, while under others, the same kind of cuttings will remain green and healthy for months together, even without forming roots. The effect produced upon one subject is precisely the same upon all subjects of a similar nature, placed in the same conditions, proving that the art of propagation is not (as it is in the hands of many) the mere consequence of an unguidable operation, successful or otherwise, as chance may direct, but that it is founded upon principles which cannot be violated with impunity, if we wish for satisfactory results. From these observations it is obvious that some more is requisite than merely to know how to make a cutting and prepare the place for its reception; and although these matters also require some attention, it appears to me that they are the least important parts of the process; and from the want of a proper recognition of the other parts, many of the failures that occur may be attributed. It is therefore my intention to treat upon some of those points which are necessary to ensure success in this interesting and important branch of horticulture. Conflicting opinions have been given upon the influence of leaves in enabling the cutting to emit roots. Some very successful propagators maintain that the more leaves left upon a cutting the more rapidly will roots be emitted; and in particular cases this is partly true. It is no less true, however, that cuttings entirely divested of leaves, will also produce roots abundantly, and that too, under conditions seemingly less favourable than in the former case. These considerations involve a highly important question in vegetable physiology, and one that has not, so far as I am aware, received that amount of attention which it deserves. Something like the following argument has been adduced by various propagators, in favour of their system of retaining the leaves, even to the base of the cutting, when practicable;—that there is no suspension of vital energy, as the leaves continue to perform their proper functions, and thus prepare, at the very time it is most required, a supply of organisable matter, which is immediately expended upon the formation of rootlets; and that this suspension will be regulated by the number of leaves, and their distance from the base of the cutting; the assimilated matter for the production of fibres being secreted rapidly or otherwise, according to the quantity and quality of the leaves left. From this we are led to infer that the matter of which the rootlets are formed, is the result of and dependent upon the assimilating powers of the leaves. Hence, according to this train of reasoning, we can arrive at no other conclusions than the following:—The more leaves left upon a cutting, the sooner will it root, and when leaves and other means of assimilation are absent (as is frequently the case), roots will not be formed at all. We know, however, that both these inferences are erroneous, and more especially with regard to the latter, from the fact that roots are produced in abundance without the aid of leaves, and this certainly could not be the case, if the nodules that are formed previous to the emission of roots, were produced by any safe elaborating process. Although we allow that the young bark of some plants does, under certain conditions, perform the same functions as the leaves, it is only an exception to a general rule, and can have little effect either for good or evil on the subject in question. We cannot therefore regard the above argument as giving a satisfactory explanation of any superiority possessed, or advantage to be gained, by retaining leaves on cuttings. Leaves are not absolutely necessary for the formation of roots. Instances have come under my own observation of bulbs doubling their size and filling a large space with roots, when covered with 4 or 5 inches of soil, without producing a single leaf; and every gardener is aware of the beneficial effects resulting from the application of a genial warmth (bottom heat) to the roots of plants, which is neither more nor less than getting the roots, as it were, a stage in advance of the foliage. On the same principle, unhealthy plants, as Camellias, Oranges, &c., are resuscitated by keeping the roots warm and the tops cool, to ensure a healthy and vigorous action of root, previous to exciting the stem and branches; and this is often done after the plants are entirely divested of leaves. There are others who do not ascribe so much influence to the leaves, but assert that the rootlets are produced from the stored-up sap existing in the cutting at the time it is planted. Acting upon this supposition, they are careful in keeping the soil moist, and covering the whole closely with a glass, preventing communication with the external air, in order to avoid mechanical evaporation. This may seem plausible enough, but if we insert a deciduous cutting into moist earth, we will find, in the course of a few weeks, a mass of newly formed tissue at the lower end. Has this been produced solely from the stored-up sap? All the sap that existed in the cutting could not have formed such a mass of matter as we frequently find accumulated at the base of very small cuttings. In this, as in the case of bulbs, it is evident that the roots are not formed exclusively from the stored-up sap. Further,—to show the futility of the opinion, that the emission of roots is dependent upon elaborated sap, let us look to the conditions under which a cutting with leaves,—supposed to be under good management,—is usually placed. We find it closely covered with a bell glass, and shaded from light, and instead of giving it the benefit of a little fresh air occasionally, the water required to moisten the soil is applied outside the glass, and the latter will not be removed for weeks together. The fact of roots being formed under these conditions is a convincing proof that it is not through the agency of leaves, as will be seen from the following extract:—"It is from the continued assimilation of the elementary constituents of plants, that new products result for the formation of woody fibre, and all solid matter of a similar composition. This assimilating process is principally carried on in the leaves, or occasionally in the young green bark. To enable the leaves to perform their functions, they must be exposed to light and air, especially to air in motion, for without these be allowed to act upon them they cannot exercise their power of assimilation." We see from the above, that leaves confined under a bell glass and shaded from light, cannot perform their functions, and of course cannot benefit the cuttings, nor remain long in a healthy state, consequently they ought to be exposed to as much light and air as their altered conditions will permit, and bell glasses dispensed with as far as possible, as their use is only substituting a greater evil to counteract a lesser. Scientific research has failed to discover the true nature of the chemical changes and transformations that are constantly being produced in the interior of plants. The vital principle seems to guide and direct the various combinations that the simple elements which they absorb, undergoes within their vessels. But the process by which the elaborated sap is converted into cellular tissue, or any other form of vegetable structure, or the mode in which water and carbonic acid are changed into gum or sugar, is, and may for ever remain a profound mystery. From the view I have taken of the subject in question, I am led to the conclusion, that the callosity formed on the base of a cutting, is produced by the aqueous matter which it absorbs from the soil, mingling with the stored-up sap, and undergoing a change in the interior of the shoot, analogous, probably, to that carried on in the germination of a seed.* Judging from the external appearance of this accumulated matter, some such combination appears likely, as it is apparently a mass of imperfectly organised woody fibre. As it extends, it takes the appearance and performs the functions of a spongiole, and gradually becomes converted into true woody fibre, as the cutting increases in growth. It is not to be inferred from the above that the whole of the leaves ought always to be removed from cuttings; this, in the majority of cases, would be positively injurious; but I think it sufficiently clear, that the leaves perform no active part in the first formation of roots; consequently they ought not to be excited into growth, but placed in the lowest average temperature consistent with the nature of the plant, while the soil in which they are inserted should approach the highest range of temperature the roots will endure; to stimulate into activity the processes carried on in the vessels beneath the surface of the soil. And the more completely the upward growth of the cutting is retarded until rootlets are formed, the greater chance has the cutting to thrive. The great stimulants of vegetable life are heat, air, light, and moisture; and in the management of cuttings, these agents require to be regulated with the greatest nicety and precision. The more leaves upon a cutting, or the softer its texture, the more care is necessary, as it is the more liable to suffer, either from excess or deficiency of any one of these agents. For instance—if the cutting is subjected to a high temperature, it will cause an immediate expansion of its buds, and elongation of stem and leaves. Or, if under the influence of an arid atmosphere, the dry air will quickly act upon the moist leaves, exhaust the sap, and render them flaccid. The same result will follow if light be admitted in excess, as it will paralyse the energies of the cutting by a too rapid decomposition of carbonic acid. Again, if the soil be kept too dry, there will be no accumulation of matter at the base of the cutting, the dry soil absorbing it as fast as produced. On the other hand, if water be administered too copiously, the total destruction of the cutting will rapidly ensue; if decomposition once commences, it soon communicates its qualities to the whole. In this, as in many other horticultural operations, no definite rule can be prescribed, to be equally applicable in every case. Hence, the many contradictory directions often given upon the same subject, which may be either right or wrong, just according to circumstances. There are various methods of modifying the extreme influence of the agents employed in the economy of vegetation. While cuttings are forming roots, the presence of light may be modified by keeping them a sufficient distance from the glass, or by inserting them into a large pot only half filled with soil. A humid atmosphere is easily maintained by the evaporation of

* Diastase is always present in the germination of seeds. The Willow contains a large quantity of starch among its woody fibre, and cuttings of it emit roots freely. May not diastase be formed at the base of the cutting, to transform the starch and render it soluble and fitted for facilitating the emission of roots? And may we not form an idea of the facility with which cuttings strike root, by the amount of starch contained in their structure?

water; and to prevent saturation in the soil, the pots ought to be well drained. By inverting a small pot inside a larger one, a chamber is formed, which allows a salutary access of air and heat to the base of the cutting; at the same time affording a ready egress for superfluous moisture. It may appear difficult to secure at all times the exact conditions required; nevertheless they should be aimed at, and the nearer they are attained, the sooner will the cutting form roots. It is only from a happy combination of all the essential points that we are to expect constant success; and the latter will follow in an exact ratio as the harmony of the elements of growth are secured. *W. Saunders, in Hovey's Magazine of Horticulture.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

The propagation of greenhouse Pelargoniums should have a due share of attention at this season. The large kinds may be cut down according to the usual practice, and cuttings selected from the shoots so cut off; but with the fancy varieties a different course must be pursued; most of these produce such a profusion of flowers, that, if left to their ordinary course, it is impossible to obtain any proper shoots for cuttings. By picking off the flowers as they appear, and encouraging the growth of the plants by rich soil and liquid manure, the extreme points will make cuttings, and the young side shoots will produce cuttings in abundance.

FORCING DEPARTMENT.

Pineries.—Unless the fruits in progress are supported in some way, they are very liable to lean to one side, by which they are always disfigured, and not unfrequently are entirely broken off. This of course must be prevented, by staking and tying in a perpendicular form, before they become too heavy. Vineries.—Where ripe Grapes are hanging a gentle fire should be used in damp weather, to dry the atmosphere, taking care to accompany it with a due proportion of air, to allow the evaporation to escape. Moisture must be carefully avoided, or some of the thin-skinned varieties will be liable to crack; this is an additional reason for covering the outside borders with a tar cloth, to throw off excessive rain. It is readily drawn or rolled off during fine weather. Keep these houses clear of everything calculated to generate damp, especially plants in pots, which frequently require to be watered or syringed; the kinds which generally occupy such places may be very well accommodated in the open air for the next month or six weeks.

FLOWER GARDEN AND SHRUBBERIES.

Everything in this department should wear an appearance of order and perfect neatness, and this state of things can be effected and maintained only by a systematic perseverance in going regularly and frequently over the whole. Considerable attention is necessary to keep the half-hardy plants and annuals in order, especially in cutting back any Box or other evergreen edging by which they are bounded; at the same time, tall or straggling growths of plants in masses should be shortened. If this is done with taste the beds may be made regular and uniform, without being formal. At planting out season, for the sake of immediate effect, the beds are generally filled rather thickly; in consequence of which a careful thinning may be useful, especially where over-crowded plants are liable to be injured at the bottom, as is the case in low, damp places. Great pains have been taken within the last few years to improve the Hollyhock, and it is now becoming a general favourite. It is admirably adapted for the larger clumps, and especially the light-coloured varieties, for planting along the edges of the evergreen masses, to relieve their monotonous appearance. As no reliance can be placed on the plants which are raised from seeds, they should be proved as to colour and quality, before they are planted permanently. The select varieties are easily propagated by eyes from the strong parts of this year's wood. In selecting them, care should be taken to choose those which have an incipient leaf-bud at the base of the leaf, and to reject those which are developing flower-buds only. The cuttings should be prepared by splitting and cutting the stems up into lengths, leaving about 2 inches below the bud, and paring away the pithy part; they should then be planted about 1 inch deep in a frame of very sandy soil, and carefully shaded; if they can have the advantage of a little bottom-heat, so much the better. It is only necessary to mention further that the operation should be performed as soon as the good and bad varieties are distinguishable.

FLORISTS' FLOWERS.

Carnations and Picotees.—The early pipings will now be sufficiently well rooted to pot off. They may be placed two in each pint pot, or if the amateur has plenty of room for wintering, one in each will be better. The plan of piping these flowers is not so frequently adopted as it ought to be; when done early, and carefully attended to, they root almost as well as Pinks, besides having the advantage of making stiff handsome plants. Those which have been layered must be regularly watered, to ensure their well rooting. Examine the pods; those which show for seed must have the petals extracted, the others may be cut off. Seedling plants may be pricked out on well prepared beds for next year.—Do not forget to look over Ranunculus roots to see whether they are all right; it must be remembered that if they contract mouldiness it is fatal to them, and collections are sooner lost than gained. Tulip growers are on the *qui vive;* the great exhibitions in the north are having their effect on the fancy. We would advise those who wish to infuse a little new blood into their collections to inquire now, or they may be forestalled. The first convenient opportunity, clean the bulbs from their dry skins and roots; discard those which would not pass the ordeal of fair criticism during blooming time, and fill the vacancies as soon as possible. Pansies at this time of the year require a considerable quantity of water; continue to shade young plants in hot weather. Mark late blooming seedlings, if they have any symptoms of novelty, to try again, as they will possibly very much improve in the spring.

KITCHEN GARDEN.

Cleaning the borders, clipping the edgings of Box and Thrift, and weeding and repairing the gravel walks, is now the principal work in hand. If the Cardoon is much in request, and the probable supply deficient, a very good substitute may be produced by cutting the old flower-stems of the Artichoke down, thinning the young suckers, and afterwards binding and earthing them in the same manner as real Cardoons. If the ground is good, the strong suckers will be ready for binding with hay ropes and earthing up by the middle of October, and they will be ready for use at Christmas. The earthing up should be done at one operation, for the same reasons as were given in support of similar practices with regard to Celery. Sow some Radish seeds of sorts once every three weeks until the end of September, when a supply will be obtained through the winter. The two last sowings should be made upon a warm south border, along with a small bed of American and Normandy Cress, to stand the winter. Occasional sowings of Corn Salad should also be made.

State of the Weather near London, for the week ending Aug. 15, 1850, as observed at the Horticultural Garden, Chiswick.

Notices to Correspondents.

Bees: *E H.* In the form of touch-paper, but the fungus is better and much less injurious to the bees. *Y.—J B.* Payne's. *Y.*

Berberis Aquifolium: *A R.* Preserve the berries like Raspberry jam. They are harmless.

Carbonate of Ammonia: *J B.* You may use it as you propose, but with no greater advantage than in the common way. There is no fixed proportion between the carbonate and water. Make it very weak.

Compost, &c. &c. &c.: *A Country Curate.* Mix your materials and leave them in a heap for a couple of months, or till they are rotten. Add wood-ashes, soot, &c., *ad libitum,* and drench the whole from time to time with chamber-lye if you can. Such stuff is good for everything. Cut your Laurustinus when you like; now is as good a time as any. Remove Wistaria in winter; it propagates freely by layers. You can do nothing with the Couch Grass except fork it out. It does not answer to cut down and regraft old Cherry trees; they gum to death. If you graft it at all, only head back to branches as thick as the forefinger.

Cucumbers: *A M Sheppard.* It may do for shows, but it is unfit for table use. We found it spongy, watery, full of seeds, and with a long narrow neck. All faults of the worst sort.

Eriostemons: *A Young Gardener.* The leaves are attacked by "spot," a disease found to be connected with too much wet. Either they are over-watered, or not half ventilated, or the pots are water-logged, or they are overshaded; you only can judge of the manner in which over-watering takes place.

Fuchsia spectabilis: *H.* See pp. 71 and 103 of the current year's volume.‡

Insects: *Lady C L.* The insect of which you have sent us a drawing is the caterpillar of the puss moth (Cerura Venula), probably so named from its resemblance to a tiny kitten, as suggested by you. *W.—Bucks.* The insects on the Larch twigs appear to be Cherines Laricis, but they were all dead and shrivelled up before reaching us. *W.—Sub.* The blotches on the Rose leaves do not appear to have been caused by insects. The holes in the leaves are gnawed by the larvæ of the antler saw-fly. *W.—F C.* It is not necessary to examine the mouths of all insects in order to ascertain their names, since variations in its different parts is almost always accompanied by external characteristic differences. Your insects are: 1, Allantus viridis; 2, A. scalaris; 3, A. Ribis, male; 4, A. Ribis, female; 5, A. cinctus, female; 6, A. cinctus, male; 7, A. parietum, female. *W.—Ravenswood.* The animal like a stick found on a Rose bush is the looper-caterpillar of the swallow-tail moth (Ourapteryx sambucaria). *W.—W R.* Your caterpillar and other insects, with their numbers, were a mass of broken scraps at the bottom of the box. The former, although shrivelled, appears to be that of the drinker moth (Odonestis potatoria). The black beetle was Copris lunaris; the striped beetle, Clytus arietis; the short-winged beetle, Creophilus maxillosus; and the larger moth, Hepialus fuscus. We know no hawk moth caterpillar with white lines arranged diamond-wise. The Lanti africanus fermentus must have been a joke. *W.—F A P.* The leaves of the blush Roses are attacked by the larvæ of a minute two-winged fly (Cecidomyia sp.). We have never before observed such a case, and will endeavour to rear the insects. Can you send us some more leaves in a damp state? *W.—T S P.* The Istrian Oak timber from Pembroke dock-yard is attacked by the wood-boring beetle (Apate capucina). We should be glad of a bit of the wood showing the burrows, and especially if it contains the larva. *W.—Chirurgiais.* The pods of the Lathyrus pratensis and Vicia sativa are infested with the larva of a Bruchus, which shall receive our attention, and which will form one of our entomological articles. *W.—T D H.* The insects are a minute species of spring-tails (Podura), as we supposed. We do not consider them to be injurious to growing vegetables. *W.*

Leaves: *J Trotter.* Either we have answered your enquiry, or the leaves in question have never reached us. We answer *all* enquiries that have anything to do with the business of this Paper.

Manure: *Juvenis.* If you have the convenience, by all means make your compost heap under cover. You may mix guano or bones with the materials you mention with advantage.‡

Mushroom Spawn: *Agarious.* If it filled a bushel it was a bushel full; if it did not it was not; that is all we can say. We cannot cube the pieces of spawn and compare them with the cubic contents of a bushel. If you are curious enough you may do that for yourself.

Names of Plants: *Jane Anne.* Lastrea Thelypteris. *S.—W H M.* 1, Gymnogramma chrysophylla; 2, Adiantum trapeziforme; 3, 4, and 5, Pteris longifolia; 6, Platyloma flexuosa; 7, Davallia canariensis; 8, Diplazium striatum; 9, Davallia pyxidata; 10, Cassebeera hastata; 11, Doodia caudata; 12, Cassebeera hastata; 13, Didymochlæna truncatula; 14 and 19, Pteris tremula; 15, Nephrodium molle; 16, Platyloma flexuosa; 17, Blechnum occidentale; 18, Nephrodium molle; 20, Lastrea hirta (?) 21, Platycerium alcicorne. We advise you to get some books on Ferns and study them, for learning them in this off-hand way is not commendable, as any names will answer your purpose as well as the correct names. *S.—A Somerville.* Eriophorum polystachyum—the Cotton Grass. It has no affinity to the Cotton plant.—*W R.* All Lilies will occasionally produce bulbs on the stem. Some of them, tigrinum, for instance, always do.—*Erzeroum.* 277, Crepis pinnatifida; 344, Xeranthemum inapertum; 343, Hieracium, perhaps collinum.—*R S.* Selago fasciculata, a common old-fashioned greenhouse shrub. We never saw it used for beds, and should fear that its colour is too pale.—*A Beginner.* Pteris longifolia. If the wood of your Peach-tree is ripe, scrub off the scale with a brush and hot water.—*Adelaide.* 1, Rhodochiton volubile; 2, Aristolochia, near ciliosa—specimen insufficient for determination.—*Coniston.* 1, Allium vineale; 2, Allium ursinum; 3, Coriander.—*R E.* 1, Stanhopea Wardii; 2, S. graveolens; 3, 3, Lycaste plana, a bad variety.—*P P.* Les Orchidées ne sont pas encore arrivées, 15 Aout.—*A Young Gardener.* It does not seem different from Juncus acutiflorus, but it is too young for exact determination. It should be in fruit.—*Ruby.* Leycesteria formosa.

Native Countries of Conifers: *Pinetum.* Thuja aurea, Gardens; Thuja Wareana, North America; Cupressus Uhdeana, Mexico; Cupressus majestica, unknown to us; Juniperus repandens, ditto; Pinus Russelliana, Mexico; Cephalotaxus Fortuni, China. Pinus Mughus and Pinus Pumilio are identical.

Nymphæa: *A H* is assured that a double-flowering variety of the English Water-Lily, of which the blossoms assume a conical form, is cultivated at Navestock, near Romford, in Essex. Do any of our readers know of such a plant, and whether it is procurable?

Pelargonium Monstrosity: *Ravenswood.* It is very curious, but quite harmless. We will very soon give you some account of it, and a woodcut in illustration.

Rose Leaves: *Cymro.* Those of No. 6 are dying, as is usual with the class of Roses to which Great Western belongs. Probably the stock and what it bears are quarrelling. The "red insect" is the fungus called Uredo Rosæ.

Rust in Grapes: *W M.* This arises from the skin of the berries having been killed at some early period. Twenty ways in which it may have been killed could be pointed out—cold currents of air, greasy hands, greasy hair, sulphuring, smoking, &c. &c., may produce the effect. There is no remedy; but prevention demands nothing more than care. Some sorts of Grapes are affected more easily than others.

Strawberries: *Careful Reader.* The Hautbois do not set, because your plants are entirely female. You must obtain males; they are generally far too abundant, and probably exist in the nearest garden of any size. Better still get some Prolific Hautbois in place of your own. If you cannot, and will give us your address, we will put you privately in the right way.—A Mr. *John Roberts* has for some time past been endeavouring to force into notice certain harmless horticultural nicknacks, of which we have the misfortune not to perceive the merit. Some remarks on the Strawberry at p. 483 have produced an explosion of ill humour from this gentleman, in the form of a letter, which he expects us to put among our correspondence. He thinks we must have a large stock of burrs to dispose of (!), or we could not have treated his tiles so ill. We are sorry not to oblige him by complying with his request, but we never knowingly insert puffs, unless among the advertisements. As to the small crotchet which we have unluckily set our heel upon, we can only add, that after trying it fairly, and having seen it tried experimentally, it appears to us to be very dear and very useless.

Tobacco: *Aberhonddie.* To prepare the leaves for smoking, hang them up in an airy shed for a time, to dry; then throw them in a heap to ferment; dry again, press down, and the work is finished.‡

Yellow Jasmine: *A T.* It is readily propagated either by cuttings or layers. Insert the cuttings in silver sand or light sandy soil, and keep them in a close frame for a short time till they strike root. ‡

SEEDLING FLOWERS.

Gloxinias: *X Y Z.* Pretty, but not better than kinds possessing the same colours already in cultivation.*

Hollyhocks in Single Blooms: *W Chater.* Rosea alba, pretty, but superseded by your Rosy Queen, which is a well-formed flower, with a bright yet delicate rosy centre, surrounded by paler outer petals; Spectabilis is a large showy rose, but somewhat coarse; Rosea grandiflora (not very new) is a well-shaped pink, of medium size; Purpurea elegans, distinct in colour, and desirable for the sake of variety; Snowball Superb, an extremely good and well-formed white; Walden Gem, an improvement on the fine variety called Comet, both in colour and shape; Orion, like Walden Gem, but a shade lighter; Pulchella, not new, but one of the prettiest and best shaped Hollyhocks in cultivation; Gem, not sufficiently distinct from Walden Gem.*

Pelargoniums: *Ajax.* Flowers dropped to pieces when received; colours good, shape apparently but middling.*

Picotees: *S A.* Your heavy or medium edged red Picotee is a good second-rate variety. It will be useful, there being so few heavy reds. It is inferior to Marris's Prince of Wales.*

To our Correspondents.—May we beg it to be understood that *we cannot answer inquiries privately through the post.* We are ready to give reasonable information through our columns, but we cannot consent to the labour of writing letters.

*** As usual, many communications have been received too late, and others are unavoidably detained till the necessary inquiries can be made. We must also beg for the indulgence of those numerous correspondents, the insertion of whose interesting contributions is still delayed.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

EDENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses, when completed charged, from 1s. 3d. to 1s. 6d. per superficial foot, according to size and quantity; on one principle the roof is formed without wood or putty, and on another principle with wood rafters, and the glass put in with putty. Patent Sashes, requiring no paint, from 7d. to 9d. per foot. HEATING BY HOT WATER.

CORN MANURE FOR WHEAT, BARLEY, OATS, BEANS, &c. &c.

THE LONDON MANURE COMPANY most confidently recommend the above, as they are daily receiving very satisfactory accounts from parties who used it with great success last season. It will be found fully equal to and much cheaper than Peruvian Guano, and is not so liable to produce so large a growth of straw. Price Seven Guineas per ton, 3 cwt. per acre. They also beg to offer their Concentrated Urate, Superphosphate Lime, Nitrate of Soda, Sulphate and Phosphate of Ammonia, Fishery and other Salt, Gypsum, Sulphuric Acid, and genuine Peruvian Guano. To insure this free from adulteration, all purchasers can receive it direct from the Warehouses of the Importer.

Bridge-street, Blackfriars. EDWARD PURSER, Secretary.
Country Dealers and Agents supplied.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

Corn and Grass Manure, per ton	£10 0 0
Clover Manure, do.	11 0 0
Turnip Manure, do.	7 0 0
Superphosphate of Lime	7 0 0
Sulphuric Acid and Coprolites	5 0 0

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9l. 15s. per ton; and for 5 tons or more, 9l. 10s. per ton, in dock. Sulphate of Ammonia, &c.

PERUVIAN GUANO.—As Agents of the Peruvian Government for the importation and sale of this valuable MANURE, we think it right, for the protection of consumers and respectable dealers, to apprise them that the adulteration of the article is still extensively practised, and to recommend them to apply either to ourselves, to our agents, Messrs. GIBBS, BRIGHT, and Co., of Liverpool and Bristol, or to dealers of established character, in whose honesty and fair dealing they can place implicit confidence. ANTONY GIBBS and SONS.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

FOR WATERING GARDENS, BREWERS' USE, &c.
FLEXIBLE INDIA-RUBBER HOSE PIPES.

JAMES LYNE HANCOCK, Sole Licensee and Manufacturer of the PATENT VULCANISED INDIA-RUBBER PIPES and TUBING.

These Pipes are well adapted for Watering Gardens, conveying Liquid Manure, racking Beer and Cider, Gas Fittings, Chemical and all purposes where a perfectly sound WATERPROOF and FLEXIBLE PIPE is required.

Hot Liquors or Acids do not injure them. No oil or dressing is required in using them. They do not leak from remaining out of use, are permanently Flexible in all Temperatures, and are therefore particularly suitable for Fire Engines; and, from their not leaking, are found exceedingly useful in conveying hot or cold water to baths in dwelling houses and such like purposes.

A LIGHT VULCANISED INDIA-RUBBER HOSE is now manufactured for conducting Water and Fluids, at the following prices per foot:

Size.	¼ in.	⅜ in.	½ in.	¾ in.	1 in.	1½ in.	2 in.	2½ in.	3 in.
1 ply ...	0s. 5d.	0s. 6d.	0s. 8d.	0s 10d.	1s. 0d.	1s. 2d.	1s. 4d.	1s. 6d.	
2 ply ...	0 8	0 9	1 0	1 2	1 5	1 8	2 0	2 3	
3 ply ...	0 11	1 0	1 3	1 6	1 10	2 2	2 9	3 3	

N.B. Vulcanised India-Rubber Garden Hose fitted with roses, jets, and branches, complete, with union joints ready to attach to pumps or water cisterns.

All orders or letters addressed to J. L. HANCOCK, at the Manufactory (and Warehouse), Goswell-mews, Goswell-road, London, will meet with immediate attention.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, especially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the Nobility, Gentry, and Clergy, for out-door work at their country seats, The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.

Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to WALTER CARSON, No. 9, Great Winchester-street, Old Broad-street, Royal Exchange.

No Agents.—All orders are particularly requested to be sent direct.

STEELE'S PREPARATION, for preventing Weeds, Moss, &c., from growing on Parades, Garden-walks, and Roads. Sold in 5-gallon bottles, at 1s. 6d. per gallon.

Also, PEAT, BOG-EARTH, and LOAM, in bags not less than 5 cwt., at 9d. per cwt.

Orders, enclosing Post-office orders made payable to JONATHAN STEELE, Post-office, Dockhead, immediately forwarded to any part of the country.

Factory, Plough-road, Rotherhithe.

QUEEN'S COLLEGE, CORK.

SCHOOLS OF ENGINEERING AND AGRICULTURE.

THE SESSION for 1850-51 will commence on the 15th of OCTOBER.

Prospectuses, with details of the several Courses of Lectures in connection with these Schools, the Fees payable, &c., may be obtained by application to the Registrar, or to the Professor of Engineering or Agriculture.

Boarding Houses, licensed by the President, have been established in Cork, where Students are received and comfortably provided for on moderate terms, and their religious and moral conduct watched over by the Deans of Residences.

By order of the President,
Aug. 17. FRANCIS ALBANI, Registrar.

The Agricultural Gazette.

SATURDAY, AUGUST 17, 1850.

MEETINGS FOR THE FOLLOWING WEEK.

THURSDAY, Aug. 22—Agricultural Imp. Society of Ireland.
THURSDAY, — 29—Agricultural Imp. Society of Ireland.

We have no doubt that Mr. PETER MATHEWS, of Cirencester, is a good representative of the English farmer, so far as hearty and good-natured energy in things general, and practical skill in things agricultural, are concerned—but we do not believe that he represents the general opinion of practical men on the usefulness of a wider range of knowledge in any business than the possession of mere skill implies. We do not believe that any body of intelligent men can be so blind to the difference between the truth itself and any individual attempt to realise it—between science and the efforts of scientific men—as this gentleman seems to be.

At a meeting in the neighbourhood of the Royal Agricultural College, last week, convened to do honour to himself, Mr. MATHEWS took occasion to criticise the general management of that institution. Now, no one will blame him for this, so long as he is actuated by anxiety for its improvement, not by a desire for its destruction: but instead of pointing out the errors which he believes to have been committed, and urging the necessity for their correction—instead of endeavouring to create a public opinion which should result in the improvement of an institution which might be of such great public value—he has spoken as if the failures, which he seems to have taken pleasure in recording, were the failures of science, and as if the idea of offering scientific education to the farmer were essentially and radically a mistake. "If things were not well done at the college no man of science could be expected to succeed"—and because some things have not been well done, science itself, we are left to infer, is to be found guilty of seeking credit among farmers upon false pretences—an inference which, we must believe, it was intended we should draw, because, amid the applause of the assembly, Mr. MATHEWS, after each particular failure he alleged, exhibited a contrast in the case of the neighbouring farmers, making the remark—"so here also *clay* beats *science*." The general impression, indeed, which this speech seems designed to convey, regarding the agricultural college, is that the institution is altogether impertinent to the real objects and interests of practical agriculture in this country, and that farmers may look at it merely as an impudent attempt to outshine themselves, and exhibit in them that ignorance of their business which the very establishment of such an institution is supposed to charge upon them. And by fostering such ideas as these, and encouraging the prejudice against "science" which undoubtedly exists among a certain class of agriculturists, we believe that Mr. MATHEWS has done just as much harm as his very considerable influence among his brother farmers and the occasion itself would permit. We are glad, however, to find that even in an assembly which seems to have heartily applauded his sentiments on these subjects, they did not go unquestioned, and that Mr. STEINKELLER, a Polish gentleman—a student at the college—rose to defend, not the errors which had been committed there, but, the principle on which the institution was founded, and on which he justly contended such institutions were desirable in every part of the country.

The speech we are discussing referred to two subjects—the pretensions of science in connection with agricultural education, and the management or mismanagement of Cirencester Agricultural College. On the first of these we cannot but imagine that Mr. MATHEWS overshot the mark at which he aimed. He must suppose some sort of education to be desirable for those who would follow his profession; and if so, we cannot believe that he would confine it to the communication of mere skill in farm operations. Surely he would not object to farm-pupils being taught the reasons, as well as the methods, of the operations they see; and unless he does this, he can have no case against a scientific education being offered to agricultural colleges. We submit that it would be a good thing for the progress of agricultural improvement if successful farmers, like Mr. MATHEWS, would refrain from encouraging a contempt for the "science of agriculture." Every one will admit, with them, that good practical farming is the only *result* of any utility to the country; every one knows that their experience (the gain of many years' successful prosecution of their business) is far more trustworthy, and, if people only *knew* it, would be worth far more than the experiments of one, two, or three years' duration, which solitary enthusiasts in the art have recorded for our instruction; every one must admit that the only true theory, or correct science, is that which finds its fulfilment in successful practice. Why, then, is not Mr. MATHEWS content with the undoubted superiority of his position, *as a farmer*, to that occupied by any chemist, or botanist, or amateur, who may desire to make an agricultural experiment? and why, calm in the possession of this undoubted superiority, can he not so far keep his temper, under the efforts at rivalry which some of the latter exhibit, as to avoid sarcastic allusions to the contest between "clay" and "science?" He may depend upon it that, on whichever side success in this contest appears, it is *there* that true science has been exhibited; for it is as the exponent, perhaps in some rare instances as the guide, but never as the rival, of successful farming, that the "science of agriculture" is to be regarded. It is not as a *result* of any material value, but only as means to such a result, that its advocates will defend an acquaintance with the theory of agriculture; and no intelligent practical farmer will join issue on such a plea as that. Whoever Mr. MATHEWS may ridicule, and with whatever success, for their attempts to illustrate or expound this theory, he cannot deny that there *is* a theory which embraces all his experience as a farmer, and the knowledge of which would be useful to an agricultural student; and just as the practice itself is to be taught by a practical farmer, so the theory which explains it is to be learned from the chemist, and geologist, and botanist.

So far, therefore, from laughing, with Mr. MATHEWS, at the scientific professors at the Agricultural College, because of the bad crops which he charges upon them; it is the *practical man*, whoever he may be, who had the management of them, whom, if the accusation be just, we should be disposed to blame. The other gentlemen taught, not farming, but chemistry and botany and natural history, sciences at which farmers may laugh if they please, but each of them, nevertheless, includes a body of *truth*, which, whether they know it or not, materially affects their practice, and an acquaintance with which, notwithstanding Mr. MATHEWS, we therefore recommend them to secure for their successors.

There may be much to blame in the present arrangements of the Royal Agricultural College, as an educational institution, but none of the faults it may exhibit can at all affect the soundness of the doctrine which teaches the advantage of a scientific education for agriculturists; and those who make use of them for the purpose of encouraging distrust of "science" by the farmer, do, in fact, *injure*, however they may please, those who feel it.

CONSTRUCTION AND VENTILATION OF STABLES.

THE advantage of applying to the various departments of the economy of living, the principles as indicated by science, is now fully recognised. Nevertheless, it is matter of some surprise that so little is done in the way of practical efforts to carry out these principles to a beneficial extent. Clearly as many understand the essential requisites to be attended to, for the due preservation of health; still, the manner in which they submit to the dangers and inconveniences resulting from the neglect of these, proves the wonderful apathy which possesses them; and if, with those who have knowledge, this is the case, what efforts can we expect those to make, who are thoroughly ignorant in all points of the subject? Much knowledge has lately been diffused relative to what is termed in the popular language of the day "sanitary reform," and people are now beginning to be alive to the importance of the truth, that the present system of "neglect and filth" is fraught with danger morally and socially to our best interests as a people. Long as we could dilate on this highly important subject, we are not here at liberty to do so; and would not have offered these remarks had they not been in some degree applicable to our subject. If it is true that our domestic structures have been "run up" heretofore, with no regard to the "comfort, cleanliness, and decency" of the inhabitants; it is equally true, that the same indifference as to structural arrangements has been manifested in the building of our stables and cow-houses. Disease has been allowed to run its "weary race," and to cut down unchecked its numerous victims; whereas by attention to healthy arrangements much of its virulence might have been mitigated, and the lives of many valuable animals saved. It is in vain to look for any satisfaction from buildings, however costly these may be, unless all care is taken to carry out the principles, and assist those natural laws, which are sent for wise and benevolent purposes. It is certainly true that in many stables and cow-houses more recently erected,

every attention has been paid to the health of the animals; but such unfortunately is the exception, not the rule; and, while hailing these improvements as steps in the right direction, we are at the same time anxious to see their benefits more widely spread—not confined to the wealthy landowner or farmer; we would wish to prove that they can be as easily and cheaply taken advantage of by the cottager and small farmer or stock keeper. This is in fact the design of our papers; our remarks shall be truly practical, and free, as much as possible, from all unnecessary elaboration. They are chiefly intended for those who are unwilling to procure professional assistance, either in the form of advice, or that derived from expensive books, but who are nevertheless anxious to obtain sound knowledge on the subject. This class we know is a numerous one, and the wants of which are worthy of being supplied, inasmuch as, we feel assured, they will avail themselves of the hints thrown out.

In the consideration of our subject, as indicated in the title, we shall first throw out a few "hints" relative to the laying out and placing of the drains, liquid manure tanks, &c.; thereafter offering our remarks and plans on the important subject of ventilation. In planning buildings adapted for the housing of cows, the first important matter to be attended to is the arrangements for conveying the liquid manure to proper receptacles in which it is to be retained till required for use. It is not necessary for us here to dwell on the importance of this point, supposing that the liquid excrement was of no value to the agriculturist or horticulturist; it is matter of great importance that it should, with a due regard to the animals' health, be at once removed, so as not to vitiate the air to which they are subjected. Before laying the floor it will be necessary to mark out the situation and direction of the drains. To do this properly the following should be considered the position of the stalls, and that of the receptacle to contain the manure. If the stalls are all on one side of the building, it will be necessary to have a drain leading from the front of these direct to the receptacle; if the stalls are on both sides of the house, drains should lead to a central sewer placed in the space between the two rows of stalls, which should be led in its turn direct to the receptacle. The most efficient and cheapest form of drain is that formed by circular earthenware pipes. Those made by Doulton, of St. Helen's, Lancashire, are cheap and most durable. At the bottom of each stall, or along the bottom line of stalls, an open drain should run; this will best catch the liquid manure if laid at least 2 inches below the level of the stall. This can be easiest formed of the common field drain tile, the open side being uppermost, and the circular imbedded in the clay, which should form the bottom of the trench cut for the drain. The joints of the different lengths should be carefully cemented with waterproof cement, so as to allow none of the liquid to permeate through the surrounding soils and thus be lost. The floor of the stalls should be sloping, and paved with flat broad stones, or asphalte would be better. The highest part of the slope should be at the head near the wall, the lowest near the drain; at the lowest part the edge should be nicely rounded, so as to allow the liquid to drop easily into the drain beneath; this may be effected by rounding the stones forming the floor with a chisel: if asphalte is used it will be very easily done. As the upper side of the drain will be left open, solid matter might find access thereto; to prevent this, a strip of perforated wood may be laid over it, or perforated tiles—the apertures will allow the liquid to have free access. It is not essentially necessary that this drain should be covered in, although it will add to the neatness and tidiness of the place—an important feature, by the way, which should not be overlooked. Supposing the receptacle for the manure to be at the end of the house, and that the slates run in a line with the length of it; the open drain should at once communicate with it. To facilitate the removal of the liquid, the drain should have a considerable slope or incline towards the receptacle; in a length of 20 feet this should be 18 inches, or say 1 inch perpendicular for every 18 inches length of pipe. At the point where the stalls terminate, the open drain should communicate with a circular stone-ware pipe, leading direct to the receptacle. If stalls are placed in both sides of the house, as we have before mentioned, the drains running before them should communicate with a central sewer. The open drain being made as above described, should have, at intervals along its length, say at the centre of each stall or place where the animal lies, sloping quickly down towards the central sewer, small circular stone-ware pipes. The joints should be made very tight—all kinds of joints are made ready for use—the "fawcet joint" is the best, and should be rammed up with good firm clay or Roman cement. The central sewer should slope quickly down towards the receptacle. If circular pipes are not used it should be remembered that it is essentially necessary, in order to obtain full satisfaction, that the drains however made should be round at bottom, smooth, having no false or open joints, and made with inclines or slopes towards the receptacle. We would however recommend the circular pipes to be used, they will be cheapest at the end. After the drains are laid the flooring should be attended to; it is of importance to have this smooth and clean. We by no means approve of the flooring generally used, the small round-headed stones are calculated to make the work of keeping the place clean a matter of no small trouble. The interstices between each collect straws and extraneous matter, which it is exceedingly difficult to remove; asphaltum or paved floor being smooth and uniform in surface is easily cleaned and washed. The floor of a well regulated shippen is, or ought to be, as clean as that of the kitchen of a dwelling house. The state of the interior of houses for animals is a test of the owners' good management. As asphalte and paving might be considered too expensive, we here give directions for making a firm floor very cheaply. The thickness of the floor should not be less than 2 feet; at the bottom place a layer of cinders from a smith's fire, the more vitrified they are the better—ram them down with a heavy rammer; the thickness of this should be 6 or 7 inches; above this place a layer of broken stones of a size sufficient to pass through a ring 2 inches in diameter; the thickness of the layer may be 2 or 3 inches. Procure some thin tough clay, in a liquid form, and pour this over the stones, so as to ram between them and bind them close together. Having at hand a supply of tough consistent clay (the blue kind is the best), lay it in lumps over the floor and ram them closely and evenly down; proceed in this way till the proper height is obtained, taking care to ram as hard as possible. To make the surface flat, take a board some 3 feet long and 2 broad, provided with a handle; beat the floor regularly with this, or pass a heavy roller over it. In the course of a few days the whole will become thoroughly hardened. This form of floor can be much improved by making the last layer of the clay rather soft, and imbedding firmly therein flat tiles; these should have sharp projecting knobs on their under side, which will sink in and embrace the clay—a fine hard level floor will thus be obtained.

The reservoirs into which the liquid excrement is to be led should be so constructed that none of the liquid be allowed to escape and permeate through the surrounding soil. The large central or side drain should not be taken at once, but led to a cesspool made at a level some feet below that of the floor of the stables, so that the adit of the drain shall be some 3 or 4 inches above the upper edge. The use of this cesspool is to catch and contain the solid matter, held in solution in the liquid exuvial, such being found to be the least valuable portion of the manure; moreover it is found to clog the valves used in the pipes, and used to deliver it from the tanks when required for use. The cesspool need not be large, and will be best constructed of wood, and carefully lined with gutta percha—a substance remarkably well adapted for such purposes. The joints are easily made water-tight by passing a hot iron carefully over them. A good proportion for the size of the cesspool will be one-tenth of the cubical contents of the tank or reservoir. The pipe leading to the tank should be placed within a few inches of the top, so that all overflow and waste may be prevented. The mode of constructing the tank may be seen in the following brief hints. An excavation is first to be made in the ground of sufficient dimensions; the best form is circular, the proportions being of greater diameter than depth. If the nature of the soil requires it, being loose or sandy, the bottom must be carefully puddled with firm blue clay. The bottom and sides must then be built over with brick, the sides carefully set in waterproof cement. Where a double lining of brick is deemed requisite, they should break joints, that is, the solid part of one brick should cover the joints of one beneath it. On the brick lining consolidating, a layer of waterproof cement should be applied on the outside, so that the whole may be perfectly water-tight. The cement should be mixed thoroughly with one-third part of coarse sharp sea sand. The covering of the tank may be arched, or a flat roof of timber used. Care should be taken to leave a hole provided with a cover to allow of a man to descend into the interior when required, also an aperture for the insertion of the pump barrel or pipe used for withdrawing its contents. Tanks may be made very cheaply by lining the inside of the excavation with tight boarding, and afterwards covering the interior with sheets of gutta percha, as above noticed. A tank thus made will last a long time. A corrugated zinc covering may be adopted in this case. If there is a large quantity of excrement produced, a second tank should be provided into which the overflow from the first may be led. Having thus very briefly drawn attention to the chief requisites to be attended to in stables (and cow houses) in connection with the drains, we shall, in accordance with our arrangement, proceed to the consideration of the important subject of ventilation. *B.*

STEAM POWER AND STEAM PLOUGHS.

I requested permission to make some remark on the past and present proceedings of the steam ploughman, but find it will lead me on to an examination of the present condition of our field mechanics in general.

I believe it is generally admitted that no human practice or calling whatever can be expected to maintain its ground against foreign or domestic rivalry, unless it possesses excellences of the highest order. I do not here more particularly allude to the fine arts, such as painting, poetry, and sculpture, or to the more learned and elaborate sciences, to which we know this rule is applied, than to a practice which depends upon mechanical manipulation as its governing principle; such a practice is agriculture, which may be said to consist in fracturing the soil, indenting, grooving (for seeds), and shaving the surface (for weeds, &c.) by mechanical means. The point upon which this inquiry will turn will be—1st, Whether tillage practice enjoys a mechanical movement of the highest order of excellence, such as we see exhibited when wood, iron, or similar hard material is mechanically operated upon; and, 2d, Whether the machines of tillage can be justly designated or assigned to be "machinery" at all, according to the common acceptation of that word. However, I shall proceed with the particular subject of this letter.

Since agriculture is ordered to stand its ground, dependent on its intrinsic merits alone, and to compete with all nations in conjunction with our other manufactures, I consider it desirable, for reasons hereafter adduced, that the economical agent, steam-power, as the prime mover to tillage and barn mechanism, should be introduced. That agriculture should enjoy the same economical and certain power which these other manufactures possess is not only fair, but absolutely requisite to insure success; my individual opinion being that to steam power, and to it alone, are those manufactures indebted for the maintenance of their position. I have examined them "up and down," right and left, and yet can discern no peculiar attribute capable of enabling them to occupy a position superior to that which farming ought to enjoy. There appears nothing superior in their proceedings which could insure greater stability in foreign competition, over agriculture, other than what they derive from the power—that power being the steam-engine. Withdraw every species of protecting advantage, but leave them *that*, and they hold their ground. Withdraw the steam-engine—give them every other advantage, yet these manufacturers would fall like a stone. If these things be true, it is perfectly legitimate to infer that the self-same agent which supports certain species of our manufactures, in like manner would support and maintain in its integrity another species of mechanical and chemical manufacture, called agriculture.

Thus it appears (unless I be contradicted and set aright by some one of your correspondents) that the possession of steam power is the mainstay to divers extensive British manufactures; and the inference therefrom is, that being acquired, it would perform the same service to another extensive manufacture, called agriculture. The only question remaining refers to the ways and means whereby it can be introduced with economy and effect.

For one, I am glad to see the Royal Agricultural Society has taken up the subject in earnest, and give it as my opinion, formed at the end of nearly four years' constant study of this particular subject, that it is of vital interest to the future welfare and prosperity of agriculture; and I trust that it never will be allowed again to sleep until the means whereby it can be added to our art be found out.

There have been divers attempts made to introduce steam power to field operating; it is termed "a problem of some 40 or 50 years' standing." It has been attempted to be introduced by what is termed "steam ploughing," that is to say, a locomotive steam-engine was made to draw a plough after the existing manner. But these attempts have always ended in failure; let us consider the causes likely to lead to this result.

The customary course of invention has been to make additions to farming mechanism. The first principles of the practice are assumed by the inventive mechanist to be perfectly correct. The idea in his mind is that the fundamental principles for mechanical manipulation in farm practice are settled and established on a sure and proved basis; that it is his duty to invent machines and cause them to "gear on" and adapt themselves to that which he assumes antiquity and long usage have established; forgetting that agriculture was invented in a non-mechanical age; overlooking that it was instituted at a period when the earth was believed by all to be a flat surface, somewhat like a Gloucester cheese; forgetting that the fashioner of the fields, and the forehorse to agricultural tillage machines, is the plough; an implement said to be "as old as Adam;" overlooking that it is not a piece of machinery at all, but simply a wedge, which, instead of being struck into the soil by a mallet, is impelled thereinto by a pair of horses. All these things he appears to overlook, and studies to add those things to the art which would "gear on;" in this he succeeded, and it was to be expected, for they were simply pieces of mechanism; but when he comes to try his hand at the adding a new power to the art, he is staggered and "dumb-founded," as they say, by finding the science of addition is brought to a dead stop; and no wonder, for the power he seeks to add is neither a horse nor an ox, nor an inanimate piece of mechanism, but an independent power, a specimen of still life, except when in action; he observes it will not gear on at all—that mere mechanical invention will not help him through the mystery—and thus his accustomed art is at an end.

Now a good and safe plan for the profitable exercise of the inventive faculties is that of striving to make additions only to those modes of proceeding which may exist in a mechanical practice; by a moderate exertion of ability an invention may be schemed and adapted to gear on with that which already exists; and if this aim be accomplished it is generally successful. The inventor takes care to shape his invention in the mould of the "now and the present," and it gains its position with but little difficulty, for this very good and excellent reason—it comes to its own and its own knows it! This answers well with pieces of mechanism; but when the question is that of the introduction of a new power—that order of art is at an end; a new power requires a new path and a new harness, the shafts no longer fit, and thus there is *prima facie* evidence exhibited to an inquiring mind, that the harness of the horse is unfit for that of the steam-engine.

I do not believe the science of invention is rightly understood by the generality of inventors—perhaps it is not designated a science at all; but considered as a gift or talent. And so it is an innate talent; but this is the very reason why a person who is born with a natural talent should possess or chalk out certain rules and laws for the guidance of his judgment; the imagination or ideality with which a person may be gifted requires not only restraint but government; a fertile imagination is like the light troops to an army—it goes forth to discover the enemy or difficulty, but as soon as it has discovered its office ends; and the battle must then be fought and won by the solid phalanx of the judgment; in other words, as soon as a person, by his assumed gifted imagination has made a discovery—instead of flying to the hammer and chisel, he should sit down, and with those rules before him which he has eliminated from and noted out of the book of a past and proved science, he should well consider the subject, for the purpose of eliciting the conditions upon which a successful issue to the event must depend. This is often to be obtained by discovering what are the distinguishing characteristics of the means he is about to employ.

Now let me show the application of such a rule as this to the important subject about to be brought under the consideration of the readers of the *Agricultural Gazette*. Suppose I wished to add steam power to agricultural mechanical operating? My object would be first to find out what were the characteristic principles of the elements I was about to call into action, because, like the chemist, I should expect known elements to develope their inherent properties.

The inquiry is—Agricultural machinery and the method of applying steam as the motive power thereto. The first characteristic I remark is, that the increased application of machinery calls more human beings into employment; this I note down as the characteristic feature of machinery in general. I next proceed to inquire into the peculiar properties of the power sought to be introduced; in our case this is steam power. What are its distinguishing characteristics? 1st, that it produces a maximum amount of effect by a minimum expenditure of power; 2dly, that it produces a maximum amount of profit by the expenditure of a minimum amount of material; 3dly, that (as a gentleman, who possesses the faculty of conveying a volume of thought in a few words, has said) "it refuses to waste itself;" which expressive metaphor, if I may be allowed to explain it more fully for our mutual instruction, implies that man has acquired a certain knowledge of what this power can accomplish, which (as I said before), is a maximum amount of effect by a minimum expenditure of power; so that when a man sees an operation like this going on, viz., a ponderous locomotive engaged in dragging a plough and a ploughman; his perception is instantly informed that the power is wasting itself as clearly and plainly as though the engine spake. He discerns that the result of this mode of proceeding is the production of a minimum amount of effect by the application of a maximum amount of power, and thence deduces that the power is erroneously applied. The fourth characteristic is, that the peculiar property of steam power is when introduced to double or treble the number of hands called into action by any manufacture, whether it be a cotton or a lucifer match manufacture. Now as this characteristic is of infinite concern, not only to the agriculturist, but to the nation at large, I beg to call your particular attention to it, because it will be clear to all, that if agriculture could but employ double or treble the number of human beings beyond what she now calls into direct action—the question of "no pauperism" is involved. This is a matter that concerns both the agriculturist, the statesman, and the philanthropist.

A cautious inventor having noted down these distinguishing characteristics, would then proceed with the solution of the problem by calling his given inventive faculties into action, for the purpose of producing a mechanical combination, which, being completed, should fulfil all the conditions. If by the exercise of his judgment he perceives these anticipated features gradually developing themselves as he proceeds with his combination of the power with the other means and materials, he is assured that he is on the right track; but if in the course of proceeding he perceives a discrepancy such as this, viz., that although he employs the power so as to produce the greatest amount of effect, yet it has no tendency to call the human hand into profitable employment; he knows directly that he is wrong, and that if he proceeded his machine might flourish for a time, but would then die, because an important characteristic condition was unfulfilled. A prudent inventor never passes a point of difficulty until he shall have fished out the cause and remedied it; it may require the meditation of months, yet he knows full well that the conditions involved being left unfulfilled, his invention would be imperfect, and have but a transient existence.

With these characteristics of machinery in general, and of steam power in particular, inscribed on strips of paper, which we will call "test papers," because they will perform the same office for us that the litmus paper does for the chemist, let us at once proceed to an analytical examination of the present mechanical practices of farming. We shall find the mechanism divided into two parts—that which is in use at the homestead, and that employed in the field. We will suppose it to be a farm of 300 acres of land, and whereon a steam-engine is used.

Let me request the company not only of the agriculturist, but of the machinist, as, in the course of examination, I may interrogate; it being understood that the ultimate aim of the investigation is to find out, and point out, "what is the specific impediment that forbids the banns between the steam-engine and the ploughshare." *C. B., Heacham, Norfolk.*

Home Correspondence.

Feeding Pigs.—Mr. Geo. Wilkins seems to have a Jewish horror of swine—"there is no profit," he says, "from keeping such quantities of disgusting pigs." I like pigs, myself, and never yet saw anything "disgusting" in these animals. This dislike may depend upon how they are managed, and the kind of breed. I will admit that a farmer may keep too many to be profitable; but this, again, depends upon management, whether they are a profit or loss. I have about 40, and soon hope to have 20 more. We have generally found them profitable, and our Wheat crops yearly increase by their agency. To fatten every pig born upon the premises is certainly not a wise system, nor to make baconers of all of them. Porkers of some, a few for bacon, some sold off as shoots a quarter old is the best plan. Selling the prime corn and fattening upon the tailing of Barley, Peas, and Beans is the more economical process. Besides, they are raised by the aid of Swedes, Mangold Wurzel, Tares, and also by a run out upon Clover or Grass, and this I find is a most economical method of keeping them. We reckoned all the pigs fattened this last year when corn was cheap yielded 20*s.* a sack for all corn consumed, when the market price for Barley was 12*s.* to 14*s.* per sack, Beans and Peas 15*s.* per sack. The quantity of valuable manure was very great, but I cannot put a price upon this, as the value is not tangible as to paying rent. The crops raised from this manure surpass all others, whether applied to cereal crops or roots of all kinds. Pray do not abuse our best friends, Mr. Wilkins; the rich and the poor find them equally profitable. *X. Y. Z., Hants.*

Judging of Implements at Glasgow.—As the decisions of judges at public exhibitions are at all times liable to be criticised by the public, I have no hesitation in pointing out what I consider an egregious error on the part of the judges of implements at the Glasgow show. In section 67, for the best apparatus for cutting the ends of drain pipes, there were two competitors; the one to which the premium was awarded had been exhibited two years previously, but it was rejected on account of its being an infringement of an existing patent, which was very proper. Now I want to know upon what grounds the judges gave their decision in its favour this year; if this apparatus was an infringement two years ago, is it not so still? It seems to me that the judges entirely overlooked their instructions, as contained in the schedules issued by the Society for their guidance. It there distinctly states that practical utility would be considered in preference to mechanical ingenuity; and "due weight will in all cases be given to economy, both as regards the price of the implement and the saving of labour effected by it." Keeping these instructions in view, I should be glad to know what practical utility or economy of labour is to be gained by the use of this apparatus? The pipes, after being made by the ordinary machine, are placed upon the shelves until they are somewhat dried; they are then taken to the apparatus, which must be firmly fixed to a table or something similar, where they are cut by it, not in quantities but individually, and only one end at a time; they have then to be replaced on the shelves, so that from the time that they issue forth from the machine used for shaping them until they are ready for the kilns, they are handled not less than five or six times. I am persuaded that one man cannot cut more than 1000 or 1500 per day. Taking these circumstances into consideration, coupled with the quantity that must necessarily be broken during the process, I am of opinion that no practical utility nor economy of labour is to be gained, rather the reverse. I believe that it has been attempted to work it by machinery, but it failed. That it will come into extensive use I do not believe. In making the above remarks for a moment believe. In making the above remarks it must not be supposed that I accord my approbation to the other machine exhibited; by no means—it has its faults, but which admit of easier remedy than the prize one. *One who has whistled at a Tile-machine.*

Law Agents and Land Agents is the heading of a paragraph in the *Agricultural Gazette* of a late week, under the signature of "N. P.," who commences by saying "I am a lawyer, and one also entrusted by landlords with the management of their estates." Its purport is to show that the remarks in your Leader of the 20th ult., condemnatory of the employment of lawyers and incompetent parties as land-agents, are "both illiberal and unfounded." When prices of agricultural produce were such that little skill on the part of tenants, and still less of practical ability in stewards, sufficed for the realisation and collection of rents, the qualifications of either for their respective duties were comparatively of no moment; but under the altered circumstances of the present day the capabilities of both will be regarded as of essential import to the interests of the landowner. As well might the cloth merchant of Leeds hope to compete with his west of England rival without the most approved appliances and skilful superintendence, as the English agriculturist with the foreign corn grower, unless by the application of those improved means which are now at his command. Your correspondent attempts to vindicate what he terms "the admixture of the solicitor's and the land-agent's business" by his own practice and his knowledge of that of others, stating that he himself makes no charge for law, and that his expeperience of both parties has shown him "that the education of the lawyer has for the most part better fitted him for placing the landlord in that position in which he ought to stand with a tenant." Now, I would ask "N. P." whether, defending as he does this admixture of the two professions in his own case, as a solicitor, he is prepared to show that such admixture in my case, as a land-agent, would be tolerated? Probably his knowledge of land and its requirements is about equal to my knowledge of law and its uncertainties. And touching education, although that of the lawyer is what the world calls liberal, the practice of doing everything from precedents tends very materially to limit that diversity of practical acquirements and observation which must be more or less needed in the successful management of estates. Had "N. P." favoured us by particularising what that position is in which a landlord ought to stand with a tenant, we might probably have better understood how the education of the lawyer is preferable. Let it not, however be supposed that I would detract from the qualifications of "N. P." in the slightest degree; on the contrary, I rather desire to afford him an opportunity, by the exercise of his twofold talents, of conferring a very great benefit on the landed and agricultural interest. The covenants and conditions of farm leases and agreements are confessedly most inappropriate to the more approved systems of husbandry now partially adopted, and daily becoming more general. Agreements binding a tenant, as most of them at present do, to cultivate his farm in one rotation of cropping, although it contains different descriptions and qualities of land, are too absurd to be much longer continued. May we then hope to see, in the pages of the *Agricultural Gazette*, draft copies of leases or agreements from the pen of "N. P." which shall be brief and comprehensive, and in all essential respects adapted to the requirements of the times. Let them be suited, for instance, to the most approved modes of cropping on three distinct formations—the magnesian limestone, the red sandstone, and the stronger clay soils of the coal and other districts. This done, an occasional article in your columns on wood and plantations, draining, and subsoiling, fold and artificial manures, surveying, levelling, and setting out of water meadows for irrigation (on which subject, by the way, there is much to be said and done), with the application of town sewage, would, I am sure, afford as much pleasure and advantage to the readers of the *Agricultural Gazette* as "N. P." has himself experienced from its perusal. Allow me, in conclusion, and in confirmation of at least one portion of your article of the 20th ult., to add that I can, of my own knowledge, adduce two instances of estate agency which come within the scope of your "illiberal and unfounded" remarks; the one, where the agent of an extensive and varied estate can neither read nor write; the other where the agent of a large property, capable of great improvement, is a most respectable solicitor, and has repeatedly told me that he knows nothing about land, and that lawyers have no business to be land-agents. *J. H. Charnock.*

The Cow Parsnip (Heracleum sphondylium).—Your correspondent "Scotia," who inquires about the Cow Parsnip, may find a very interesting paper on the subject in the "Journal d'Agriculture Pratique" for March, 1847. It is founded upon a communication addressed by our countryman Mr. Taunton, to M. Vilmorin, an eminent French agriculturist. In some parts of the Continent the value of the Heracleum as green food has long been known. Several varieties of it grow in great abundance in the best pasture land of the Alps, and the Swiss use it largely as food for their cows, highly prizing it for its milk-producing qualities. Should this opinion be well founded, then the size of the plant, when grown in a congenial soil, its abundant and substantial foliage, the rapidity of its reproduction when cut before it has seeded (some say that it will bear as many cuttings as Lucerne), would render it a truly valuable addition to our stall feeding resources. The plant was analysed by Sprengel more than 20 years ago, and was by him strongly recommended as useful fodder for cattle, and as worthy of being cultivated on a large scale. According to his analysis, 100 parts of the green plant contain 10.37 of solid nutritive matter, which in the dried plant would be equal to 72 per cent. *Wallia.*

[We should be very glad to accept the offer you kindly make.]

Societies.

ROYAL AGRICULTURAL SOCIETY OF ENGLAND.

A Weekly Council was held at the Society's House, in Hanover-square, on Wednesday, the 10th of July; present, Mr. Thos. Raymond Barker, V.P., in the chair, Hon. R. H. Clive, M.P., Hon. G. C. Agar, Sir Thos. Dyke Acland, Bt., M.P., Sir Montague Cholmeley, Bt., Sir Robert Price, Bt., M.P., Mr. Baines, Mr. Burke, Mr. Cail, Dr. Calvert, Mr. W. G. Cavendish, M.P., Mr. Clavering, Mr. Layton Cooke, Mr. Dyer, Mr. Miles, M.P., Mr. Milward, Mr. Ralph Neville, Mr. C. E. Overman, Mr. Parkins, Mr. Pendarves, M.P., Mr. Chandos Pole, Mr. P. Pusey, M.P., Prof. Sewell, Mr. Shaw, of London, General Shubrick, Prof. Simonds, and Mr. Spencer Stanhope.

The following new members were elected:

Barker, Edward, Mont-Vue House, Budleigh, Devon
Trench, Henry, Cangort-park, Roscrea, King's County
Pasmore, James, High-street, Exeter

Baker, Rev. Robert, Compton Basset, Wilts
Froom, W. J., North-street, Exeter
Smith, H., Trefusis, Devonport
Abergavenny, Earl of, Birling Manor, Maidstone, Kent
Bragg, William, Moreton-Hampstead, Devon
Fulford, Robert, Exeter
Ponsonby, Hon. C. F. Ashley Cooper, Hatherop Castle, Fairford, Gloucestershire
Southcomb, Rev. Edmund, Rose-Ash, South-Molton, Devon
Brown, John, Tring, Hertfordshire
Camp, James, Ilfracombe, Devon
Bacon, George P., Lewes, Sussex
Peel, William, Trevant-park, Looe, Cornwall
Cornish, Rev. R. P., Countess-Weir, Exeter.

The names of 18 candidates for election at the next meeting were then read.

Exeter Meeting.—The President transmitted a letter addressed to him by the Right Hon. Sir George Grey, her Majesty's principal Secretary of State for the Home Department, granting to the Society the Metropolitan Police Force required for "detective" purposes at the Exeter meeting.—Major Beir offered, on the part of M. Le Mesurier, of Guernsey, to place his bull of the Guernsey breed (to be exhibited at the Exeter meeting) at the disposal of the Society.—Messrs. Lucombe, Pince, and Co., expressed their intention of throwing open to the members their nursery grounds at Exeter during the meeting. These communications were received with the thanks of the Council.

Distribution of Manure.—Mr. John Martin, K. L., of Lindsey House, Chelsea, transmitted to the Council an interesting communication on the relative economy and advantages of the two systems of fluid and dry manure-distribution, which was received with thanks, and referred to the Journal Committee.

Drainage.—Mr. W. Bullock Webster transmitted a communication containing authentic documents connected with questions relating to deep and shallow drainage in strong clays; which was received with thanks, and referred to the Journal Committee.

Guano Adulteration.—Mr. Pusey, M.P., laid before the Council a statement of the increasing extent to which the adulteration of guano was taking place in London and other large towns along the coast. He also read to the Council a list of the unprincipled dealers, who were known to be connected with this nefarious system of plunder on the practical farmers of the country. Mr. Pusey, Mr. Miles, M.P., the Hon. R. H. Clive, and Mr. Parkins, favoured the Council with suggestions for the exposure and suppression of these dishonest practices.

Cottages and Hollow Bricks.—Mr. Roberts, of Connaught-square, presented to the Council a set of Revised Designs for Dwellings in Agricultural Districts, lately published by the Society for Improving the Condition of the Labouring Classes, with a specification and tabular statement of the quantities of materials required in executing six of the designs, best adapted to the ordinary circumstances of labourers. He also submitted to the Council a drawing and specimen of hollow bricks capable of being made with any good tile-machine, in the same manner as ordinary draining tiles, and at about the same cost, in proportion to the clay contained in them. He considered that the great advantages of dryness and warmth to be expected from the employment of hollow bricks, as well as of economy in construction, would render them peculiarly adapted for agricultural buildings, especially for farm-houses and labourers' dwellings, while their cheapness alone would recommend their use for enclosure and fence walls. He thought that all bricks prepared for these purposes should properly "bond" together and form substantial walls, without a medium being afforded for the conveyance of dampness from the exterior to the interior, in consequence of the heading courses and joints being carried through the wall. He considered also that the dimensions of the bricks ought have reference to the convenience of manufacture and cartage, facility for the operations of the workmen, and economy of mortar.—These presents and communications were received with the thanks of the Council.

Presents.—Mr. Willacy favoured the Council with further details of his employment of a hand-railway in his farming operations.—Mr. R. L. Allen, of New York, presented a copy of his "American Farm Book; or, Compendium of American Agriculture." Mr. Davis presented a coloured print of Lord Vernon's oxen and sheep. These presents were received with thanks; and the Council adjourned.

A Special Council was held at the Guildhall, Exeter, on Thursday, the 16th of July: present, the Marquis of Downshire, President, in the chair; Earl of Chichester, Viscount Hill, Hon. R. H. Clive, M.P., Hon. Dudley Pelham, M.P., Hon. H. W. Wilson, Sir Thos. Dyke Acland, Bart., M.P., Sir M. W. Ridley, Bart., Sir Charles Lemon, Bart., M.P., Sir Robert Price, Bart., M.P., Col. Austen, Mr. Raymond Barker, Mr. Bramston, M.P., Mr. Brandreth, Mr. Hamond, Mr. Fisher Hobbs, Mr. Miles, M.P., Mr. Milward, Mr. Shaw, of London, Mr. Sillifant, Mr. C. Hampden Turner, Mr. Turner, of Barton, Mr. Jonas Webb, and Mr. Wilson, of Stowlangtoft. The Right Worshipful the Mayor was introduced to the Council by Sir Thomas Acland; and Mr. Brutton, the Honorary Secretary to the Local Committee, by Mr. Sillifant, the Chairman. The business of this Council was entirely confined to questions connected with the immediate proceedings of the Country Meeting (toasts and speakers at the Pavilion dinner, admission of the representatives of the public press at the earliest hour into the show-yards, admission of the 140 Queen's scholars on Hele's foundation into the show-yards, questions on certificates of entry, and distribution of the duties of police).

The General Meeting of the Society was held in the Council Chamber, of the Guildhall, Exeter, on Friday, the 19th July, the Marquis of Downshire, President, in the chair.

The following resolutions were passed unanimously:

1. Thanks to the Mayor and Corporation of Exeter, for their zealous co-operation and essential aid in promoting the success of the Country Meeting then held in that ancient and loyal city.—Moved by Col. Challoner, of Portnall Park, Surrey; seconded by the Hon. R. H. Clive, of Oakley Park, Salop, M.P.

2. Thanks to Mr. Sillifant, of Combe, the chairman, and to the members of the local committee, for the admirable manner in which they had so kindly attended, by anticipation, to all the wishes and wants of the Society in connexion with the progress and holding of the Exeter meeting.—Moved by Mr. Shaw, of London; seconded by Mr. Fowlie, of Hursley.

3. Thanks to the owners and occupiers of sites of land, for the kind manner in which they had promoted the trials and exhibitions of the Society.—Moved by the Hon. Dudley Pelham, M.P., of St. Lawrence, Isle of Wight; seconded by Sir M. W. Ridley, Bart., of Blagdon, Northumberland.

4. Thanks to the committee of the Devon and Exeter Institution, for the liberal manner in which they had thrown open their museum and reading-room to the members of the Society.—Moved by Mr. C. Hampden Turner, of Rook's-nest, Surrey; seconded by Mr. Brandreth, of Houghton-house, Bedfordshire.

5. Thanks to the railway companies, for their concessions in favour of the exhibitors of the Society.—Moved by Mr. Pendarves, M.P., of Truro, Cornwall; seconded by Mr. John Tanner Davy, of Rose-Ash, Devon.

6. Thanks to Prof. Simonds, for his kindness in delivering a valuable lecture before the members on the occasion of the Exeter meeting.—Moved by Mr. Barugh Almack, of Albion-street, Hyde Park, London; seconded by Mr. W. Barrow Simonds, of St. Cross, Winchester.

7. Thanks to Sir Thomas Dyke Acland, Bart., M.P., of Killerton Park, and Mr. George Turner, of Barton, for the kind and liberal manner in which they had submitted their respective Water and Catch Meadows to the inspection of the members of the Society, and for the interesting explanations they had offered to them of their theory and construction.—Moved by Col. Challoner; seconded by the Hon. R. H. Clive, M.P.

8. Thanks to the Marquis of Downshire for the anxious attention he had given to the interests of the Society, and the able manner in which he had discharged the arduous duties of his office, in presiding over the various sittings connected with the business of the Society during the period of the Exeter meeting.—Moved by Col. Challoner; seconded by the Hon. H. W. Wilson, of Alexton Hall, Leicestershire.

Country Meeting.—The Hon. H. W. Wilson having enquired when it was considered that the Society's meeting terminated, he was informed that the "General Meeting," at which he was then present, and which was held by direction of the Royal Charter, occupied only a short half hour, and terminated on its rising at the expiration of that time; but that the "Country Meeting" of the Society, in its full, practical extent, was considered to engage an entire week—a period always referred to in the arrangements of the Society as the "Week of the Country Meeting."

A Special Council was held in the Council Chamber of the Guildhall, Exeter, on Friday, the 19th of July; present, the Hon. Robert Henry Clive, M.P., Trustee, in the Chair; Marquis of Downshire, Hon. Dudley Pelham, M.P., Hon. H. W. Wilson, Sir M. W. Ridley, Bart., Colonel Challoner, Mr. Shaw of London, Prof. Simonds, and Mr. C. Hampden Turner.

On the motion of the Marquis of Downshire, seconded by Mr. Shaw, of London, it was resolved unanimously, that the best thanks of the Council be conveyed to Mr. Brutton, of the Northernhay, Exeter, for the distinguished zeal and energy with which he had so kindly and efficiently promoted the objects of the Society, in the discharge of his duties as the honorary secretary to the Exeter local committee.

The Council directed a communication to be made to the authorities of Exeter, expressive of their high approbation of the conduct of the police force under the direction of Superintendent Steele; and a similar one to the Commissioners of Metropolitan Police, in reference to the conduct of the force under the direction of Inspector May, of the A division.

Thanks were ordered to Messrs. Tuxford and Sons, of Boston, and to Messrs. Barrett, Exall, and Andrewes, of Reading, for the kind manner in which they had so liberally placed their respective steam-engines at the disposal of the stewards, during the trials in the implement yard at Exeter, for 16 hours on each of the four days on which they had been required.

The Council ordered their thanks to be conveyed to M. Le Mesurier, for the kind intimation expressed to them on his part by Major Beir, that the Society should dispose, in any manner they thought proper, of his Guernsey bull, shown at the Exeter meeting; at the same time, however, stating that their arrangements did not admit of their availing themselves of his liberal offer.

A Monthly Council was held in the Society's House, in Hanover-square, on Wednesday, the 7th of August; present, the Earl of Chichester, V.P., in the chair, Hon. Dudley Pelham, M.P., Hon. H. W. Wilson, Sir Thomas Dyke Acland, Bart., M.P., Mr. Raymond Barker, Mr. Barnett, Mr. S. Bennett, Mr. Burke, Mr. W. G Cavendish, M.P., Colonel Challoner, Mr. Fisher Hobbs, Mr. Hudson, of Castleacre, Mr. Kinder, Prof. Sewell, Mr. Shaw, of London, Mr. Sillifant, Prof. Simonds, Prof. Way, and Mr. Jonas Webb.

The following new members were elected:

Gilbert, John Davies, Trelissick, Truro, Cornwall
Barrow, John Manson, Stoberry, Wells, Somerset
Bolitho, E., Penzance, Cornwall
Booker, Richard Blakemore, Velindra House, Cardiff, Glam.
Lushington, Charles Manners, Mansfield-street, Portland-place
Bolitho, T. S., Penzance, Cornwall
Milward, A., Upton House, Keynsham, Somerset
Case, John Bolton, Poulton-Hey, Bebbington, Birkenhead
Harmer, Fielding, South Cove, Wrentham, Suffolk
Ward, John, East Mersea, Colchester, Essex
Bush, George, Harley-place, Clifton, Bristol
Andover, Viscount, Suffolk House, Cheltenham
Pickering, John, 14, Whitehall-place, London
Yelverton, Hon. Wm. Henry, Whitland Abbey, St. Clears, Carmarthen
Hole, Henry, Ebberley House, Torrington, Devon
Plestow, Charles John Berners, Watlington-hall, Downham, Norfolk
Newman, Richard William, 24, Soho-square, London
Harris, James, Vivum, Barnstaple, Devon.

Finances.—Colonel Challoner, Chairman of the Finance Committee, laid before the Council the report of that committee on the accounts of the Society; from which it appeared that the current cash balance in the hands of the bankers (including 390*l.* received as life compositions, arrears of subscription paid up, and the special balance on the Exeter account), amounted to 3442*l.*—Colonel Challoner also laid on the table, for the information of the members, the quarterly statements of receipt, expenditure, and liabilities of the Society.

Miscellaneous Communications.—Master Goodridge, of Hele's School, Exeter, returned the thanks of himself and his schoolfellows, for the gratification afforded them by the Council in the free admission given them to the showyards of stock and implements at the Exeter meeting. Mr. Amos Bryant transmitted a communication on the cultivation of land. Mr. Graham reported his further researches into the origin and nature of the Potato disease. Mr. Moore, of Coleshill, reported the outbreak of disease among the Earl of Radnor's stock. The principal breeders of long-woolled sheep transmitted a memorial for the restoration of the Society's prizes in that class to their full amount. Prof. Way reported his conclusion of the investigation into the agricultural value of the Trinidad pitch-manure sent to the Society from the Earl of Dundonald, through the Rt. Hon. the Earl Grey. Notices of motion by the Hon. R. H. Clive, Mr. Shelley, Mr. Shaw, Col. Challoner, and Mr. Fisher Hobbs, in reference to questions connected with the Society's next country meeting. Letters from various parties on points connected with the Exeter exhibition. These communications were referred to the several departments to which they had reference.

On the motion of Mr. Raymond Barker, seconded by Mr. Jonas Webb, the usual vacations were granted to the secretary, and to the clerks of the Society, during the ensuing autumn recess. The Council then adjourned to Wednesday, the 6th of November.

Highland Society's Show at Glasgow.—The following is an abstract of the award of premiums:

CATTLE.

Short-horn Breed.—For the best bull of any age, the premium of 20*l.*, to Anthony L. Maynard, Marton-le-Moor, Ripon, York; for the second best, the premium of 15*l.*, to John Brodie, Abbey Mains, Haddington. For the best bull calved after the 1st January, 1848, the premium of 15*l.*, to S. Wiley, Brandsby, York. For the best bull calved after the 1st January, 1849, the premium of 10*l.*, to A. Cruickshank, Sittyton of Stralock, Aberdeen. For the best cow of any age, the premium of 15*l.*, to Richard Booth, Warlaby, Northallerton. For the second best, the premium of 10*l.*, to the same. For the best pair of heifers (in calf), calved after 1st January, 1848, the premium of 10*l.*, to Benjamin Wilson, Brawith, Thirsk. For the best pair of heifers calved after 1st Jan., 1849, the premium of 10*l.*, to James Gulland, Newtown of Wemyss, Kirkaldy.

Ayrshire Breed.—For the best bull of any age, the premium of 20*l.*, to James Andrew Greenwood; for the second best, the premium of 15*l.*, to Alexander W. Buttery, Monkland, Airdrie. For the best bull calved after 1st January, 1848, the premium of 10*l.*, to Robert Paton, Clober-hill. For the best bull calved 1st January, 1849, the premium of 5*l.* to Alex. W. Buttery, Monkland. For the best cow of any age, in milk, the premium of 15*l.*, to William Glasgow, Silverhill, Bothwell. For the best cow of any age (in calf), the premium of 10*l.*, to James Foster King, West Langhaugh. For the best pair of heifers, calved after 1st January, 1848, the premium of 10*l.*, to John Barry, Braidwood Meadow, Carluke. For the best pair of heifers, calved after 1st January, 1849, the premium of 8*l.*, to Nicol Somerville, Windales, Biggar.

Galloway Breed.—For the best bull of any age, the premium of 20*l.*, to Robert Gibbons, Mossband, Cumberland. For the best bull calved after 1st Jan., 1848, the premium of 10*l.*, to James Graham, Meikle Culloch. For the best bull calved after 1st Jan., 1849, the premium of 5*l*, to the same. For the best cow of any age, the premium of 10*l.*, to James Gillespie, Annanbank, Lockerbie. For the best pair of heifers, calved after 1st January, 1848, the premium of 10*l.*, to John Palmer, Hallflat, Carlisle. For the best pair of heifers calved after the 1st Jan., 1849, the premium of 8*l.*, to James Gillespie, Annanbank, Lockerbie. For the best pair of oxen calved after 1st Jan., 1847, the premium of 8*l.*, to Allan Pollok, yr., of Faside.

Polled Angus and Aberdeen Breed.—For the best bull of any age, the premium of 20*l.*, to William Fullarton, Airdovie Mains, Brechin. For the best bull calved after 1st Jan., 1848, the premium of 10*l.*, to Robert Scott, Balwyllo, Montrose. For the best bull calved after 1st Jan., 1849, the premium of 5*l.*, to Hugh Watson Keillor. For the best cow of any age, the premium of 10*l.*, to the same. For the best pair of heifers calved after 1st January, 1848, the premium of 10*l.*, to William M'Combie, Tillyfour. For the best pair of heifers calved after 1st Jan., 1849, the premium of 8*l.*, to Hugh Watson Keillor. For the best pair of oxen calved after 1st Jan., 1847, the premium of 8*l.*, to William M'Combie, Tillyfour.

Highland Breed.—For the best bull of any age, the premium of 20*l.* to Donald M'Donald, of Craigrue, Lochearnhead, Perthshire. For the best bull calved after 1st Jan., 1848, the premium of 10*l.*, to Duncan M'Naughtan, Cashley, Glenlyon. For the best bull calved after 1st Jan., 1849, the premium of 5*l.*, to Messrs. Stewart, Invermeran, Fortingal. For the best cow of any age, the premium of 10*l.*, to Neil Malcolm, of Poltalloch. For the best pair of heifers calved after 1st Jan., 1847, the premium of 10*l.*, to the Marquis of Breadalbane. For the best pair of heifers calved after 1st Jan., 1848, the premium of 8*l.*, to Donald M'Laren, Brae Leny, Callander. For the best pair of oxen calved after 1st Jan., 1846, the premium of 8*l.*, to Neill Malcolm, of Poltalloch.

HORSES.

For Agricultural Purposes.—For the best stallion, the premium of 30*l.*, to Robert Arkley, Philipstoun, Linlithgow. For the second best, the premium of 20*l.* to Andrew Leiper, Yardbent, Strathaven. For the best entire colt foaled after 1st Jan., 1847, the premium of 20*l.*, to Samuel Clark, Manswraes, Kilbarchan. For the best entire colt foaled after 1st Jan., 1848, the premium of 15*l.*, to Charles Philips, Cracrop, Brampton. For the best entire colt foaled after 1st Jan., 1849, the premium of 10*l.*, to John Wilson, jun., of Arden, Airdree. For the best mare, the premium of 15*l.*, to Alexander W. Buttery, Monkland. For the best filly foaled after 1st Jan., 1847, the premium of 10*l.*, to the same. For the best filly foaled after 1st

Jan., 1848, the premium of 8*l.*, to Robert Findlay, of Easterhill, Glasgow. For the best filly foaled after 1st Jan., 1849, the premium of 5*l.*, to David Fleming, Westhorn, Glasgow.

SHEEP.

Leicester Breed.—For the best tup, not exceeding 45 months old, the premium of 10*l.*, to Samuel Wiley, Brandsby, York. For the best pair of Dinmont or shearling tups, the premium of 10*l.*, to Samuel Wiley, Brandsby. For the best pen of five ewes, the premium of 8*l.*, to James Douglas, Athelstaneford, Haddington. For the best pen of five shearling ewes or gimmers, the premium of 5*l.*, to James Mitchell, Little Knox, Castle Douglas.

Cheviot Breed.—For the best tup not exceeding five months old, the premium of 10*l.*, to James Brydon, Moodlaw, Langholm. For the best pair of Dinmont or shearling tups, the premium of 10*l.*, to C. Borthwick, Hopsrig, Langholm. For the best pen of ewes lambed after 1st April, 1848, the premium of 5*l.*, to James Brydon, Moodlaw. For the best pen of five gimmers, lambed after 1st April, 1849, the premium of 5*l.*, to William Paterson, Twiglees, Lockerbie.

Black-faced Breed.—For the best tup not exceeding 45 months old, the premium of 10*l.*, to David Foyer, Knowhead, Lennoxtown, Stirling. For the best pair of Dinmont, or shearling tups, the premium, to the same. For the best pen of five ewes not exceeding eight months old, the premium of 8*l.*, to Malcolm Coburg, High Craigton, Kilpatrick. For the best pen of five young ewes lambed after 1st April, 1848, the premium of 5*l.*, to John Lorne Stewart. For the best pen of five gimmers, lambed after 1st April, 1849, the premium of 5*l.*, to James Brydon, Kinnelhead, Moffat.

Southdown Breed.—For the best tup not exceeding four years old, the premium of 10*l.*, to the Duke of Richmond, Gordon Castle. For the best pair of shearling tups, the premium of 10*l.*, to the same. For the best pen of five ewes, the premium of 8*l.*, to Hugh Watson, Keillor. For the best pen of five shearling ewes, the premium of 5*l.*, to Hugh Watson, Keillor.

SWINE.

For the best boar, large breed, the premium of 5*l.*, to George H. Plummer, Melville, Dalkeith. For the best boar, small breed, the premium of 5*l.*, to Jonathan Brown, Westward, Wigton, Cumberland. For the best sow, large breed, the premium of 4*l.*, to John Jardine, Reucastle, Helensburgh. For the best sow, small breed, the premium of 4*l.*, to Jonathan Brown, Westward, Wigton, Cumberland. For the best pen of three pigs, not exceeding eight months old, the premium of 4*l.*, to Thomas Bowman, Hallhill, Bailliestown, Glasgow.

Yorkshire Agricultural Society—At the Council Dinner of the Society, during its late meeting at Thirsk, the Duke of Leeds, President of the Society, took the chair. — Mr. Outhwaite opened the subject appointed for discussion, viz., "On the best and most economical Management of Live Stock during Winter, including the mode of feeding, housing, and general treatment." He said that what he was about to tell them would be from his own practice, and that which he had seen of other people, and which he had tested himself. The first part of the subject was with respect to horses; he did not mean race horses or hunters, but cart-horses, to work on their own farms. Now, up to the year 1845, his treatment was to give his horses hay and corn, and occasionally in the winter months straw; but in 1844, hay being scarce, he changed that practice. He then commenced cutting chaff. Many condemn the use of chopped straw, because they did not know how to manage it. He himself, like most new beginners, burnt his fingers, for he broke the wind of two horses from not managing the chaff properly. He thought the dust which accumulated in the chaff was highly injurious to horses. There was a great deal of dust about the machine, which he thought ought to be kept separate from the threshing-machine. The dust was bad for the constitution of the animal. Since he had adopted the precaution of keeping his chopping-machine from dust, he had never had any accident. He had always been very cautious in sifting the cut straw which the horses were to eat. Now, last Christmas he recommended to some of the leading makers of these chopping-machines to have a cylinder to sift out the dust after the straw was cut, because it would then be less injurious to the constitution of the horse. But there was another precaution to which he would allude. They were all aware, however clean the corn might be, or however well it might be got, the tail end of the sheaves would accumulate dust. His principle was this—before he got in the stack he cut off about an inch of the tail end of the straw, which was done at a small expense, as a man would do it all in about an hour and a half. With regard to cattle feeding, he had been in the habit of stall feeding a great many—that is, for a small farm on the average of years generally about 50, and sometimes as many as 70. There had been a great deal said about the treatment of these animals with respect to housing. He agreed that comfortable houses were an excellent thing, but it was a mistaken idea that good buildings would do everything for them, and that it was not necessary to pay great attention besides. There was no doubt a great difference of opinion as to how they should be fed. He had tried scientific stall feeding as nearly as possible, three or four tied up by the neck, and also in open sheds; but his opinion was, that with respect to the treatment of any description of animal in the winter season, the great thing was cleanliness and well ventilated houses. With regard to the benefit of ventilation, he had a proof of his own. Some eight or nine years ago it was necessary, by altering some buildings of his, to block up a doorway which gave a thorough draft through a house in which several young beasts were kept. After this door was blocked up there was not a sufficient draft of air, and he found that they did not thrive so well, although in other respects their treatment was the same. Many of them seemed delicate, and they got crooked and deformed, on account of the want of pure air. To remedy this he made a draft again, which answered very well, because since that the animals had done twice as well as before. His opinion was that thorough cleanliness and pure air were good for every description of animals, whether breeding or feeding. It was not merely that they should have a clean bed to lie down upon, but also a clean place to eat their meat from. The company themselves would not like to eat plum pudding from a plate on which they had just had roast beef. His system of stall feeding was to have the beasts tied by the neck, and to let his bullocks be loose. He gave them Turnips in the early part of the season, but the longer they were kept the better treatment they required. What he had been in the habit of doing was to use a great deal of ground corn or cake. For Beans and inferior corn there was not now, as they were aware, a good market, and the probability was that it was better to grind them up, and to turn them into beef and mutton. In 1849 he ground 1432 bushels of corn for cattle and pigs, but he never could prove whether the money laid out in that manner or in cake was the best. (Hear.) They were all aware that the profit was not entirely in the carcase of the animal, but that the manure also was a consideration. In considering the outlay for corn and cake they must not merely look to the overweight they might get and the advantage to the animal itself, but also to the proportion of manure they would obtain and the consequent benefit to the succeeding crops. He commenced with Turnips and cut straw, and gave his animals the last two or three months either cake or corn to the extent of 7 lbs. of Barley or Bean meal, or the same weight of oilcake, by which he derived the advantages he had just stated. He did not know that he could say any more on the subject of feeding cattle. All descriptions of animals required the same treatment; they did not all require corn or oilcake, but good treatment. It was most material, however, that they should pay considerable attention to the selection of animals. They must select such as had a tendency to get fat; some were of such a description that they could not be made fat, do what they would. Well, then, with regard to the treatment of sheep, he was of opinion that they did not shine in this part of the country—he did not mean the country about Thirsk, but in the North Riding. The reason of this was that in small farms, where no regular shepherd was kept, the sheep were not properly attended to. He believed that in January, or before the end of that month, the Turnips ought all to be cut for sheep, and put into troughs for them to feed from. On the wolds, where large sheep flocks were kept, this was the practice. As to hogs, they were aware that before March they began to get bad in their teeth, and to lose, in a short time, their condition they had been getting for months, because they are hungered. When a person had 100 sheep on Turnips it would pay to have one person to wait upon them, so that they might have good meat, particularly in the spring of the year. It was not so convenient to cut Turnips at Christmas as it was afterwards. Many might say that it was an inconvenience to cut Turnips in the time of storm, but that was no reason, because it was possible so to keep them as that they might easily be cut in stormy weather. He recommended them to be cut in every instance after January commenced. Many persons recommended the cutting of Turnips from the commencement, and he did not know but what they were right. —Mr. J. H. Charnock apologised for presenting himself to say anything on such a subject as this, but during the last six months he had seen one of the largest flocks of sheep in this county, and as it appeared to him there was some novelty about the method of treating them, he might be permitted to detail to them the mode of management pursued. The flock consisted of between 600 and 700 sheep, and were kept on magnesian limestone soil of Mr. Monckton Milnes, of Frystone. From the time of being bred they were fed with cake, consisting of an admixture of Rape and Linseed. When weaned they had given them one-third of Rape and two-thirds of Linseed cake, which they eat just as well as they would have done had it been all Linseed. He had himself this year seen 400 lambs weaned, the mothers of which were eating one-half Rape and the other half Linseed. The lambs were immediately put on cake in the proportion of one-third of Rape and two-thirds of Linseed, and not one of these lambs was lost in weaning time. This showed that an admixture of Rape with the Linseed cake appeared to be highly beneficial as regarded the health of the animal, whilst the same proportions of Rape and Linseed cake appeared to have answered just as well, not only as regarded the health but also as regarded the feeding of sheep, as if it had been all Linseed. The price of Rape cake, as they are all aware, was lower than that of Linseed, and therefore the use of it would be advantageous. In the Journal of the Royal Society, Mr. Pusey mentioned the use of Rape and Linseed cake in certain proportions, but this that he had mentioned was an instance of the use of Rape and Linseed cake on a rather large scale, and in the case he alluded to it had been most successfully used. Their secretary, Mr. Milburn, saw the last year's hogs before they went to market, and he could tell them that he did not often see such hogs. Many of them weighed 20 lbs. a quarter, whilst they would average 18 lbs. a quarter. He believed this to be a new feature in the feeding of sheep, and therefore he had taken the liberty of speaking to them upon it.—Mr. D. Milne, of Milne Graden, Berwickshire, in reference to the question of the chairman, as to whether any gentleman present could give an opinion of the mode in which Mr. Mechi feeds his stock during winter time, said he believed Mr. Mechi had published an account lately of the system he adopted. He had not had the advantage of seeing Mr. Mechi, but a few months ago he had the opportunity of visiting the farm of the Rev. Mr. Huxtable, who followed the system pursued by Mr. Mechi, with regard to feeding his stock upon split boards. If his Grace (the chairman) would allow him, he would state what the facts of the system were with regard to the economy of food. Happening to belong to the county of Berwick, in which there was a number of practical farmers who followed the ordinary system of feeding their cattle in sheds, he had the curiosity to compare the two systems together, and he requested some of his friends to weigh the food they gave to their cattle, and he requested Mr. Huxtable to do the same. One of his friends in Berwickkshire had 40 cattle feeding, and for 10 days he weighed 182 lbs. of Turnips daily to each. Mr. Huxtable also made the same experiment, and the result was, that the weight, not of Turnips, but of Mangold Wurzel, which he gave to each of his cattle, which were under cover and on spars, and were two years old, was 62 lbs., just one-third of the weight given by the Berwickshire farmers to each of their cattle fed in the way he had mentioned. Now, if these facts were true (which must be assumed to be the case, from the respectability of the parties who made the experiment), it seemed to bear out in a remarkable manner the principle which had been asserted to lay at the base of the two separate systems. The principle was this, that if they increased the temperature in which the animal was fed, they would be able to dispense with a certain quantity of food, and, moreover, if they used a more nutritious kind of food, and lessened the quantity, they would be able to economise that too.

Prizes of Implements.—The following prizes were awarded on Thursday morning: Plough at 5 inches deep, 1st prize of 5*l.*, to Mr. W. Busby, of Newton-le-Willows, Bedale; 2d, of 2*l.*, Mr. G. Meynell, of Northallerton. Plough at 7 inches deep, 1st, of 5*l.*, to Mr. R. Bincks, of Catterick; 2d, of 2*l.*, Mr. Busby. Plough at 9 inches deep, 1st, of 5*l.* to Mr. Busby; 2d, of 2*l.*, Mr. Binckes. Scarifier or cultivator, 1st, of 5*l.*, Messrs. Smith and Co., Stamford; 2d, of 3*l.*, Mr. W. Crosskill, of Beverley. Seed harrows, 1st, of 4*l.*, to Mr. Kirkwood, of Tranent; 2d, of 2*l.*, to Messrs. Howard and Son, of Bedford. Norwegian harrow, 1st, of 4*l.*, Mr. Crosskill; 2d, of 2*l.*, Mr. H. Kearsley, of Ripon. Subsoil plough, 1st, of 3*l.*, Messrs. Howard and Son; 2d, of 30*s.*, Mr. Kirkwood. Glover's paring plough, prize of 3*l.*, to Mr. John Palmer, Stockton-on-Tees. Lowcock's one-way plough, prize of 2*l.*, to Mr. J. Palmer. Potato-washer, prize of 10*s.*, to Mr. Crosskill. Wheels and axles, prize of 2*l.*, to Mr. Crosskill. Clod-crusher, prize of 2*l.*, to Mr. Crosskill. A mangle, prize of 1*l.*, to Mr. J. Demain, of Markington, Ripley. Turnip-drills, prize of 2*l.*, to Mr. J. Teasdale, Burniston, Bedale. Land-presser, prize of 10*s.*, to Mr. Ragg, Morton-on-Swale, Northallerton. Gardner's Turnip-cutter, prize of 1*l.*, to Mr. Kearsley. Threshing gear, prize of 5*l.*, to Messrs. Barrett, Exall, and Co., Reading. Cheese press, prize of 10*s.*, to Mr. G. Bolton, of Hinton, Catterick. Washing, wringing, and mangling machine, prize of 1*l.*, to Mr. B. Marsden, of Leeds. Whippletrees, prize of 10*s.*, to Messrs. Howard and Son. Sheep dipper, prize of 2*l.*, to Mr. Bigg, Southwark. Haymaker, prize of 3*l*, Messrs. Smith and Co. Safety-to-cutter, a medal, Messrs. Smith and Co. Horse hoe, prize of 1*l.* 10*s.* to Mr. W. Smith, of Kettering. Winnowing machine, prize of 5*l.*, to Mr. W. Smith. Rick stand, a medal, to Messrs. Hill and Co., Dudley. Granary crane and general assortment of hurdles, &c., prize of 3*l.*, to Messrs. Hill and Co. Garrett's horse hoe, prize of 4*l.*, to Mr. J. Palmer. Fire engine or pump, prize of 1*l.* to Messrs. Deane, Dray, and Co., London. Anthony's churn, prize of 10*s*, to Messrs. Deane, Dray, and Co. Cambridge's roller, prize of 1*l.*, to Mr. B. Stead, Gateforth, Selby. Wireworks, medal, Mr. Stephenson, of York. Garrett's drill, medal, Mr. Palmer. Hames and general assortment, prize of 1*l.*, to Mr. Palmer. Cottage ranges, prize of 1*l.*, Mr. Palmer. Draining tools, &c., price of 10*s.*, Mr. Palmer. Turnip cutter, prize of 10*s.*, Mr. Bennett, Liverpool. Steamer, prize of 30*s.*, Messrs. Richmond and Co., Salford, Manchester. Sack holder, prize of 10*s.*, Messrs. Richmond and Co. Hand cutter, prize of 2*l.*, Messrs. Richmond and Co. Collection of dog-carts, prize of 1*l.*, Messrs. Puckering and Houlgate, Beverley. Model of steam-engine, prize of 10*s.*, Mr. Hattersley. A single-horse cart, prize of 2*l.* Mr. Harland, Osbaldwick, York. Horse straw-cutter, prize of 4*l.*, Mr. Busby. Cake-breaker, prize of 1*l.*, Mr. Palmer. Horse-rake, prize of 2*l.*, Messrs. Howard and Son. Ridge scuffler, prize of 1*l.*, Mr. Busby. Ridge scuffler, improvement in expansion, a medal to Messrs. Hill and Co. Threshing machine, prize of 5*l.*, Messrs. R. and F. Grassby, Marton, Hull. Milk bowls, prize of 1*l.*, Messrs. Deane, Dray, and Co. Linseed mill, prize of 2*l.*, Mr. Palmer. Tile machine, prize of 2*l.*, Mr. R. Roger, Stockton-on-Tees. Gateheel, prize of 10*s.*, Mr. Roger. Stench trap, prize of 10*s.*, Mr. Roger. Steam engine, prize of 15*l.*, to Messrs. Clayton and Co., Lincoln, approved by Mr. Bourne.

Flax Improvement Society of Ireland, *July* 31.—In consequence of the successful working of the five establishments where Flax is now steeped on Schenck's hot water system, it was reported that many others were about to be erected. The sub-committee appointed to report on the trial of the strength and quality, for manufacturing purposes, of Flax steeped by this mode, stated that they had not yet received all the information requisite for a complete report; but they considered it of importance to bring forward several points at that meeting, in order to put the public in possession of the facts already ascertained, since considerable anxiety was manifested, by those about to embark in the steeping trade, to learn whether the reports as to the weakness of the Flax, and its difficulty to bleach, were founded on fact. A specimen of 140 lea weft yarn, made from the Flax, and of bleached lawn manufactured from it, were shown by Messrs. S. K. Mulholland and Hinds. The yarn was considered of average strength, and the lawn of good quality and colour. The bleachers stated that it was more easily bleached than if made of Flax steeped in the ordinary manner. Another specimen of boiled yarn, suitable for heavy linens, and made from the Flax, was shown by Messrs. Dunbar, M'Master, and Co, who were about to have it manufactured. It was very strong, and of a good colour. The chairman expressed his opinion in favour of the general merits of the system, founded on experiments carefully conducted by himself. He had tried the steeping at various temperatures, from 98 degrees to 65 degrees, the result of which he would report to the sub-committee. He considered the

strength and yield increased as the temperature was lowered. He was sure that the system, if carefully carried out, was likely to be of great benefit to the country at large. A letter was read from Mr. Marshall, of Leeds, communicating the details of his experiments on some Dutch Flax straw. Part was steeped in the usual manner, in Holland, and the rest of the lot was divided into two portions, one of which was steeped on the patent system, at Cregagh, County Down, and the other also on the patent system, at Patrington, Yorkshire. When each lot was scutched it was hackled, and the Dutch steeped gave 61 lbs. 1 oz. ; the Cregagh, 62 lbs. 4 oz. ; and the Patrington, 64 lbs. per cwt. The value of the first was 55*s.* 10*d.* per cwt. ; of the second, 63*s.* 10*d.* per cwt. ; and of the third, 74*s.* 10*d.* per cwt. The value per acre was, of the first, 9*l.* 8*s.* ; of the second, 10*l.* 14*s.* ; and of the third, 10*l.* 10*s.*, exclusive of the value of the seed. When made into thread the quality of all was good, and differed little in colour, solidity, and finish. Mr. Marshall considered this experiment very favourable to the patent steeping system. He recommended that several trials should be made, this year, at the different Irish steeping concerns, to ascertain the comparative value of the old and new modes, by the Society's agriculturists steeping one-half of a field of Flax in the usual steep-pools, the other half being steeped in the vats, and the result carefully noted in all the subsequent stages. The committee directed that this suggestion should be carried into effect at Newport, Ballina, Drimoleague, and Cregagh.

Miscellaneous.

Observations on the Freezing of the Albumen of Eggs.—The object of this paper is to illustrate a peculiar property of the albumen of the eggs of birds, a property which seems to have its purpose in preserving them from the injurious effects of very low temperatures. Mr. Hunter observed that a fresh egg will resist freezing longer than one which has been previously frozen and thawed ; and he referred this fact to the "vital power" of the egg in the first case, and the destruction of that power by freezing in the second. The author's experiments confirm those of Mr. Hunter, and prove, also, that when fresh eggs are exposed to very low temperatures, and also in the case of eggs which are decayed, or putrid, or the contents of which have been much altered by mechanical force or by electricity, a shorter time is sufficient for the freezing of such eggs, than is necessary for the freezing of those which are uninjured. An examination of the rates at which heat was lost by the several eggs, exposed to temperatures varying from zero to 10° Fahr., showed that fresh eggs, though they resist freezing longer than any others, yet lose heat more quickly ; and that their resistance to freezing is due to the peculiar property of their albumen, the temperature of which may be reduced to 16° Fahr., or much lower without freezing, although its proper freezing-point is at or just below 32°. Other than fresh eggs lose heat comparatively slowly, but freeze as soon as their temperature is reduced to 32° ; fresh eggs lose heat more quickly, but may be reduced to 16° or lower ; then, at the instant of beginning to freeze, their temperature rises to 32°. That this peculiarity of fresh eggs is not due to vital properties, is proved by experiments which show that certain injuries, such as mechanical violence, addition of water, and others, which spoil their powers of resisting freezing, do not prevent eggs from being developed in incubation. By the same and other experiments, which are related, it is made probable that the peculiarity depends on the mechanical properties of the albumen ; for, whatever makes the albumen more liquid than it is naturally in the fresh egg, destroys the power of resisting freezing. The author could find no other substance possessing this property ; and in evidence of its adaptation to the purpose of preserving eggs from the loss of their capacity of development, which they would suffer in being frozen, he relates experiments in which eggs were kept for a considerable time at temperatures ranging from zero to 10° Fahr., yet were afterwards developed in incubation. By the same series of experiments it was shown, that, although freezing renders the effectual development of the germ impossible, yet the intensest cold, if freezing does not take place, has no similar result. *Prof. Paget in the Chemical Gazette.*

Mr. Mechi's Farm.—On Tuesday, the 23d ult., several hundred gentlemen assembled at Tiptree Hall Farm, to pay Mr. Mechi a visit of inspection. They came from every part of the country, and were in all respects fit people for such an occasion. There were large farmers, intelligent land agents, and enterprising liberal proprietors. The Church was worthily represented by the presence of half-a-dozen clergymen, and Messrs. Ransome and May, of Ipswich, and Mr. Croskill, of Beverley, were there to see that the farm implements were what they should be. With a long train of curious and interested agriculturists, Mr. Mechi visited every field on his farm, sometimes skirting along the headlands, sometimes dashing through the centre by the help of a water furrow, and still the concourse poured on their way, and listened to the animated explanations which their enquiries drew forth. Often amidst the tall crops of Wheat, their heads alone visible over the waving mass, were knots formed and rapid discussions carried on, with reference to matters of practical detail. At one moment the virtues of box manure were discussed ; then the expediency of growing Wheat oftener than by the present systems of cropping ; then the merits of thin sowing ; then the efficacy of thorough draining on stiff clay ; then the proper method of securing deep disintegration and a fine tilth. On all these topics the changes of conversation rung ; and, amidst them all, ran an under-current of commentary and calculation on the amount of produce which each field would yield. It was confessed on all hands that the Wheat crops were splendid ones. For the last six years Mr. Mechi has grown Wheat alternately with green crops every second year, and he expects, as the result of the present harvest, a return of 5 quarters to the acre. His show of Beans, Potatoes, Clover, Mangold Wurzel, and Turnips was also very creditable to him. On the second-mentioned crop he took occasion to point out its remunerative character, and the prejudices which existed against it, while, with reference to the last, he dilated, as the result of his experience, on the virtues of superphosphate as a manure. Mr. Mechi has a hearty contempt for the fallowing system which prevails so extensively in Essex, and especially in the district called the Roothings. His idea is, that the land should be deeply stirred, kept thoroughly clean, and be maintained in constant and high cultivation. *Times.*

Notices to Correspondents.

BONE-DUST : *A Subscriber.* We believe that 16 to 20 bushels per acre of rough bone-dust is the quantity Lord Ducie applies.

BONES : *A G.* Mr. Blackhall's steaming process will prepare them for the action of acid, which may be added immediately. We do not know what length or heat of steaming is needed.

BOOKS : *Country Curate.* There is a shilling book on pigs by Mr. Richardson.

CLOVER : *Gallovidian.* It is Cow-grass, we believe.

COUGH : *J H.* A seton near the seat of irritation is more likely to be useful than anything else. *W. C. S.*

DISEASE IN THE TAIL : *A Little Farmer.* A blister applied to the loins will probably be of service. The common blistering ointment may be rubbed in. *W. C. S.*

DRAINING COMPANY : *Vicar.* We understand that it is actually in existence. It will no doubt advertise shortly. Mr. Bailey Denton is, we understand, one of its officers.

FERNS : *A B.* If you always cut it down or pull it up as soon as there is anything strong enough to hold on by, it will ultimately disappear.

REDWATER : *Lifton.* It is a disease of the digestive organs (principally of the liver) and is frequently caused by a sudden change of pasturage. The proper treatment consists in the administration of active purgative medicine, combined with stimulants, and followed by diuretics. *W. C. S.*

STEAMING APPARATUS : *Devizes.* Apply to Richmond and Chandler, Salford.

Markets.

COVENT GARDEN, Aug. 17.

Vegetables are abundantly supplied ; Hothouse Grapes and Pine-apples plentiful. The supply of Peaches and Nectarines is well kept up. Ripe Gooseberries fetch from 2s. 6d to 3s. 6d. per half sieve. Oranges and Lemons though scarcer are sufficient for the demand. West Indian Pine-apples are plentiful, and large quantities of Plums and Pears are received three times a week from the Continent. Filberts are coming in very plentifully, and owing to the large supply of foreign ones in the market, they sell heavily at 30s. to 35s. per 100 lbs. Carrots and Turnips may be had at from 3d. to 6d. a bunch. Potatoes are plentiful and cheap. Lettuces and other salading are sufficient for the demand, and so are Mushrooms. French Beans are scarcer. Cut Flowers consist of Heaths, Pelargoniums, Lily of the Valley, Carnations, Picotees, and Roses.

FRUITS.

Pine-apples, per lb., 4s to 6s	Apples, dessert, p. bush, 4s to 8s
Grapes, hothouse, p. lb., 2s to 5s	— kitchen, do., 1s 6d to 3s 6d
Peaches, per doz., 4s to 15s	Lemons, per doz., 1s to 3s
Nectarines, per doz., 4s to 15s	Oranges, per doz., 2s to 3s
Apricots, per doz., 1s 6d to 5s	— per 100, 8s to 24s
Cherries, per lb., 1s to 1s 6d	Almonds, per peck, 6s
Melons, each, 2s to 4s	— sweet, per lb., 2s to 3s
Gooseberries, per half sieve, 2s 6d to 3s 6d	Walnuts, p. 100, 1s 6d to 2s
Currants, p. half sieve, 3s to 4s	— p. bush., 16s to 24s
Raspberries, p. pottle, 4d to 6d	Nuts, Barcelona, per bush., 20s to 22s
Plums, p. punnet, 1s to 1s 6d	— Brazil, p. bsh., 12s
Green-gages, do., 1s to 2s	

VEGETABLES.

French Beans, p. sieve, 3s to 4s	Shallots, per lb., 6d to 8d
Cabbages, per doz., 6d to 1s	Garlic, per lb., 4d to 8d
Cauliflowers, p. doz., 2s to 4s	Artichokes, p. doz., 2s 6d to 3s
Peas, per sieve, 3s to 6s	Vegetable Marrows, per doz., 6d to 1s
Beans, per sieve, 1s 6d to 2s	Lettuce, Cab., p. sc., 2d to 1s
Sorrel, p. hf. sieve, 6d to 9d	— Cos, p. score, 6d to 1s 6d
Potatoes, per ton, 50s to 80s	Radishes, p. 12 hands, 9d to 1s
— per cwt., 2s 6d to 4s	Small Salads, p. punn, 2d to 3d
— per bush., 1s 6d to 3s	Horse Radish, p. bdl., 1s to 4s
Turnips, per doz. bun., 2s 6d to 3s 6d	Mushrooms, p. pot., 9d to 2s
Red Beet, per doz., 1s to 2s	Fennel, per bunch, 2d to 3d

Old Clover	78 84		

SMITHFIELD, MONDAY, Aug. 12.

The supply of Beasts is large, but the average quality inferior ; choice ones are consequently pretty readily sold. The number of Sheep is also large ; the demand is good, and late prices well supported. Trade is slow for Calves at Friday's quotations. From Holland and Germany there are 887 Beasts, 3820 Sheep, 185 Calves, and 44 Pigs ; from Scotland, 200 Beasts ; from Norfolk and Suffolk, 250 ; and 2500 from the northern and midland counties.

Per st. of 8 lbs.—	s	d	s	d
Best Scots, Herefords, &c. ...	3	6 to 3	8	
Best Short-horns	3	4 — 3	6	
2d quality Beasts	2	8 — 3	2	
Best Downs and Half-breds	—	...		
Ditto Shorn ...	4	0 — 4	2	

Per st. of 8 lbs.—	s	d	s	d
Best Long-wools		to	...	
Ditto Shorn ...	3	4 — 3	8	
Ewes & 2d quality ...	—	—	...	
Ditto Shorn ...	3	0 — 3	4	
Lambs	4	0 — 4	8	
Calves	2	8 — 3	8	
Pigs	3	0 — 4	0	

Beasts, 4129 ; Sheep and Lambs, 31,920 ; Calves, 288 ; Pigs, 205.

FRIDAY, Aug. 16.

The number of Beasts exceeds the demand, and our top quotations are with difficulty realised for the choicest. The supply of Sheep is considerable, but a large proportion of inferior quality ; consequently, the best descriptions support Monday's prices ; other kinds are lower. There is a demand for good Lambs, but middling ones are very unsaleable. Calves are more in request, at an advance of about 2d. per 8 lbs. From Germany and Holland there are 366 Beasts, 2690 Sheep, and 305 Calves ; from Scotland, 80 Beasts ; 250 from the Midland counties ; and 102 Milch Cows from the home counties.

Per st. of 8 lbs.—	s	d	s	d

MARK LANE.

MONDAY, Aug. 12.—The supply of English Wheat to this morning's market was moderate, including a few samples of new white, which were disposed of at 48s. to 52s. per qr., quality thin and variable, none fine ; in the old or foreign we observe no alteration in price, and the demand continues restricted to retail necessitous buyers.—Barley is inquired after, at fully last week's quotations.—The value of Beans and Peas is unaltered. There were a few new Peas at market, quality generally small and poor ; grey, 27s. to 28s. per qr. ; fine white made 31s. per qr.—The Oat trade is heavy, and late rates with difficulty maintained.

FRIDAY, Aug. 16.—We have been fairly supplied with foreign and English Wheat during the week, but the market both on Wednesday and to-day was thinly attended, and but a moderate business was transacted on Monday's terms.—Barley and Oats meet with buyers at late prices.—In the value of Beans and Peas there is no alteration.—Flour is held firmly at former prices, but the demand is less active. — Floating cargoes of Galatz Maize are held at 29s., cost, freight, and insurance.—Although occasional heavy rains have been partial during the week, we do not hear of the crops having suffered materially from them ; harvesting has commenced pretty generally, and we have strong grounds for believing that the yield of Wheat will be under an average, some most important districts having suffered considerably from mildew, and the ears generally being more or less defective.

LIVERPOOL, FRIDAY, AUG. 9—Much rain has fallen yesterday and to-day, and more tone was imparted to our corn market this morning. Holders of Wheat demanded a small advance, but buyers operated very cautiously, and the business effected was at fully Tuesday's rates. Flour was in good demand, and quite as dear. Beans and Peas were each 6d. per qr. dearer. Barley and Oats commanded extreme prices. There was no change in the value of Indian Corn, and it was in fair request for Ireland. Arrivals into Liverpool from July 6 to Aug. 8 : Wheat, 6308 qrs. ; Malt, 344 qrs. ; Oats, 2134 ; Indian Corn, 7954 qrs. ; Oatmeal, 297 sacks ; Flour, 1545 sacks. Exports to Ireland : Wheat, 188 qrs. ; Peas, 33 qrs. ; Indian Corn, 2106 qrs. ; Indian Corn Meal, 71 brls. ; Flour, 408 sacks, 1058 brls. ——TUESDAY, AUG. 13. There is a little increase this week in the arrivals of Wheat, Oats, Oatmeal, and Flour from Ireland, but the importations from abroad are upon a smaller scale than of late, though still tolerably liberal. Our market was pretty well attended by millers and dealers. As regards Wheat, the buoyant speculative feeling of Friday disappeared, but we were compensated by a steady demand for consumption, at much the same prices as ruled on Tuesday last. Flour commanded full prices, and French gains favour. Old Oats moved slowly ; a small lot of Irish new sold at 2s. 8½d. per 45 lbs. Barley, Beans, and Peas fully sustained late rates. There was a fair inquiry for Indian Corn, but being firmly held for full prices the actual business was small. Present prices : Wheat, English red, per 70 lbs., 5s. 10d. to 6s. 4d. ; white, 6s. 1d. to 6s. 7d. Barley, Scotch and Irish, per 60 lbs., 2s. 10d. to 3s. 1d. Malt, English, per qr. pale, 48s. to 52s. Oats, English and Scotch, per 45 lbs., 2s. 8d. to 2s. 10d. Beans, English, per qr., 28s. to 32s. Peas, do. do., 27s. to 30s.

Popular Works

PRINTED FOR

TAYLOR, WALTON, AND MABERLY,

BOOKSELLERS AND PUBLISHERS TO UNIVERSITY COLLEGE,
28, UPPER GOWER-STREET, AND 27, IVY LANE, PATERNOSTER ROW, LONDON.

DARLEY'S SCIENTIFIC LIBRARY

FOR THE USE OF
SCHOOLS, PRIVATE STUDENTS, ARTISTS, AND MECHANICS.

IT is the purpose of this Work to furnish a Series of Elementary Treatises on Mathematical Science, adapted to the wants of the public at large. To youth of either sex at public and private schools; to persons whose education has been neglected, or whose attention has not been directed in early life to such studies; and to Artists and Mechanics these little works will be particularly suited. The principles of the various Sciences are rendered as familiar and brought as near to our commonest ideas as possible; the demonstrations of propositions are made plain for the mind and brief for the memory, and the Elements of each Science are reduced not only to their simplest but to their shortest form.

I.
A NEW EDITION (being the fifth) *is now ready,*

A SYSTEM OF POPULAR GEOMETRY;

Containing in a few Lessons so much of the Elements of Euclid as is necessary and sufficient for a right understanding of every Art and Science in its leading truths and great principles.
By GEORGE DARLEY, A.B.
Price 4*s.* 6*d.*, cloth.

II.
NEW EDITION (just published),

COMPANION TO THE POPULAR GEOMETRY;

In which the Elements of Abstract Science are familiarised, illustrated, and rendered practically useful to the various purposes of life, with numerous Cuts.
By GEORGE DARLEY, A.B.
Price 4*s.* 6*d.*, cloth.

III.
THIRD EDITION,

A SYSTEM OF POPULAR ALGEBRA;

WITH
A Section on PROPORTIONS and PROGRESSIONS.
By GEORGE DARLEY, A.B.
Price 4*s.* 6*d.*
"For Students who only seek this limited knowledge of these sciences, there are, perhaps, no treatises which can be read with more advantage than 'Darley's Popular Geometry an Algebra.'"—*Library of Useful Knowledge, article "Mechanics."*

IV.
SECOND EDITION,

A SYSTEM OF POPULAR TRIGONOMETRY,

Both Plane and Spherical.
With POPULAR TREATISES on LOGARITHMS, and the Application of Algebra to Geometry.
By GEORGE DARLEY, A.B.
Price 3*s.* 6*d.*, cloth.

V.

FAMILIAR ASTRONOMY.

By GEORGE DARLEY, A.B.
WITH ENGRAVINGS.—12mo, 5*s.*, cloth lettered.
"There is a vast deal of astronomical information conveyed in a most winning and unassuming manner in this delightful little volume, which not less for the novelty of its plan than the extent of its intelligence, reflects infinite credit on the taste and talents of its projector and editor, Mr. Darley."—*Sun.*

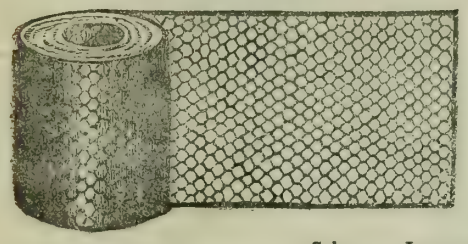
NEWS, NEWS, NEWS.—The best, cheapest, and largest Newspaper in the World.—LLOYD'S WEEKLY LONDON NEWSPAPER contains 60 large columns of the latest intelligence from all parts of the Globe, price only Threepence, postage free. Send Three Postage Stamps to E. LLOYD, 12, Salisbury-square, London, and receive one copy as a sample.

HOLLOWAY'S PILLS A CERTAIN CURE FOR HEADACHES, BILE, LOSS OF APPETITE, AND LOWNESS OF SPIRITS.—These invaluable Pills can be taken without damage from wet or cold, requiring no restraint from business or pleasure. They act mildly on the Bowels, without pain or griping, strengthen the Stomach, and promote a healthy action of the Liver, whereby they purify the Blood, cleanse the Skin, brace the Nerves, and invigorate the whole system. They prove an admirable remedy also for those who suffer from a debilitated constitution, as they create an appetite, correct indigestion, remove bile, giddiness, nervous or sick headaches, and palpitation of the heart.—Sold by all Druggists, and at Prof. HOLLOWAY'S Establishment, 244, Strand, London.

IMPORTANT INFORMATION.

DR. ROBERTS'S celebrated OINTMENT called the POOR MAN'S FRIEND, is confidently recommended to the Public as an unfailing remedy for wounds of every description, a certain cure for ulcerated sore legs (if of 20 years' standing), cuts, burns, scalds, bruises, chilblains, scorbutic eruptions and pimples in the face, sore and inflamed eyes, sore heads, sore breasts, piles, fistula, and cancerous humours, and is a specific for those afflicting eruptions that sometimes follow vaccination. Sold in pots at 1*s.* 1½*d.* and 2*s.* 9*d.* each. Also his PILULÆ ANTI-SCROPHULÆ; confirmed, by more than 40 years' experience, to be without exception one of the best alterative medicines ever compounded for purifying the blood and assisting Nature in all her operations: hence they are useful in scrofula, scorbutic complaints, glandular swellings (particularly those of the neck, &c.) They form a mild and superior family aperient, that may be taken at all times without confinement or change of diet. Sold in boxes at 1*s.* 1½*d.*, 2*s.* 9*d.*, 4*s.* 6*d.*, 11*s.*, and 22*s.* each.—Sold wholesale by the proprietors, BEACH and BARNICOTT, at their Dispensary, Bridport, and by the London Houses; and retail, by all respectable Medicine Vendors in the United Kingdom.

WIRE NETTING, ONE PENNY PER SQUARE FOOT.



GALVANISED WIRE NETTING, TWO-PENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.

12	inches	wide	3d.	per yard.	30	inches	wide	7½d.	per yard.
18	"	"	4½d.	"	36	"	"	9d.	"
14	"	"	6d.	"	48	"	"	1s.	"

Galvanised do., 1d. per foot extra.

Extra strong Imperial Wire Sheep Netting, 3 feet, 1s. 6d. per running yard; if galvanised, 2s. Also every description of Wire Nursery and Fireguards. Wire House-lanterns and Shades, Fly-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1s. 10d. per square foot, with bolts complete, in mahogany frames; Gothic Garden Bordering, 6d. per running foot; Flower Trainers, from 3d. each; Garden Arches, 20s. each; Flower Stands, from 3s. 9d. each; Galvanised Tying Wire for plants and trees, Dahlia Rods, and every description of Wire-work; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of Thomas Henry Fox, 44, Skinner-street, Snow-hill, London.

GALVANISED WIRE GAME NETTING.—7d. per yard, 2 feet wide.

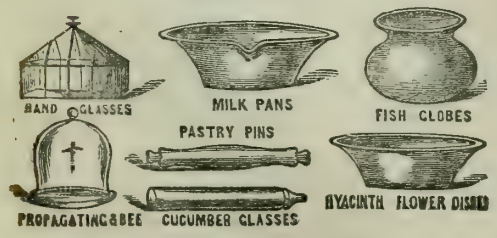
	Galvanised.	Japanned Iron.
2-inch mesh, light, 24-inch wide ...	7d. per yd.	5d. per yd.
2-inch " strong " ...	9 "	6½ "
2-inch " extra strong " ...	12 "	9 "
1⅝-inch " light " ...	8 "	6 "
1⅝-inch " strong " ...	10 "	8 "
1⅝-inch " extra strong " ...	14 "	11 "

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3d. per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

FARMS WANTED AT MICHAELMAS NEXT.

MR. HURLEY, Farm Agent and Auctioneer, is instructed to obtain a really good Farm, from 200 to 600 acres, suitable to the growth of Turnips, Barley, &c., with good Farm Residence and Buildings (if near London, preferred). Also, a small Farm, from 70 to 150 acres, of good Meadow and Arable Land, Farm-house, and Homestead.—Full particulars to be sent prepared to Mr. Hurley, Offices, 62, Nelson-square, London. Parties having the above description of property, estates, houses (furnished or unfurnished), or professions of any kind for sale or to let, are solicited to forward particulars to Mr. Hurley for insertion upon his Register, for which no charge is made, unless a treaty is effected. Those requiring such, are requested to inspect the same.



SURREY—FARM TO BE LET, WITH IMMEDIATE POSSESSION.

MR. HURLEY, Land Agent, has to Let an excellent FARM, with suitable House and Buildings, and upwards of 100 acres of good sound Turnip and Barley Land, with some Meadow.—For particulars, apply (inclosing two stamps), to the Auctioneer, 62, Nelson-square, London.

FARMS TO BE LET.

MR. HURLEY, Surveyor and Farm Agent, is favoured with the letting of six excellent ARABLE and MEADOW FARMS, in the counties of Surrey, Cambs, Sussex, and Kent, averaging from 200 to 400 Acres. Rents very moderate to meet the times. Good residences, and farm buildings. Full particulars on application (enclosing postage stamp) to Mr. Hurley, 62, Nelson-square, London.

GLASS FOR CONSERVATORIES, HORTICULTURAL PURPOSES, &c.

T. MILLINGTON'S SHEET GLASS, which is of the best description, varying from 16 to 32 ounces, at from 2d. per foot and upwards; 100 feet and 200 feet cases of large Sheet Glass, for cutting up, at 2½d. per foot. British Plate Glass, from 1s. 2d. to 2s. per foot, according to size. Patent Rough Plate Glass, from ⅛ to 1 inch in thickness, from 4d. per foot upwards. Glass Slates and Tiles. Milk Pans from 12 to 24 inches diameter, from 2s. to 5s. each Cucumber Tubes, from 12 to 24 inches long, at 1d. per inch. Lactometers, 7s. 6d. each. Wasp Traps.—Lists may be had, on application at the Warehouse, 87, Bishopsgate-street Without, same side as the Eastern Counties Railway.

Sales by Auction.

DALSTON NURSERY.

GREAT SALE OF GREENHOUSES, PITS, &c.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, BUILDERS, AND OTHERS.

MESSRS. PROTHEROE and MORRIS are instructed, by Mr. J. Smith, to submit to pubic competition by Auction, on the premises, Dalston Nursery, Middlesex, on MONDAY, September 2, at 12 o'clock (in consequence of the premises being required by the London and Birmingham West India Dock Junction Railway Company), the erection of 14 Greenhouses, several Pits, and one, two, and three-light Boxes, the greater portion of which are glazed with green glass; also a considerable quantity of Bricks, Paving Stones, Hot-water Pipe, Furnaces, &c. May be viewed prior to the sale. Catalogues may be had (1s. each, returnable to purchasers) of the principal Seedsmen in London, on the Premises, and of the Auctioneers, American Nursery, Leytonstone, Essex.

N.B. The whole of the choice Greenhouse Plants (including the Camellias, ranging from 18 inches to 10 feet, beautifully set with bloom buds) will be sold by Auction the latter part of September.

FULHAM ROAD.

TO GENTLEMEN, NURSERYMEN, AND OTHERS.

MR. D. A. RAMSAY has been favoured with instructions from Mr. J. Shearman, to submit to public competition (his lease having expired), on the premises, near Queen's Elm, Fulham-road, Brompton, about the first week in October, a portion of the VALUABLE NURSERY STOCK, comprising Standard and Dwarf-trained Peaches, Nectarines, &c., a large quantity of fine Evergreens, Deciduous Shrubs, Ornamental Trees, &c. A choice assortment of Standard and Dwarf Roses, &c. Further particulars in future Advertisements.—Brompton Nursery, Fulham-road, Brompton.

AMERICAN PLANTS, STANDARD ROSES, ORNAMENTAL TREES, &c.

MR. D. A. RAMSAY will sell by Auction, at the Brompton Auction Ground, Fulham-road, Brompton, one mile from Hyde-park corner, on TUESDAY, Oct. —, 1850, at 1 o'clock, a large quantity of choice AMERICAN PLANTS and other Miscellaneous Stock, the property of a country nurseryman, full particulars of which will appear in future Advertisements.—Brompton, Aug. 17.

CHELSEA.—IMPORTANT SALE OF NURSERY STOCK.

TO NOBLEMEN, GENTLEMEN, AND OTHERS, ENGAGED IN PLANTING.

MR. D. A. RAMSAY has received instructions to submit to public competition, by Auction, on the Premises, opposite Cremorne Gardens, King's-road, Chelsea, about the last week in September (without reserve), by order of Messrs. W. Dennis and Co., to clear about 5 acres of the land required for building purposes. The Stock comprises a large assortment of fine Evergreens, large Irish Ivies and other creepers in pots, 300 varieties of the finest Prize Gooseberries, a large quantity of Mulberry Trees of all sizes, the collection of Standard, Dwarf, and Pillar Roses, choice Deciduous Shrubs, Ornamental Trees, &c. The Stock on view till the time of sale; and for further particulars, see future Advertisements.

Brompton Auction Ground, Fulham-road, Brompton.

D. A. RAMSAY, Auctioneer, Valuer, &c., Brompton Auction Ground, Fulham-road, Brompton, takes this opportunity of returning his grateful thanks to his patrons, friends, and the trade in general, for the liberal support he has been honoured with, and trusts that by a continuance of his personal attention, with strictly moderate charges, he shall deserve their future patronage.

THE SURPLUS STOCK OF MESSRS. VAUGHAN AND CO.'S ARTIFICIAL STONE WORKS, preparatory to the Removal of the Firm to more extensive premises.

TO THE NOBILITY, GENTRY, ARCHITECTS, BUILDERS, FLORISTS, AND OTHERS.

MR. F. W. GODDARD (late with Messrs. Musgrove and Gadsden) has been favoured with instructions to sell by Auction, on the premises, 60, Stones'-end, Borough, on TUESDAY, August 27, at 11 o'clock, the SURPLUS STOCK of the above eminent manufacturers, whose productions enjoy an universal reputation for durability, elegance of design, and exquisite finish. It comprises finely modelled Statues after the ancient and modern masters, including Bacchus, Ceres, Hebe, Piping Faun, Baily's Eve at the Fountain Flora and Paris, Children after Chantrey, Faith, Hope, and Charity, the Seasons, the Elements, &c.; a pair of matchless Sea-horses, a life-size Stag, several pairs of Lions, Sphinxes, Dogs after Landseer, Eagles, and Storks; superb Fountains in every variety of style, pattern, and dimension, choice collection of Vases, Tazzas, and Garden Ornaments, Sepulchral Urns, Church Font, Head-stone, Coats of Arms, Sun-dial, Gothic Panels and Tracery, Caps, Trusses, and other Architectural Decorations, Balustrades, Sinks, Kerbs, two 12 feet Scagliola Columns with Ionic Capitals, and numerous other items.—To be viewed the day previously and morning of sale. Catalogues may be had on the premises, and at Mr. F. W. Goddard's Auction and Estate Agency Offices, 2, Moorgate-street, near the Bank, London.

VALUABLE NURSERY AND SEED TRADE FOR SALE.—The Business referred to has been established nearly 60 years, at an important Midland County Town. It possesses a good and extensive connection. The Nursery is of moderate extent, and well stocked. The Shop is situated in the Market Place, and most eligible. An applicant of moderate capital, with the requisite knowledge and energy, will be liberally treated with, and a Lease granted.—The Proprietor's address can be had at the Office of this Paper.

TO BE LET ON LEASE, A SMALL FARM, consisting of 61 acres of Arable, Pasture, and Meadow, with small Farm-house, two Cottages, two substantial Barns, Stabling, and other Out-buildings; the whole in good repair, situate about 50 miles south of London. Rent and other outgoings very moderate; a weekly market in the neighbourhood. Apply personally, or by letter, post-paid, to A. B., 7, Gresham-street West, London.

TO AMATEUR FLORISTS, AND OTHERS.

TO BE LET, A Compact Villa Residence, situated close to the Ealing Station, on the Great Western Railway, having front and back Flower Gardens, with span-roofed Greenhouse, 19 feet by 14 feet, with hot-water apparatus, pits, &c., suitable for a gentleman, or for a florist requiring premises on a small scale. The present proprietor removing, will treat liberally for the disposal of the furniture of the house, the garden plants, and stock.—For particulars, apply at Mr. Deek's Auction and Estate Agency Offices, 26, Albion-street, Hyde-park square, London.

TO NURSERYMEN, FLORISTS, AND OTHERS.

TO BE SOLD, by private contract, a very valuable LEASEHOLD NURSERY BUSINESS, of 5¼ years unexpired, at a very low ground-rent, the whole containing about 2000 feet of glass, and a fine stock of Plants, consisting of Camellias, Ericas, and other woody and herbaceous kinds; together with the ground-rents of two houses built on part of the ground.—For further particulars apply personally to Mr. Broadbridge, Priory Nursery, Larkhall-lane, South Lambeth, London.

WILMOT'S "PRINCE ARTHUR" STRAWBERRY.

THE GARDENERS' MAGAZINE OF BOTANY, HORTICULTURE, &c., of Saturday last (No. 37), conducted by Messrs. Moore and Ayres, contains the History and Culture of the above, with a correctly coloured plate, besides other matters interesting to the Florist and Botanist. Publishing in Weekly Numbers, price 6d.

London: Wm. S. Orr and Co., 2, Amen-corner.

ALBION INSURANCE OFFICE,
London, Aug. 12, 1850.

A GENERAL COURT OF PROPRIETORS OF THE ALBION INSURANCE COMPANY will be held at the Company's House, in New Bridge-street, Blackfriars, on Wednesday, the 28th instant, at 12 o'clock at noon, precisely, for the election of three Auditors for the current year, in conformity with the Deed of Settlement.

John Le Cappelain, Actuary and Secretary.

ALBION LIFE INSURANCE COMPANY.
INSTITUTED IN 1805.

Directors.

Matthew Harrison, Esq., Chairman.
John Hampden Gledstanes, Esq., Deputy Chairman.

Thomas Starling Benson, Esq.	T. W. Clinton Murdoch, Esq.
Jas. Whatman Bosanquet, Esq.	David Riddall Roper, Esq.
Frederick Burmester, Esq.	Charles Russell, Esq.
John Coningham, Esq.	Edward Stewart, Esq.
Fredk. Dawes Danvers, Esq.	Francis Wilson, Esq.

ADVANTAGES.—The Profits are divided every three years, and are payable in cash, in augmentation of the sum insured, or in reduction of the annual premium. At the last division in 1849, the cash bonus amounted to one-fifth of the total premium paid. The next division will take place in 1852. New Insurances should be effected before April 30, 1851. Extensive travelling limits, including some of the principal colonies, without the payment of any extra premium. Claims paid in 30 days after proof of death. For forms of proposal, prospectuses, &c., apply to any of the company's agents, or to

John Le Cappelain, Actuary and Secretary.

BRITANNIA LIFE ASSURANCE COMPANY,
1, PRINCES-STREET, BANK, LONDON.
Empowered by Special Act of Parliament, 4th Vic., cap. 9.

Directors.

William Bardgett, Esq.	Robert Eglinton, Esq.
Wm. Fechney Black, Esq.	Erasmus R. Foster, Esq.
George Cohen, Esq.	Peter Morrison, Esq.
Millis Coventry, Esq.	Henry Lewis Smale, Esq.
John Drewett, Esq.	

Auditors.

J. B. Bevington, Esq.; F. P. Cockerill, Esq.; J. D. Dow, Esq.

Medical Officers.

D. W. Cohen, M.D., 6, Cleveland-row.
John Hutchinson, M.D., 105, Milton-street, Dorset-square.
F. Le Gros Clark, Esq., Surgeon, 24, Spring-gardens.

Standing Counsel.

The Hon. John Ashley, New-square, Lincoln's-inn.
Mr. Sergeant Murphy, M.P., Temple.

Solicitor.—William Bevan, Esq., Old Jewry.

Bankers.—Messrs. Drewett and Fowler, Princes-street, Bank.

Among others, the following important advantages may be enumerated.

HALF CREDIT RATES OF PREMIUM.

Persons assured according to these rates are allowed credit (without security) for half the amount of the first seven annual premiums, paying interest thereon at the rate of 5 per cent. per annum, with the option of paying off the principal at any time, or having the amount deducted from the sum assured when the Policy becomes a claim.

Policies may thus be effected at lower rates than are generally required for the term of seven years only; whilst the holders have the same security for the payment of their claims, whenever death may happen, as if they paid double the amount of premium, which would be charged for insurances effected in the usual way.

Increasing Rates of Premium on a new and remarkable plan for securing Loans or Debts; a less immediate payment being required on the Policy for the whole term of life than in any other office.

Policies revived without the exaction of a fine, at any time within twelve months.

A Board of Directors in attendance daily at Two o'clock.

Age of the Assured admitted in the Policy.

Medical attendants remunerated in all cases for their reports.

Extract from the Half Credit Rates of Premium:

Annual Premium required for an Assurance of £100 for the whole term of Life.

Age.	Half Premium for seven years.	Whole Premium after seven years.
	£ s. d.	£ s. d.
30	1 1 9	2 3 6
35	1 4 11	2 9 10
40	1 9 2	2 18 4
45	1 14 10	3 9 8
50	2 2 6	4 5 0
55	2 12 9	5 5 6
60	3 6 8	6 13 4

Peter Morrison, Resident Director.

ANNUAL DIVISION OF PROFITS.

GREAT BRITAIN MUTUAL LIFE ASSURANCE SOCIETY, 14, Waterloo-place, and 52, King William-street, City.

The Chisholm, *Chairman.*

Richard Hartley Kennedy, Esq., *Deputy Chairman.*

This Society is established on the tried and approved principle of Mutual Assurance. The Funds are accumulated for the exclusive benefit of the Policy-holders, under their own immediate superintendence and control. The Profits are divided annually, and applied in reduction of the future Premiums. At the Annual General Meeting, held on the 9th ult., an elaborate and highly satisfactory Report of the state of the Society's affairs was submitted to the members, whereupon it was resolved, unanimously, that an allowance of 30 per cent. should be made on the Premiums payable on all Policies on the participating scale, on which five or more yearly payments had been previously made. Credit is allowed for Half the Annual Premium for the first five years. The following Table exemplifies the effect of the present reduction:

Age when Assured	Amount Assured	Annual Premium hitherto paid.	Reduction of 30 per cent.	Annual Premium now payable.
	£.	£ s. d.	£ s. d.	£ s. d.
20	1000	20 17 6	6 5 3	14 12 3
30	1000	25 13 4	7 14 0	17 9 4
40	1000	33 18 4	10 3 0	23 14 10
50	1000	48 16 8	14 13 0	34 3 8

A. R. Irvine, Managing Director.

GRAND DAHLIA, HOLLYHOCK, AND MISCELLANEOUS FLOWER SHOW.

ROYAL SOUTH LONDON FLORICULTURAL SOCIETY. Under the Patronage of HER MOST GRACIOUS MAJESTY, THE QUEEN.

THE FIFTH AND LAST EXHIBITION for this season will be held at the ROYAL SURREY ZOOLOGICAL GARDENS, on WEDNESDAY, the 4th of September, 1850 (Open to all Exhibitors), when Prizes will be awarded for the following productions, viz. Miscellaneous and Specimen Plants, Dahlias, Hollyhocks, Verbenas, Antirrhinums, Cut Flowers, and Fruit. In addition to the Prizes offered by the Society, 2*l.* 10*s.* will be given for the best stand of 3 blooms of Seedling Dahlias in 1, 2, or 3 varieties (not sent out) of the exhibitor's own raising, and 2*l.* 10*s.* for Fancy Dahlias, ditto. Lists of Prizes and the Rules for exhibiting may be obtained from JOHN T. NEVILLE, Secretary, Ebenezer House, Peckham, Surrey.

SUTTON BENGER HORTICULTURAL AND FLORAL SOCIETY.—This Society will hold their 12th Annual Meeting in Draycot Park, on THURSDAY, Aug. 29.

THE SOUTH OF ENGLAND HORTICULTURAL SOCIETY.—A Grand Exhibition of FLOWERS, FRUITS, &c., will take place (by the kind permission of Major Colt), upon his beautiful Grounds at ROWNHAMS, near Southampton, on THURSDAY, the 5th of September. Every arrangement will be made to promote the comfort of the visitors, as well as the attraction of the Fêtes. The whole of the arrangements will be made under the direction of Mr. Ross, of the Horns, Nursling. Lady Mill, Mrs. Chamberlayne, and Mrs. Colt have kindly consented to patronise the exhibition. The Lady Patronesses' private Subscription Prizes will be given extra to Cottagers within eight miles of Rownhams, for the best collection of Fruits, Flowers, and Vegetables. The Gardens will be open at 1 o'clock. Admission by Tickets, previous to the 3d of September, at 1*s.* 6*d.*; if on that day, 2*s.* 6*d.* each. Colonel Yea and the Officers of the Royal Fusiliers have kindly placed their band at the disposal of the Committee.

Persons attending the Exhibition are requested to enter by the Nursling Lodge, and retire by the Baddesley Lodge.

THE BIRMINGHAM AND MIDLAND COUNTIES DAHLIA SHOW (open to all England) will be held in the Hall of Nations, Coleshill-street, Birmingham, on Monday, September 2d, and Tuesday, 3d, 1850.

Schedules and full particulars may be obtained of Mr. HOLDER, Coleshill-street, or Mr. MORETON, Hon. Secretary, Cregoe-street, Birmingham.

NEW SEED OF TRIFOLIUM INCARNATUM, DICKINSON'S IMPROVED ITALIAN RYE-GRASS, NATURAL GRASSES FOR PERMANENT PASTURE, AND WINTER VETCHES.

JOHN SUTTON AND SONS have just harvested the above valuable articles for present sowing, and will send them carriage free at very low prices.

Prices and other particulars may be had by post on application to JOHN SUTTON AND SONS, Reading, Berks.

THE BLACK PRINCE STRAWBERRY will be ready for sending out on the 2d of September next. It has gained two prizes recently, one at the Horticultural Society's Rooms in Regent-street, the other at the Royal Botanic Society, Regent's Park. It is the earliest of all Strawberries, excellently well flavoured, and a very prolific bearer. The fruit is medium sized, and very dark coloured when fully ripe; price 10*s.* per 100.

CUTHILL'S TREATISES will be published in a few days; they include a competition Essay on the Potato, sent to the Belgian Government; Management of Asparagus, Seakale, Rhubarb, Vegetable Marrow, Scarlet Runner, Strawberry, Melon, Cucumber, Chicory and Lamb Lettuce (the two latter as Salads), the Lisianthus Russellianus, Tree Mignonette, destruction of Woodlice and Green-fly, and Peat Charcoal as a manure. Price 2*s.*, or, by post, 2*s.* 6*d.*—To be had only of JAMES CUTHILL, Horticulturist, Camberwell, London.

WATERER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, &c.

HOSEA WATERER begs to announce his new descriptive CATALOGUE OF AMERICAN PLANTS, CONIFERS, ROSES, &c., is just published, and may be had by enclosing two stamps for postage to HOSEA WATERER, Knap Hill Nursery, Woking, Surrey.

☞ Everybody who has any idea of planting the ensuing autumn should possess themselves of this Catalogue.

FLORAL NOVELTY. — PANSY COMPACTUM, or DOUBLE PANSY, named and described by Mr. G. GLENNY, to whom specimens were sent. From the habit and growth of this superb Pansy, with a profusion of flowers standing out upon long foot-stalks, it is rendered eminently attractive, and will doubtless form a standing ornament to the Flower Garden. N.B.—Strong plants will be sent out the first week in October, at 5*s.* each, or seven for 30*s.* Orders taken by A. DODS, Rose-hill Nursery, Brighton, who will execute them in rotation on receiving remittances from unknown correspondents.—Brighton, Aug. 24.

A LIST OF NEWLY INTRODUCED PLANTS NOW OFFERED FOR THE FIRST TIME BY JAMES VEITCH AND SON, EXETER:

Escallonia macrantha, 21*s.* each; one over to the Trade on three.
Ixora salicifolia, 21*s.* each; ditto.
Dipladenia urophylla, 21*s.* each; ditto.
Hoya coriacea, 10*s.* 6*d.* each; ditto.
Dipteracanthus spectabilis, 10*s* 6*d.* each; ditto.
Oxalis elegans, or Oxalis elegans major, 5*s.* each, or three for 10*s.* 6*d.* of either.
Calceolaria grandis, 5*s.* each, or three for 10*s.* 6*d.*

IXORA SALICIFOLIA (TRUE), WILLOW-LEAF IXORA.

MESSRS. VEITCH AND SON are now prepared to send out strong plants of the above beautiful and distinct IXORA, received by them from Java through Mr. Thos. Lobb. It is a lovely free-blooming species, flowering in a very young state, and at the Chiswick Exhibition in July last received the first prize for new and rare plants—the Silver Gilt Medal. It is figured and described in Curtis's "Botanical Magazine" for July last.

Strong well established plants 21*s.* each; one over to the Trade on three.—Exeter, Aug. 24

RENÉ LANGELIER, of the Clarendon Nursery, St. Helier, Jersey, takes the liberty of informing Amateurs of PEARS that his very extensive collection is now in full bearing, and embraces the present opportunity of soliciting their inspection of the different sorts now on the trees; many of the summer kind may be tasted. Communication from all parts of England daily, viâ London, Brighton, Southampton, Weymouth, Torquay, and Plymouth. R. L. is confident that amateurs of Pears will be gratified by an inspection.

DIGITALIS PURPUREUS SUPERBUS, or DOUBLE FOXGLOVE.

In page 435 of the present volume of the *Gardeners' Chronicle* is a wood-cut of this singularly attractive variety of Foxglove. Seeds have just been saved from the plant figured, and may be obtained in 1*s.* packets, by enclosing stamps to the amount to WM. URQUHART and SONS, Dundee.

TILEY'S VIOLA ARBOREA, OR PERPETUAL TREE VIOLET.—VIOLA ARBOREA, or the PERPETUAL TREE VIOLET (true).—In answer to numerous inquiries for the above, and great satisfaction given by the plants sent out last season by EDWARD TILEY, he begs to state that he has this year a fine stock of the above beautiful DOUBLE VIOLET now to dispose of, which he can highly recommend, this being the proper time for making beds or potting. They are beautifully scented; the blooms are as large as the double blue Hepatica; they bloom freely from August till the end of May, and are perfectly hardy. Twelve of these plants grown in pots will scent a large greenhouse, and a small bed, 9 feet long by 3 feet wide, will be sufficient to furnish a family with bouquets the whole of the winter and the spring. They should be planted in rather a dry situation and a loose soil, as the Violet will thrive and bloom finer than in wet or clay borders.

E. T. has been informed by the gentleman that introduced it into this country, that he has seen them growing in the thickets of Persia to the height of 4 feet, with large bushy heads to them, and hundreds of blooms on them at the same time. Large bushy plants, 6*s.* per dozen; smaller ditto, 3*s.* per dozen; or 1*l.* per hundred.

Also he has a fine stock of that splendid YELLOW VIOLET, or VIOLA LUTEA, which has been so much admired at the London exhibitions. In colour it is equal to the Crocus. Strong bushy plants 2*s* 6*d.* each; or smaller ditto, 1*s.* 6*d.* each.

KITLEY'S GOLIAH STRAWBERRY.—Strong well rooted plants at 3*s.* per dozen.

True BATH COS LETTUCE SEED, 1*s.* per packet.

Extra fine SWEET-WILLIAM SEED, saved from 24 distinct varieties, 1*s.* per packet.

ANTIRRHINUM SEED from all the best varieties, 1*s.* per packet.

WINTER CUCUMBER.—Lord Kenyon's Favourite, 2*s.* 6*d.* per packet.

The whole or any quantity of the above will be sent, postage and package free, to any part, on receipt of a Post-office order, or the amount in penny postage stamps.

Sold by EDWARD TILEY, Nurseryman, Seedsman, and Florist, 16, Pulteney-bridge, Bath.

NURSERIES, CLAPHAM, NEAR LONDON.
FINE LATE STRAWBERRY, "LA DELICIEUSE."

J. & J. FAIRBAIRN have much pleasure in announcing that they will be prepared to send out the above early in September.

J. and J. F. can with confidence recommend this STRAWBERRY, as one possessing first-rate excellence. Its distinguishing characters are—the plant, of hardy habit and great productiveness of bearing; fruit, rather above medium size and of exquisitely rich flavour; colour, amber, like a Bigarreau Cherry; season of ripening late, after most other Strawberries are over; fruit firm, remaining good longer after ripe than other varieties, thus lengthening the Strawberry season by a considerable period. From its many excellences, it will be found an acquisition in any establishment. Price, 60*s.* per 100; or 12*s.* per dozen. N.B. A remittance with order respectfully requested from unknown correspondents. Orders addressed to J. and J. FAIRBAIRN, Nurseries, Clapham, near London; or to the following Agents, will have prompt attention.

Austin and M'Aslin, Glasgow	Harrison, John, Darlington
Bunyard, T., Maidstone	Harrison, T., Hindon, Wilts

	Wheeler, J. C. & Co., Gloucester

MESSRS. STANDISH AND NOBLE'S new descriptive CATALOGUE OF SELECT HARDY ORNAMENTAL PLANTS is just published, and may be had for four postage stamps. Besides a Treatise on the cultivation of American Plants, it contains a Plate and Description of the Funebral Cypress, Notices of Cephalotaxis Fortunii, Cryptomeria japonica, Quercus sclerophylla and inversa, Viburnum plicatum and macrocephalum, with many recent introductions from the north of China, quite new to English gardens.

Messrs. S. and N. take this opportunity of stating that they give Designs for Laying out New Grounds and Plans for Improvements; also Estimates for all kinds of Planting, whether ornamental or economic.—Bagshot Nurseries, Aug. 24

HUGH LOW AND CO. have just published their GENERAL CATALOGUE OF PLANTS, which can be had free on application.—Clapton Nursery, London, Aug. 24.

NEW LATE STRAWBERRY,
WILMOT'S "PRINCE ARTHUR."

J. WILMOT, in offering this new variety of STRAWBERRY to the Public, is confident that it combines qualities which no other kind at present in cultivation does possess, being of delicious flavour, and coming in after the principal Strawberry season is over. It possesses the property of firmness of texture, so that it may be transmitted to any part of the kingdom without sustaining injury, as it may be kept for several days after being gathered, when fully ripe, without any indication of decay or loss of flavour.

"Prince Arthur" is one of the largest sized Strawberries, and a most abundant bearer; the foliage is small, and never exceeds 6 inches in height; the fruit is consequently fully exposed to the sun. Its dwarf habit requires it to be planted not more than a foot apart. The fruit is perfectly formed, of a rich scarlet, and colouring equally all over the berry. If planted at the distance recommended it will produce double the weight per acre of any other variety.

Strong plants will be ready for sale in September next, at 5*l.* per 100, on prepaid application only, to JOHN WILMOT, Isleworth, Middlesex; Robert Glendinning, Chiswick Nursery; William T. Atwood, Mortlake, Surrey; George Charlwood, Seedsman, Covent-garden; and Messrs. Hurst and M'Mullen, 6, Leadenhall-street, London.—Isleworth Middlesex, Aug. 24.

PELARGONIUM, "FOQUETT'S MAGNIFICENT."

CHARLES DIMMOCK, FLORIST, Ryde, Isle of Wight, having obtained a stock of the above from the raiser, will send out Plants, well-established, in 3-inch pots, in the first week in October next, at 7*s.* 6*d.* per plant, or 30*s.* for six, to the trade.

This flower has proved one of the most desirable of its class in cultivation, being a free bloomer, extraordinary trusser (some of the trusses had nine pips), very constant, and strong habit, the shape, colour, size, and substance is first-rate.—Terms: cash, and priority of payment will ensure priority of selection.

Nurseries, 113, High-street, Ryde, Isle of Wight, Aug. 24.

DANIEL BUTLER has purchased the Stock of SEEDLING CINERARIAS of Mr. J. Pond (a successful Amateur), of Devonshire Cottage, Bath, saved from the best sorts in cultivation with great care; all Show Flowers, viz., Madam Cerito, Sir Charles Napier, Bridesmaid, Lilac Perfection, Climax, Blue Beard, Dazel Rosea, Fairy, Lord Gough, Queen of May, and Beauty of Newington. The plants will be all had from Devonshire Cottage by D. B. as they are sent out, all true from the sorts named above. This will present an opportunity of possessing a first-rate collection at a very low price, viz., 4*s.* per doz. A deduction where a large quantity is taken.

N.B. A remittance expected from unknown correspondents.
Widcombe Nursery, Bath, Aug. 24.

KITLEY'S GOLIAH STRAWBERRY. — The merits of this Strawberry are now so well known, as being hardy, large, fine in colour, a most excellent flavour, and forces well, that all parties who have seen it growing, or tasted the fruit, have expressed their entire satisfaction with it. This is the fifth season it has fruited in the same bed, and the plants are now perfectly healthy, and likely to continue much longer in bearing; the fruit this season have been as large and more abundant than from younger plants.

From the *Gardeners' Chronicle*.—"STRAWBERRIES: *J. K.* Your Seedling Strawberry, Goliah, judging from its size and appearence, is worthy of cultivation."

From the *Gardeners' and Farmer's Journal*.—"STRAWBERRIES. *J. K., Lyncombe Vale*.—We have great pleasure in bearing testimony to the exquisite flavour of your Seedling Strawberry, 'Goliah.' In our opinion, it combines the piquant flavour of the Strawberry with the richness of the Pine, the delicious aroma of which it partakes in equal proportion to taste. Apart from the Queen of Fruits, we certainly do not remember anything in this way that conveyed to our senses so delicious a treat as the noble fruit to be known to the world as 'KITLEY'S GOLIAH STRAWBERRY.'"

Strong well-rooted plants are now ready at 3*s.* 6*d.* per dozen, or 1*l.* per 100, on prepaid application only to JAMES KITLEY, Bath; Messrs. Low and Co., Clapton Nursery; Mr. J. G. Waite, Seedsman, 181, High Holborn, London; Messrs. Garraway, Mayes, and Co., Bristol; Messrs. Lucombe, Pince, and Co., Exeter; and Messrs. W. E. Rendle and Co., Plymouth.

Lyncombe Vale Nursery, Bath, Aug. 24.

WILLIAM YOUNG begs the attention of Noblemen, Gentlemen, and Planters in general to inspect his extensive collection of CONIFEROUS PLANTS, consisting of Araucarias, Deodars, Douglasii, and all the leading kinds, from 1 foot to 10 and 15 feet high, with Cryptomeria japonica, bearing perfect cones.

Milford Nursery is one square piece of ground, about 30 acres, on a particular dry and healthy soil, filled with the most choice kinds of Ornamental Trees, Shrubs, and Forest Trees, of every description; Ash, Birch, Chestnut, Hazel, Willow; Scotch, Larch, Silver, and Spruce Firs; and other hardy Forest Trees, being planted for sale by the 100,000, whence they transplant equal to, if not better, than any other nursery in England.

Milford Nursery is two miles from the Godalming Station of the South-Western Railway, where conveyances are always in attendance.

EXHIBITIONS AT THE GARDEN
OF THE
HORTICULTURAL SOCIETY OF LONDON,
FOR THE YEAR 1851.

THE EXHIBITIONS WILL TAKE PLACE ON THE FOLLOWING SATURDAYS :—
MAY 3, JUNE 7, AND JULY 19.

SCHEDULE OF THE PRIZES.

FLOWERS.

(Pots are to be measured inside, 1 inch below the rim.)

Division I.—In which Nurserymen and Private Growers exhibit independently of each other.

1. Pelargoniums; in collections of 12 new and first-rate varieties, with perfectly distinct colours, cultivated with superior skill, in 8-inch pots. SG—CE—LS.
   N.B. The collections in which the varieties are most distinct *will have the preference.*
2. Pelargoniums; in collections of 9 varieties, in 11-inch pots. SG—CE—LS.
   N.B. Any plant that shall not have been actually grown in 11-inch pots will be disqualified.
3. Fancy Pelargoniums; in sixes, in 8-inch pots. CE—LS—SK.
4. Roses, in pots; in collections of 12 distinct varieties, in 13-inch pots. GB—SG—CE. *(In May and June only.)*
   N.B. The Judges will disqualify any collection that shall be found to contain a plant which has been recently placed in the pot from the open ground, or that is shown in a pot of any other size than 13 inches.
5. Yellow Roses, best six varieties. SK—SB—C. *(In June only.)*
   N.B. To be really yellow; pale-cream colours are inadmissible.
6. Cape Heaths; in collections of 10 entirely distinct varieties. GB—SG—CE.
   N.B. It is expected that the same plant shall not be exhibited on more than one occasion. The Judges, in making their award, will give, both in this and the next number, a marked preference to plants grown in their natural forms, without stakes or stays; and will also take distinctness of species into favourable consideration. No duplicate will be allowable.
7. Cape Heaths; in collections of 10 entirely distinct varieties, in 11-inch pots. SG—CE—LS.
8. Carnations, in collections of 12 distinct varieties, in 11-inch pots. CE—LS—SK. *(In July only.)*
9. Picotees, in collections of 12 distinct varieties. CE—LS—SK. *(In July only.)*
10. Pinks; in collections of 12 distinct varieties. SK—SB—C. *(In June only.)*
    N.B. Carnations, Picotees, and Pinks can only be shown as perfect plants grown in pots. Cut flowers in boxes will no longer be received.
11. Calceolarias, in twelves; in 11-inch pots. LS—SK—SB.
    N.B. No medals are to be awarded unless the plants are in very high health and extremely well grown. *(In May and June only.)*

Division II.—In which Nurserymen alone can show.

12. Exotic Orchids; in collections of 15 species of superior cultivation. GB—SG—CE.

Division III.—In which all persons are admitted to equal competition.

13. Single specimens of very superior cultivation, excluding everything which can be shown singly in other numbers, and plants not in flower. CE—LS—SK
14. Stove or Greenhouse plants; in collections of 20 plants. LG—GK—GB.
    N.B. Calceolarias, Fuchsias, Orchids, Pelargoniums and duplicates are excluded from all the four classes of Stove and Greenhouse plants. Only three species or varieties of the same genus can be allowed in this and the following number.
15. Stove or Greenhouse plants; in collections of 15 plants. GK—GB—SG.
16. Stove or Greenhouse plants; in collections of 10 plants. GB—SG—CE.
    N.B. Only two species or varieties of the same genus can be allowed in this number.
17. Stove or Greenhouse plants; in collections of 6 plants. SG—CE—LS.
    N.B. Not more than one species or variety of the same genus can be allowed in this number. No one can show in more than one of the classes of Stove and Greenhouse plants.
18. Greenhouse Azaleas in 12 distinct varieties. GB—SG—CE.
19. Greenhouse Azaleas; in 12 of the newer kinds, in 8-inch pots. SG—CE—LS.
20. Greenhouse Azaleas; in 6 distinct varieties. SG—CE—LS.
    N.B. No one can show in more than one class of Azaleas.
21. Indian Rhododendrons, and their hybrids; in 12 distinct varieties. GB—SG—CE. *(In May only.)*
22. Cape Heaths; in sixes, grown in 8-inch pots. CE—LS—SK.
23. Exotic Orchids; in collections of 20 species of superior cultivation. LG—GK—GB.
24. Exotic Orchids; in collections of 10 species of superior cultivation. GB—SG—CE.
25. Exotic Orchids; in collections of six species. SG—CE—LS.
    N.B. Nurserymen cannot show in either of these three classes of Orchids. No exhibitor can show in more than one of them.
26. Exotic Orchids; single specimens displaying *very* superior cultivation. SK—SB—C.
    N.B. No duplicate Medals can be here awarded.
27. Fuchsias; in threes, of three distinct colours. LS—SK—SB. *(In July only.)*
28. Pelargoniums; in six DISTINCT SPECIES, exhibiting superior cultivation. CE—LS—SK.
    N.B. By the word species is meant the wild kinds imported from the Cape of Good Hope, or New Holland, tuberous species inclusive, and not garden cross-breds.
29. Achimenes; in collections of six distinct varieties, exhibiting superior cultivation. CE—LS—SK. *(In July only.)*
30. Tall Cacti; six distinct varieties in flower. SG—CE—LS.
31. Roses of 50 varieties in loose bunches, each consisting of three trusses as they are gathered, so as to exhibit, as far as possible, the habit of the variety. CE—LS—SK. *(In July only.)*
    N.B. No one who exhibits in this number can also compete in the following.
32. Roses, exhibited as in No. 31, and in 25 varieties. LS—SK—SB. *(In June and July only.)*
    N.B. Private growers only can exhibit here. If Roses are brought for exhibition without attention to the regulations here explained, they will not be allowed to compete.
33. Helichrysums. CE—LS—SK.
34. Calosanths; in sixes. LS—SK—SB. *(In July only.)*
35. Statices; in collections of six species. CE—LS—SK.
36. Ferns, in collections of 10 hothouse species of very superior cultivation. LS—SK—SB. *(In July only.)*
37. New Hybrid Plants, exclusive of Roses, Rhododendrons, Azaleas, and garden cross-breds, such as Gloxinias and the like. SG—CE—LS.
    N.B. It is certain that much may be effected by hybridising plants in common cultivation, such as Lilacs, Honeysuckles, &c. &c. This class will be judged by the Society's officers.
38. Epacrises; in sixes. CE—LS—SK *(In May only.)*
39. Newly introduced or extremely rare ornamental plants in flower, not introduced by the Society. SG—CE—LS.
    N.B. These Medals will be awarded by the Society's officers, and not by the usual Judges. Exhibitors will particularly observe that none but new or rare plants can be exhibited under this number. *Nothing will be regarded as new which has been exhibited in the Garden or Regent-street in a previous season,* nor garden seedlings, hybrids, nor domesticated varieties of any kind. No prizes will be given to New Plants which have been introduced through the Society.
40. Miscellaneous subjects, exclusive of Ferns. SK—SB—C.
    N.B. Exhibitors under No. 40 will not be thereby *entitled* to a pass ticket. Cockscombs, Heartsease, Hydrangeas, and bouquets, together with all plants for which separate prizes are offered as single specimens, are altogether excluded from this number.
41. Seedling Hybrid Pelargoniums, of entirely new crosses. SB—C.
    N.B. Every seedling must be shown singly, and marked with the name it is to bear. The same seedling cannot gain a prize more than once in the season. The plants must be shown in pots, and not in a cut state.
42. Pansies; in twelves, in 8-inch pots. SK—SB—C.
43. Alpines; in twelves. SK—SB—C.
44. Cinerarias; in sixes, in 8-inch pots. SK—SB—C. *(In May only.)*
    N.B. Prizes will only be given to extremely fine specimens.
45. Seedling Florists' Flowers.
    A tent will be provided for the exhibition of these; but no medals will be awarded, *nor will they be entered.* The exhibitors will themselves mark their seedlings in their own way. The Society declines to express any opinion upon the merits of seedlings.

FRUIT.

Market Gardeners, or Growers (not Fruiterers), in the habit of supplying the Market, and Private Gardeners, exhibit independently of each other. Fruiterers are not allowed to exhibit at all. No duplicate awards can be made in any case whatever, except in O and P. No person can take more than one award in each Letter, except in B, D, I, L, N, O, P.

N.B. All Fruit must be sufficiently ripe for Market, WELL COLOURED, and PROPERLY NAMED by the Exhibitor, as far as practicable; if the contrary, it will be disqualified.

A Collections of Fruit. GK—GB—SG *in May.* GB—SG—CE *in June.* SG—CE—LS *in July.*
   N.B. No person receiving a prize for a collection, can also receive a prize for any separate exhibition of fruit.

B Pine Apples, in single specimens :—
   1. Queens. LS—SK—SB.
   2. Enville, Cayennes, Sugarloafs, Black Jamaicas, Otaheites, &c. LS—SK—SB.
   3. Providences. LS—SK—SB.

C Grapes in pots; three specimens to be shown. CE—LS—SK

D Grapes; in three bunches for private growers, and six bunches for Market Gardeners :
   1. Black Hamburgh. LS—SK—SB.
   2. Black Prince, or West's St. Peters. LS—SK—SB.
   3. White Muscadines, or Sweetwaters. LS—SK—SB.
   4. Muscats. LS—SK—SB.
   5. Frontignans, or other sorts, distinct from the foregoing. LS—SK—SB.

E Peaches, in sixes. SK—SB—C.

F Nectarines, in sixes. SK—SB—C.

G Apples and Pears of the previous year. SB—C.

H Figs, in sixes. SB—C.

I Cherries, in dishes of 1 lb. each :
   1. Black. SB—C. 2 White. SB—C.

K Strawberries, in pots; six pots to be shown. SK—SB—C.
   N.B. They must have grown in the pots in which they are shown.

L Strawberries, one dish each :
   1. British Queen, and similar kinds. SB—C.
   2. Keens' Seedling, and similar kinds. SB—C.
   3. Other kinds. SB—C.

M Oranges, Citrons, &c., in pots; no one to show more than one pot. LS—SK—SB.
   N.B. This class of Fruits is excluded if gathered.

N Melons, one specimen each, for the best flavoured. SK—SB—C.

O New varieties of any of the preceding kinds of fruit.

P Other kinds of fruit of peculiar excellence and value.
   N.B The medals under this and the preceding letter will be given at the discretion of the Society's officers.

MESSRS. VEITCH AND SON'S CATALOGUES OF NEW AND RARE PLANTS, STOVE AND GREENHOUSE PLANTS, GERANIUMS, AMERICAN PLANTS, &c., &c., are now ready, and can be had, on pre-paid application, by enclosing two postage stamps.—Exeter, August 24.

KITLEY'S GOLIAH STRAWBERRY.
ROBERT WHIBLEY has now ready fine plants at a very reduced price for cash, viz., 2s. per doz., or 10s. per 100. Also, Select CHRYSANTHEMUMS, from his well-known collection, from 6s. per dozen. Lists can be had.
Nursery, Kennington, London.

SAFFRON WALDEN.—SUPERB DOUBLE HOLLYHOCKS.
WILLIAM CHATER begs to announce that his NEW CATALOGUE is now ready, and may be had on application, by enclosing a postage stamp.
Hints on their cultivation given to purchasers, if requested.

CUTHILL'S BLACK PRINCE STRAWBERRY.—Those who by early planting wish to secure a full crop next season of the above Strawberry can have well rooted plants, fit for immediate delivery, sent free by post to any part of the kingdom (or in packages paid to London), by sending an order, or stamps, for 10s. 6d per 100, or 6s. for 50, to J. MICKLE, Folkestone, Kent.

GRAPE VINES IN POTS FOR FORCING.
J. WEEKS AND CO., King's-road, Chelsea, beg to call attention to their splendid collection of Grape Vines, all struck from eyes, now two and three years old, the finest Plants that have ever been offered for Sale, consisting of 60 varieties, all of the best sorts, warranted true.
THE HAMBURGHS AND MUSCADINES being the best for early forcing in pots, this is the best time for Gardeners to have them, so as to get the eyes ripe and prominent. This Nursery is well worthy of a visit, as all modern Horticultural improvements are in full operation.
J. WEEKS and Co., King's-road, Chelsea.

TO FLORISTS AND AMATEURS.
ESTABLISHMENT FOR THE INTRODUCTION OF NEW PLANTS, LUXEMBURG.
The undersigned, Agents to the above Establishment, are prepared to receive and transmit orders for the following new plants, lately introduced by J. LINDEN, of Luxemburg, deliverable on and after the 1st of September next.
FUCHSIA VENUSTA, H. B. K.—Strong plants, 1l. One of the most splendid species introduced, and far superior to Fuchsia serratifolia, of a similar habit, but differing therefrom by very large flowers; calyx of a lively vermilion orange, and large extended petals of a coral red. Native of the cold regions of New Grenada. This remarkable plant carried away the first prize at all the principal shows in Belgium, and is represented in the "Flore des Serres" for December, 1849.
FUCHSIA NIGRICANS, LINDEN.—Strong plants, 8s. Handsome species, an abundant flowerer, with dark purple petals.
ALLOPHLECTUS CONGESTUS, DECAISNE.—Strong plants, 12s. See description in Catalogue, to be had as under.
BOMARIA EDULIS.—Strong plants, 12s. A charming climber, lance-shaped leaves, light green above, dark red, spotted with yellow. This beautiful specimen carried away a medal at the great exhibition at Ghent.

BEFARIA ÆSTUANS	...	...	£1 4s.
,, DENSA	...	...	1 0
,, TRICOLOR	...	...	1 8

BETHAM AND BLACKITH, AGENTS FOR FLORISTS, Custom House and General Agents, Cox and Hammond's Quays, Lower Thames-street, London, Aug. 24.

IMPORTANT TO GARDENERS, &c.
R. RESTELL'S METALLIC FLEXIBLE GARDEN PEGS, PROPS, AND HOLDERS, will effect great saving in the Gardener's time, and last for years, giving an appearance of neatness and uniformity, and from their composition will not cause the slightest injury to the most delicate plants. Price 2s. per lb. The number varying according to weight. In the first 10 sizes, from 150 to the lb. Warranted not to corrode.—To be had of the principal Seedsmen and dealers in Horticultural Implements; and, wholesale, at the Manufactory of the Patent Metallic Ornamental Labels, 35, High-street, Croydon, Surrey.

STEELE'S PREPARATION, for preventing Weeds, Moss, &c., from growing on Parades, Garden-walks, and Roads. Sold in 5-gallon bottles, at 1s. 6d. per gallon.
Also, PEAT, BOG-EARTH, and LOAM, in bags not less than 5 cwt., at 9d. per cwt.
Orders, enclosing Post-office orders made payable to JONATHAN STEELE, Post-office, Dockhead, immediately forwarded to any part of the country.
Factory, Plough-road, Rotherhithe.

PIMLICO SLATE WORKS.—Cisterns, Filters, Milk and Salting vessels, Corn and Flour Chests, Sinks, Dairy and Larder Shelves, Malting and other Flooring, Skirting, Refrigerators, Garden Edging, Flower Boxes, Pine pit Linings, Hot-bed Frames, moveable Cattle Sheds, Coping, Drain Stones and Traps, Steps and Risers, Balcony Landings, Roofing Slates, ridge roll and flap; Waste Slate for drains, Sun Dials, Fountains, and all descriptions of plain Slate Work in Town, or direct from Mr. MAGNUS'S Works in North Wales.
ENAMELLED SLATE Chimney-pieces, Billiard Tables, Console and other Table Tops, Mural Tablets, &c., in imitation of marble, surpassing the choicest marbles in beauty and durability, at less than half the cost of the commonest descriptions. Price Lists forwarded on application to Mr. MAGNUS, 39 and 40, Upper Belgrave-place, London.

CUCUMBER AND MELON BOXES AND LIGHTS.
One hundred 1, 2, and 3-light Boxes and Lights of all sizes ready for immediate use. Warranted best materials, packed and sent to all parts of the kingdom; 2-light Boxes and Lights from 1l. 4s. Garden Lights of every description, Conservatories, Green and Hot-houses, made and fixed in all parts of the kingdom. References given to the Nobility, Gentry, and the Trade, in most of the counties of England. JAS. WATTS, Hothouse Builder, Claremont-place, Old Kent-road, London.

CROWN, SHEET, AND ROUGH PLATE GLASS FOR HOTHOUSES, CONSERVATORIES, &c.
The Improved Patent Rough Plate, made by Messrs. Hartley and Co., can be supplied from this Warehouse, of every size and substance, at the same prices as at the works.
100 and 200 feet cases of large Sheet Glass, from 2½d. per foot. Small ditto, 10s. 6d. per 100 feet, packed in boxes ready for immediate delivery. Curators of Botanical Societies, Florists, Railway Agents, and others requiring large quantities, will, on sending dimensions, receive estimates at the lowest prices.
GLASS MILK PANS, CREAM POTS, Lactometers, Bee Glasses, Fish Globes, and all kinds of Dairy Glass, Propagating Glasses, Hyacinth Dishes, Cucumber Tubes, and every other description of Garden Glasses.
PATENT GLASS PENS, self supplying, never blot, never soil the ruler, and will write continuously for 12 hours.
Also, Glass Rulers, Glass Inks for office-stands, desks, &c. Stationers and Schools supplied. Wholesale Warehouse for Ornamental Shades, Lamp Shades, Gas Glasses, Genuine White Lead, Paints, Colours, and Pumps for Farm purposes.
Our Catalogue of 18 folios is the most complete ever published. No Gardener or Farm Bailiff should be without one. May be had Gratis on sending two postage stamps to Messrs. COGAN and Co., 48, Leicester-square, London.

CHOICE CALCEOLARIA SEED.

J. HENCHMAN begs to announce that his choice CALCEOLARIA SEED, saved from superb varieties, is now ready, at 2s. 6d. per packet. The attention of the trade is also invited to his stock of above 10,000 strong Seedling CEDRUS DEODARA, which he offers on very advantageous terms.—Edmonton, Middlesex, Aug. 24.

HYACINTHS, ANEMONES, JONQUILS, TULIPS, IRISES, CROCUSES, &c.—Carriage free, as see below.

JOHN SUTTON AND SONS, Reading, Berks, having for many years imported Bulbous Flower-roots extensively from several celebrated Florists in Holland, they are well acquainted with all the most desirable kinds of Hyacinths, Tulips, Anemones, and other Bulbs, cultivated near Haarlem, and are also enabled to secure the finest quality of Bulbs at the Dutch market prices. An immense assortment is just imported direct from Haarlem, and early orders will be executed with the very best Bulbs, at the undermentioned low prices.

The Gardeners' Chronicle.

SATURDAY, AUGUST 24, 1850.

MEETINGS FOR THE ENSUING WEEK.

COUNTRY SHOWS.—Tuesday, August 27: Handsworth and Lozells Floral and Horticultural.—Wednesday, Aug. 28: Salisbury West of England Dahlia, Warwickshire Horticultural, and Trowbridge Horticultural and Floral.

IN another column will be found the SCHEDULE OF PRIZES offered by the Horticultural Society at their Exhibitions in 1851. The following are among the principal changes.

All FLORISTS' FLOWERS are in future to be shown in pots, and not in boxes, or pans, as cut flowers. This proposal, first made we believe in the "Gardeners' Magazine of Botany," is wholly unobjectionable, and we cannot doubt its meeting with entire concurrence from the growers. It will put an end to the packing and trimming system, by which flowers are so changed that even their owners do not know them; and it will give amateurs a real means of judging of the respective value of the varieties. In this way, too, Pansies are readmitted, after a long and well deserved exclusion, on account of their worthlessness when shown in "pans."

INDIAN RHODODENDRONS and their hybrids are to be shown in twelves, with the same medals as the first class of Chinese Azaleas.

A class of the *newer* CHINESE AZALEAS in twelves, in 8-inch pots, has been formed for the convenience of beginners in the cultivation of such plants.

In like manner a new class of CAPE HEATHS, in sixes, will enable the small grower to show his skill in managing a proverbially difficult race.

In order to improve the quality of the miscellaneous COLLECTIONS OF STOVE AND GREENHOUSE PLANTS, it is determined that in no case shall any exhibitor be allowed to show more than three species or varieties of the same genus, and in the smaller of these collections one species or variety only of a genus is to be admissible.

The measurement of GARDEN POTS is to be made inside, 1 inch below the rim.

COLLECTIONS of FRUIT are restored, with the Gold Knightian and other Medals in May, the Gold Banksian and others in June, and the Silver Gilt, &c., in July; the value of the medals being in this way proportioned to the difficulty of exhibiting. These collections are, however, to be shown with the proviso that no one who exhibits in the collections shall show elsewhere. This will secure the smaller growers against the risk of being swamped by some horticultural Leviathan. Fruiterers are, as before, absolutely excluded from exhibiting.

PELARGONIUMS are to be shown in twelves and nines, instead of sixes.

Considerable alterations in the tables and tents are in progress, so as to meet the augmented extent of exhibition which must follow the changes now decided upon. It is in particular intended that better accommodation should be provided for the large miscellaneous collections; and, upon this subject, the Vice-Secretary would be glad of suggestions, in order that the convenience of exhibitors may be consulted as far as possible.

WE strongly recommend those of our readers who may be sceptical as to the prevalence of the POTATO DISEASE, from any favourable signs about their own crops, not to be too sanguine. The smooth surface of the sea is not more deceptive. Some weeks since we noticed, in a Leading Article, a morbid appearance which existed in our Potatoes about the base of the stems, running down the strings to the young tubers. No great change had taken place up to the time of getting up the crop, two days since, except that some of the very small tubers had completely decayed, passing into mere bags of water. Nothing could be more beautiful than the appearance of the Potatoes when raised; many of them were extremely fine, and all of the larger specimens, with the exception of two only, seemingly without the least taint of disease. A trifling shower fell upon them as they lay between the rows, but they were housed at night perfectly dry. This morning, after the lapse of only 36 hours, there is scarcely a tuber which does not exhibit unequivocal signs of disease, and the whole may be considered as lost. We have not yet had an opportunity of examining the peculiar symptoms exhibited by the infected tubers, but in some diseased Potatoes of the same variety brought to us from a neighbouring crop, the same little mould is present which we observed on the decaying stems in our own garden.

Many sorts of mildew are peculiarly prevalent during the present season, the alternations of heat and moisture favouring their growth in a very injurious degree. It is clear that two distinct diseases are prevalent amongst Potatoes, the one attacking the foliage, which, in many districts is rapidly failing, the other, the lower part of the stems and the smaller tubers, some of which when no larger than Peas we have observed completely decomposed. How far the general produce may be affected it is at present impossible to say, but the appearances are far from favourable. As on former occasions, cultivators seem inclined to refer every affection of their crops to one and the same cause. Some Onions, for instance, were forwarded to us lately, as affected by the Potato disease, from Chichester, and precisely the same malady is affecting them at Bath, the foliage gradually fading, and the bulbs presenting a fœtid mass of corruption. The disease is, indeed, in the first instance, due to a species of *Botrytis*, figured by Mr. BERKELEY, in the sixth volume of the "Annals of Natural History," under the name of *B. destructor*. The spores are far longer than in the Potato *Botrytis*, the threads of a pinkish grey, and there are no swellings towards the tips of the branches. The leaves soon assume a sickly tinge under the influence of the mould, and, as a natural consequence, the juices stagnating in the half-ripe bulbs, decomposition rapidly takes place, perhaps aided by the growth of the spawn of the mould within its cells. Meanwhile, as the foliage begins to wither, another mould, which appears to be identical with *Macrosporium Cheiranthi*, grows on the decaying leaves, distinguished by its dark olive-black threads and many-celled spores, the structure of which will amply repay a microscopical examination. This second mould, it should be observed, has nothing to do with the disease, but is simply a case of growth on matter already more or less decomposed, whereas the Botrytis attacks the green leaves, and evidently causes their destruction, and ultimately that of the bulb.

ON Saturday next, the 31st of August, will take place, throughout Great Britain and Ireland, the WORKING-MEN'S SUBSCRIPTION FOR A MEMORIAL OF THE LATE SIR ROBERT PEEL. Certainly, no class of men has derived greater or more lasting benefits than gardeners from the enlightened policy of that lamented statesman, and we trust that the amount which they may contribute will form no unimportant item in the sum hereafter to be announced. In common with every other class of workmen they have to thank Sir ROBERT PEEL for the final removal of that most oppressive of all impositions, the tax on bread; and they owe him an especial debt for the total repeal of the glass duties—a relief in itself of immense value to themselves, and of still more importance as the beginning of a great system of financial reform, already succeeded by the destruction of the duty on bricks, and no doubt to be followed, as the revenue improves, by a series of other measures of a similar nature. That the food tax was destroyed was wholly owing to the courage and self-immolation of Sir ROBERT PEEL; that England stands where she is, safe amidst the political tempests that have surrounded her, may be justly attributed to the same great man; that Englishmen are able to feel that what they do possess is secure, be it much or little, is his work; and the amount to be raised next Saturday will, we trust, show that the poor at least are grateful to their benefactors.

We have no means of knowing in what manner the fund thus to be raised will be appropriated; but we think the committee is composed of men whose character is a guarantee that it will be applied in some permanently useful manner, and not in the erection of monuments, and columns, and statues. Such vanities were despised by Sir R. PEEL during his life, and repudiated at his death. Peerages and public monuments are not for men like him. He loved what was useful; he sacrificed himself to the public advantage, and, of a surety, that which shall be the most generally and permanently beneficial is that which he would have wished for, could he have suggested it.

A working man's memorial is the greatest monument that can be raised to him, the highest compliment that could be paid to his memory; let it be worthy of THEM and of HIM.

The subscription will be one penny, *or any higher sum* which the means of the subscribers may permit. For the information of those who require information upon the subject, we give insertion to the following notice, which has been circulated by the central committee:

At a public meeting, held in the Great Room of the Whittington Club (late Crown and Anchor Tavern), Strand, on Wednesday evening, August 7th, JOSEPH HUME, Esq., M.P., in the chair, the following resolutions were adopted:

1. "That this meeting recognises with gratitude the benefits which, at great sacrifices to himself, were conferred upon this country by the late Sir ROBERT PEEL, and has seen with satisfaction the spontaneous disposition amongst the industrial classes to raise a fund for the erection of a durable memorial of his services, and pledges itself to give all the aid in its power to carry that object into effect."

2. "That this meeting recommends that preparations be made for a simultaneous collection, on the same day, throughout the United Kingdom; and that Saturday, the 31st of August, be the day for such collection; and that all contributions be paid into the Bank of England, to the names of the trustees, and the accounts closed in the month of September next."

3. "That JOSEPH HUME, Esq., M.P., be Chairman; Sir JOSHUA WALMSLEY, M.P., Honorary Secretary; and the following gentlemen members of the Central Committee, with power to add to their numbers:—John Masterman, Esq., M.P.; Sir James Duke, Bart., M.P.; Alderman Copeland, M.P.; Richard Cobden, Esq., M.P.; William Brown, Esq., M.P.; Sir James Graham, Bart., M.P.; John Bright, Esq., M.P.; James Wyld, Esq., M.P.; George Thompson, Esq., M.P.; Charles Lushington, Esq., M.P.; George Carr Glyn, Esq., M.P.; Newton Finch, Esq.; William Williams, Esq., M.P.; Mr. Sheriff Lawrence; Mr. Sheriff Nicoll; T. S. Duncombe, Esq, M.P.; Alexander Mackimon, Esq, M.P.; James Yates, Esq."

For the purpose of carrying the above resolutions into effect, the central committee earnestly recommend prompt and energetic action in the provinces. In all corporate towns a requisition should be forwarded to the chief magistrate to convene a public meeting. Committees should take the means necessary to afford working men in their localities the opportunity of sub-

scribing. This may in part be done by proper exertions in factories, workshops, and other establishments. A systematic effort should be arranged for the simultaneous collection on the 31st instant. All moneys should be forwarded, either direct to the Bank of England to the account of the trustees of the Working Man's Peel Memorial, or to Joseph Hume, Esq., M.P., at the above office.

Every information required for the furtherance of the object in view, may be obtained by application to the Hon. Secretary, at the office, 454, West Strand, London.

Dr. Lindley will now be glad to receive, with as little delay as possible, the communications of those correspondents who propose to contribute to the next Number of the "Journal of the Horticultural Society."

HOW TO MISMANAGE A GARDEN.

Chapter III.—Twin brother of Procrastination is Disorder. It is hard to say which deserves the higher rank in the art of mismanagement. If putting off has the advantages already pointed out, want of method increases them wonderfully. Disorder usually indeed accompanies procrastination; for it may be generally observed that the man who finds himself behindhand, sets to work helter-skelter, with a vengeance, when he does begin.

He who puts off is always behindhand; he who is behindhand is always in a hurry; and he who is in a hurry, is always in confusion. By this you may easily know the mismanager. He is behindhand and in disorder, because it enables him to show the skill that is in him when it is perceived how much he can do in "no time," and "any how," when he sets about it. Dr. Johnson, or some other sage, used to maintain that that was always best done which was quickest done. The parent of this maxim may therefore be held answerable for the prevalence of disorder; for helter-skelter is a sign of activity, and activity denotes quickness—which is the virtue insisted upon.

Observe the great mismanager; how he shines when you find him "drove into a corner." How he orders his men about! how his personal activity becomes conspicuous! Twenty directions are given in 10 minutes; the men run here, rush there; one is digging borders, another is trampling them down again while pruning the trees; a third begins to mow, but there is no scythe stones; away runs a fourth to find one; it is found; sweep goes the scythe over the Grass; the scythe is wrong set; the last time it was used was in the hay-field. "Put it to rights." "At it again." "Ah! the Grass wasn't rolled." "Where is the roller?" "Oh! in the stable-yard." "You, Tom, go and fetch it." "No roller is there; it is lent to a neighbour." "Never mind, we will do without it." Sweep, sweep, scrape, scrape, goes the scythe-blade; the Grass is stubborn; the worm-casts take off the edge; gravel-stones are all over the lawn. "Why, where is the broom?" The broom is brought; it is only a stump. "Well, that will do;" and so the work proceeds. "Why, who has been a stamping down the borders? Here, Joe, you rake off these cuttings, and put out the foot-marks." The ground is again made trim. "Well, but where are the Geraniums that were to be put out here? Peter and Sam just get a hand-barrow and fetch a lot from the potting ground." Away run the men; the door is locked. "Where's the key?" Nobody knows. "Well, then, Peter, you get over the gate, and hand the pots over the top to Sam, who'll stay on this side." Peter scrambles over; the gate is too high for him to reach over it; he looks about for a wheelbarrow to stand on; mounted on this he hands the Geraniums to his partner; but Sam is clumsy, and don't understand being put out of his way; down goes the pot; the best plant of the lot, a famous Tom Thumb in full flower, is knocked to pieces. No one can deny that a scene like this is exciting; it shows what energy and resources are at the command of the man who is in confusion. The dull, methodical fellow, who keeps his tools in their places, and takes his work in proper order, and who has no occasion to do it two or three times over, is no more to be compared with such a luminary as has just been pourtrayed, than a planet with a comet, or, to use a more homely comparison, than a Rose with a red Cabbage.

Surely, it is a frivolous objection to disorder to say that it makes everything consume two or three times as much labour as order would have required. That is precisely its merit; for does it not diminish poor-rates? and secure a comfortable living to many a poor man who would otherwise be put to his wits to exist?

Nor can it be admitted that a garden in disorder is a disagreeable object; on the contrary it is a pleasant relief to the monotony observable in ordinary places, and moreover it is an imitation of Nature, who we are told should be our guide in all things. Who ever saw anything like order in a forest? or on a common? or in a thicket? or in rocky ground? There is no order in these places; quite the contrary; and therefore a garden in order is altogether an unnatural sight—which it ought not to be.

There are persons who carry their ideas of order to a very extravagant point; they think that in the tool-house the tools should be all placed where they can be found in a moment; that in the seed-room everything should be regularly arranged in drawers or boxes, so as to prevent intermixture; that seed-papers after being opened should again be tied up or folded carefully; that there should be a shelf for books, and a desk for papers, and a file for accounts; and they even go so far as to maintain the necessity of the composts and crocks in a potting shed being kept in distinct bins. They say that the mere habit of attending to these things introduces economy and good management in other and very different matters; that it also improves a man's way of thinking, and teaches him to use his reason better. But a good mismanager should believe nothing of the sort; he should consider how much trouble it takes to get used to such ways; and as to their saving time in the long run, that is a contingency far too distant to be reckoned upon. "Enough for the day is the evil thereof." The mismanager, when he has done with his tools, will throw them in a heap, in the garden, or the yard; it is of no use to carry them to the tool-house. Very likely he may want to use them the next time in the place where he left them; and if not, he will know where to look for them. What harm is there in their standing in the rain? The wheelbarrow is painted; and the tools are of iron; and it will take a "precious sight" of leaving about to hurt *them*. As to seed-papers, and all that, why what matters it if a little seed is spilt; and if they get mixed "it don't signify, for one can always find it out when the seeds come up." Books and papers and pens and ink! What can be the advantage of keeping them in order? A mismanager has not so many of them; he can generally find what he wants without the need of such precautions; and if he should mislay a letter, or a bill, or any other papers, why perhaps he can get them again, or if not, he can console himself with the reflection that "mistakes may be made by anybody." Compost bins, and all conundrums of that sort are contemptible; they are very well for Lady Antrobus, or Mrs. Lawrence, or Mr. Rucker, or the great London growers, but to a mismanager they are mere trouble without profit. In fact, he gets on just as well if he mixes his soils all together and leaves them out of doors. Such trifles in no way affect the success of *his* operations. Κῆπουρος.

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

Thursday, *Aug.* 1.—In the Chemical Section Dr. Daubeny gave a statement of the progress of his experiments on the influence of carbonic acid on the growth of Ferns. It will be remembered that this subject was taken up to test the probability of the theory, that the excessive development of vegetation during the coal period depended on an abnormal quantity of carbonic acid in the atmosphere. In a series of experiments, performed last year, it was found that excessive quantities of carbonic acid injured Ferns. Dr. Daubeny stated that the Ferns were now growing in an atmosphere containing one per cent. of carbonic acid in excess above that ordinarily contained in air; and although it was thought that similar Ferns growing under the same conditions, but without carbonic acid in excess, were the most luxuriant—it appeared that they thrived well in this artificial atmosphere.—Mr. R. Hunt, who had also been requested by the Association to experiment on the subject, explained that he was not prepared to furnish a report at this meeting, owing to the great uncertainty which appeared to surround the inquiry. He stated that he found the diversified influences of light materially to affect the quantity of carbonic acid which the plants could absorb without immediate injury. He would still pursue his investigations, and he hoped to arrive at something more definite by the next meeting. On the same day, in the Natural History section, a paper was read *On the Hedge Plants of India, and the Conditions which adapt them for special purposes and particular localities*; by Dr. Hugh Cleghorn, H.E.I.C.S.—The author alluded to the improved face of the country over large tracts of Southern India, arising from the bridging of rivers, the formation of ghauts, the abolition of transit duties, the extension of made-roads, the better construction of labour-carts, and the completion of various public works; but adverted with regret to the still backward state of Indian agriculture, and the abject utilitarianism which characterises field operations, expressing the hope that ere long the lands will be more generally manured, the fields enclosed, the roadsides fenced, additional tracts cultivated, and English improvements extensively introduced into Hindostan. The Peninsular flora is remarkable for the great prevalence of thorny shrubs and prickly plants; yet, supplied with such materials for hedge-making as few countries possess, India exhibits often wretched enclosures, in many parts none at all. It is universally admitted that the bleak and barren districts stand pre-eminently in need of these appliances, for the development and preservation of their agricultural resources, which suffer greatly from the depredations of wild animals and stray cattle. The Cactæ, Agaveæ, and Euphorbiæ are adapted to the arid districts, their hard epidermal coverings enabling them to resist evaporation, and to flourish when refreshed with only occasional showers; the Mimoseæ and Cæsalpineæ seem to enjoy the more cold and moist climate of the Balaghaut district, whilst the Bambuseæ and Pandaneæ luxuriate with native majesty in the rich loamy soil of the Mulnaad (*i.e.*, rain country). Hence, were a railway to traverse the Peninsula, the fences ought to differ as the line is continued through various districts, in accordance with those conditions under which particular plants thrive best between certain limits of temperature and moisture. The following list of plants observed in use, or calculated for the formation of hedges, was appended to the paper, with vernacular names, and such observations as to habitat, mode of cultivation, &c., as might aid in the selection of species or afford information upon the question of local applicability:

I. Hedge Plants.

Opuntia Dillenii, Haw.	Epicarpurus orientalis, Blume.
Agave americana, L.	Jatropha curcas, L.
Euphorbia Tirucalli, L.	Pisonia aculeata, Rox.
,, antiquorum, L.	Capparis sepiaria, L.
Cæsalpinia sepiaria, Rox.	,, aphylla, Rox.
,, Sapoan, L.	Scutia indica, Brong.
Pterolobium lacerans, R. Br.	Azima tetracantha, Lam.
Guilandina Bonduc, L.	Gmelina asiatica, L.
Parkinsonia aculeata, L.	Balsamodendron Berryi, Arn.
Poinciana pulcherrima, L.	Toddalia aculeata, Pers.
Mimosa rubicaulis, Lam.	Bambusa arundinacea, Willd.
Inga dulcis, Willd.	,, spinosa, Rox.
Acacia arabica, Willd.	,, nana.
,, concinna, De C.	Dendrocalamus Tulda, Nees.
Vachellia Farnesiana, W. & A.	Pandanus odoratissimus, L.

II. Ornamental Plants, forming inner Fences.

Lawsonia inermis, L.	Adhatoda Vasica, Nees.
Lonicera ligustrina, Wall.	,, Betonica, Nees.
Citrus Limetta, Riss.	Graptophyllum hortense, Nees.
Morus indica, L.	Gendarussa vulgaris, Nees.
Punica granatum, L.	Gardenia florida, L.
Phyllanthus reticulatus, Poir.	Allamanda cathartica, L.
Hibiscus rosa sinensis, L.	

III. Plants used for edging Garden Walks.

Pedilanthus tithymaloides, Poit	Rosa indica, L.
Vinca rosea, Willd.	,, semperflorens, Curt.
Heliotropium curassavicum, L.	

Professor Royle considered this paper a most valuable one, and thought its title by far too modest for its merits. The importance of considering the adaptability of plants to particular soils and climates could not be overrated in all attempts at developing the resources of a country. Plants which would flourish in a rich alluvial soil would not grow in a sandy plain, and *vice versâ*. It was not always the case that indigenous plants were best adapted for culture in particular countries, and in India they had many instances of introduced plants growing more vigorously, and extending more widely, than native plants. Some botanists had expressed doubts with regard to the plants introduced from the New World into Hindostan, because they had old Sanscrit names, but it was frequently the case that new plants were called by the natives by some old name.

VILLA AND SUBURBAN GARDENING.

It is an important point with almost every one who cultivates Strawberries to have them early. Early-forced Strawberries are highly esteemed; and though the means of producing them may be but limited, still most people who possess a garden, and a little glass, make an attempt at forcing them. For very early work the first runners should be secured. These may be pegged down on small 3-inch pots, and, when fully established, removed from the parent plants and repotted into 6-inch pots, using rich loamy soil. Instead of the common practice of placing these pots behind a wall or hedge, on a north aspect, let them be plunged in the full sunshine up to their rims in coal-ashes or old tan. All runners which are made during the current autumn should be removed on their first appearance, and let the plants be watered once every week with liquid manure. Under such treatment they will have attained a highly matured condition by the approach of winter, and will be capable of producing an early spring crop.

As soon as the growing season is over, the pots should be taken out of the material in which they were plunged, and placed on their sides, to prevent the access of water. In order the more perfectly to effect this end, a quantity of old tan, sand, sawdust, or coal ashes should be provided for stacking them in. A dry situation should be selected for the purpose; the pots should then be placed upon their sides in two rows, the bottom of the pots facing each other, and the rims placed at the outer edge of the stacking material. The space between the pots should be filled up level with the tops, and another tier of pots added, until the ridge is 3 feet high. To throw off the wet, a covering of straw should be secured on the apex of the ridge. In severe weather the whole ridge may with facility be protected, and this will be the more desirable where a succession of forced Strawberries is required, as a portion will require to be put in the forcing-house or pit every fortnight; and this could not be done, under favourable circumstances, if the frost is allowed free access to them.

The above practice is only recommended for the earlier crops; for later ones it is not required. One of the largest growers of forced Strawberries for the London market never pots the later crops for forcing

until they are wanted for that purpose. His success is beyond question; but then old plants are never chosen. Young plants, about a year bedded out, are such as he selects; a great amount of trouble and expence is thus saved. This cultivator has been equally successful in forcing the same plants two seasons consecutively—a practice not generally followed. *Pharo.*

Home Correspondence.

Mildew on Grapes, &c.—Since my last communication I have collected further information on this subject, both by investigating various plants, as well as by referring to some of our best authorities upon the subject. The Grapes in my house are mostly spoiled, but the effect of the mildew is different upon different varieties, all those with white berries being least affected—the Sweetwater least injured of any; Muscats next; the Black Prince less injured than other dark-coloured varieties, while all the Hamburgh are destroyed. The disease has now extended to those on open walls, but the white Sweetwater is least affected. In a house recently erected, and in which Vines were planted this spring, the leaves had become slightly affected. Sulphur was dusted on and appeared to arrest the progress of the disease, but did not cure it. I have had fermenting horse-dung turned in, which has produced so much moisture that I find the disease has entirely disappeared. This is a step in the right direction, as it may serve in following years as a means of preventing this destructive pest. In pursuing the investigation, I have found that the mildew upon the Pea, the Grape, and the Rose is, so far as I can find, the same, Acrosporium monilioides; it is most rapid in production, and is communicated by its seeds to other plants. It appears to lie or grow upon plants, and when found upon Grapes appears like finely-powdered wood ashes; but upon examination with a microscope of highly magnifying power has the appearance as described in my last article, sometimes connected in clusters, similar to bunches of Grapes, or shooting out from each other like beads in a necklace; it is stated to lie only on the Grapes or plants, but a close examination shows it to be attached, as considerable discolouration appears upon the skin of the white Grapes after its removal; and upon removing it to other substances, it throws out small filaments, which hold those little band-like substances together, and by which it doubtless attaches itself to other plants when first transplanted; but those filaments are so extremely minute, that I have not yet found it possible to distinguish whether they are roots or not; before its first appearance upon the upper sides of the leaves of the Grapes, it is white and fibrous, like mould; but on submitting this substance to a very high magnifying power, it appears to consist of little cones of some fine substance, so exceedingly minute in its divisions as to defy the eye in discovering its constituent parts, and still appearing, when thus highly magnified, like specks of hairy mould, and composed of filament only—white, and not unlike, in general resemblance, the very fine cotton used by jewellers. No doubt remains that it is a parasitic fungus, and that it proceeds through all its various stages of development to perfect growth, and production of its seeds, which are communicated from plant to plant by the air, and under certain conditions of atmosphere, and of the plants to which it is communicated, continues to vegetate and prolong its species; but as we find all the larger classes of parasitic fungi grow more luxuriantly or entirely on plants in a debilitated or diseased state, it is to be inferred that these minute fungi vegetate only under the same conditions, and that therefore their appearance indicates previous disease in the plants attacked by them; and taking this view of the question, it is found with most vegetables, especially with the Pea, that it mainly arises from a deficiency of moisture at the roots, and I have seen it prevail most frequently in very dry autumns, especially in seasons when moderate dews prevail. Mr. Knight supposes that plants under such circumstances derive their chief support by absorption of moisture through their leaves, and that the flow of the sap is in some measure downwards, and that a continuance of this process produces a vitiated state of the sap and sap vessels, and consequent debility of the plant, and it then becomes open to attack of this or other parasites. One thing is certain, that if Peas are subjected to frequent, regular, and copious watering, they are not attacked by mildew; and it is stated by Loudon, that in Scotland, where there are heavy night dews, that this description of mildew is unknown. Also in situations well ventilated it prevails less extensively than in places where a confined circulation of air takes place, and even in hothouses partially shaded by surrounding buildings, it appears to attack with greater virulence than in those more open and better ventilated. It appears, therefore, that certain conditions of atmosphere, moisture, situation, and management, combine to its production; therefore I consider that free and copious watering at the roots, a full ventilation and copious watering of the house, as well as by syringing the plants towards evening, would tend especially to counteract its influence. But to be effectual, this system should be adopted as a preventative rather than as a cure, for when it has once become established, it is very difficult to arrest its progress, Vines having been thoroughly washed with a solution of corrosive sublimate, and afterwards with a coating of fresh lime, without the least apparent beneficial effect; and, so far as I can find from the statement of others, sulphur also has little effect in destroying it; where it has prevailed once it has returned again the following season, and I find that unless all the sashes and lights are removed and thoroughly washed with strong lime-water, brine, or corrosive sublimate, in the proportion of half an ounce at least to 1 gallon of boiling water, that its return may be expected as almost certain; but, in addition, it would be well to paint the whole of the inside of the woodwork, and to lime-wash all the brickwork of the building as a preventative, and I suggest that the Vines should be cut back as closely as possible, and every part be thoroughly washed with lime water, and then painted over with hot fresh slaked lime mixed with water. I offer these remarks with some degree of hesitation, not having fully tested them myself; but it appears that the treatment should be similar to that adopted in dusting Wheat for preventing the smut—Uredo segetum. No application is found so destructive to this fungus as the blue vitriol, and probably it may be found equally efficacious in this. I throw out these suggestions to the consideration of others. No direct attempts that I know of have at present been made to rid us of this pest; but in the case of the one affecting the Wheat, a remedy is applied, which is in most cases effectual. Much has been said of the Berberry shrub becoming invariably infected with and communicating the mildew to growing Wheat and Rye, for which see an elaborate account in the first part of vol. vii. of "Communications to the Board of Agriculture," as communicated by L. E. Windt to Sir Joseph Banks. The evidence there adduced was so conclusive that an act of the legislative assembly was passed directing all Berberries to be rooted up throughout the principality. But Loudon states it is a different description of mildew that infests the Wheat from that produced on the Berberry, and therefore denies the possibility of infection being carried on by its instrumentality to the Wheat plants. In corroboration of the communication of M. Windt, I am enabled to state that for many years together I have observed mildew affect Wheat opposite Berberry bushes in fences, shading off in degree as the distance became greater, and upon one occasion, after the Berberry bushes were supposed to have been eradicated, mildew was discovered, and upon making diligent search a Berberry shrub was discovered, having sprung up from the roots of the old plant. *Robert Baker, Writtle.*

Mildew on Parsnips.—I enclose for your inspection leaflets of the cultivated Parsnip attacked by a minute fungus, concerning which I wish to be edified. Persons who really know nothing at all about such matters, and judge only from unassisted eye appearances, say that the affection is identical with the Potato disease. *Pastinaca, August* 20. [The fungus appears to be a species of Botrytis, but not the same species as attacks the Potato.]

Musa Cavendishii, or Dwarf Banana.—Probably this is the farthest north part of the kingdom in which the Musa Cavendishii has ever ripened fruit. I therefore send you a specimen, to enable you to test its quality. Three years ago I was instructed to get a small plant of this Musa, and as our stove is very low in the roof, I was not sure but what it might go through the glass by giving it much pot room. However, early in the spring of 1848, I resolved to give it more root room. I planted it in an old cask 2 feet across the mouth and 2½ feet in depth, using strong turfy loam mixed with flakes of well rotten dung, and at the same time removed all suckers. I secured good drainage, as I found it delighted in plenty of water, and syringed it well in hot weather. The temperature of the house was kept at 65° in the day time and 50° at night. In a few weeks it began to throw up large dark green leaves, which had a beautiful effect among the rest of the plants, such as Polypodium aureum, and the like, with drooping habits. In September 1849, it began to show its flower-stalk, and in a few days afterwards a large cluster of fruit appeared in sight, which swelled on progressively till it became ripe. It is much esteemed for dessert. The height of the plant is 4½ feet, and the circumference of the stem 19 inches; each leaf measures 5½ feet in length and 2 feet in breadth. The number of pods that formed the cluster was 85, their united weight being 36 lbs. No one having the command of a Vinery should want a plant or two of this Musa. Its effect is fine under the foliage of Vines; and its fruit useful. It is much more deserving of a place in a Vinery than many other favourite plants we see some gardeners growing, or rather trying to grow, in a high temperature, harbouring red spider and other enemies to Vineries. The plant in question was never subjected to a higher temperature in winter than 40°, and in the summer time from 70° to 80°, with all the air that could be given. At times this Musa may be induced to fruit in 18 months under a very high temperature, but neither the quality nor quantity is so good, and the natural form of the plant is lost. *John M'Pherson, J. Pourie's, Esq., Reswallie, Forfarshire, Aug.* 5. [The fruit was excellent.]

Exhibition of 1851: *Flower-pots.*—Amongst the things enumerated as preparing for next year's great exhibition, I hope that flower-pots will not be forgotten; for if the improvements are successful, they will be more generally distributed than any other article. I see that others of your correspondents are interested in the subject, and the remarks contained in your paper of July 27th are deserving of attention by those who are manufacturers and designers of pottery. Dark colours will be found to harmonise best with plants which are supposed to be natives of warmer climates, and therefore all pale neutral tints should be avoided as exciting chilly ideas. The Etruscan colours would look well, especially upon a fine material. Scarlet or deep orange, buff and black; and perhaps some hints of shapes might be taken from those masters of the fictile art. For a commoner kind, and for those who still adhere to the notion that pots should be porous, I would recommend that they should be made of the same ware as at present (if it will not take glaze), smoothly glazed as far as three-fourths from the top with a warm brown or even a black glaze, the rest being left of a bright red, which would surely allow enough for drainage. The division of colours should be clearly and accurately marked by two or three lines; the lower end should be furnished with a projecting rim; the bottom should be separate, and pierced with holes like a kitchen colander, and should rest at least an inch from the ground in the inside, and be slightly concave on the upper surface. These surely would not be much dearer than the pots in present use, and certainly cleaner and less flaming. The shapes, perhaps, are as convenient as they can be. For superior articles, with a little study they could be produced so as to be elegant and ornamental, yet not too fanciful or attractive; for it must always be kept in mind that they are to be subordinate to the plants. Old pictures of interiors, particularly Dutch-Chinese patterns, in addition to new ideas, would furnish examples. Could gutta percha be applied for pots or cases for in-door use? The soft brown shades of many of the articles made of it is very agreeable to the eye, and the substance is far preferable to porcelain, on account of the brittleness of all fine pottery. *Amateur.*

Creosote a Preserver of Wood from Sea-worms.—Some time ago one of your correspondents requested information as to the means of preserving wood from the ravages of sea-worms. It is not generally known that some experiments made last century in Plymouth Sound pointed out that timber when paid with cheap oils remained intact, though other pieces of it sunk in the same place were much worm-eaten. Oil of tar was, 40 years ago, recommended for paying timber intended for a work in the same Sound, and latterly creosote, or oil of tar, has become of very general use for the protection and preservation of wood in bridges, railway sleepers, &c. Creosote is the cheapest of all oils, but for some purposes its application is objectionable, since it renders wood so highly inflammable that insurance offices refuse to insure any works impregnated with it, and its noisome and long-enduring smell render its use improper in various instances, such as in structures for horticultural purposes, for example. Where the latter disadvantage may be considered as prohibiting the use of creosote, cheap oils free from smell, as whale oil, would probably be equally effectual in preserving wood from sea-worms. *M.*

Stripping Fig Trees and other Plants of their Leaves.—I have been a gardener these 60 years, and am reported to be a good Fig grower. About this season I nail in the young growths, cutting none away except those whose position will not allow them to be fastened to the wall. Where the leaves are very numerous, and shade the fruit, I thin them out, a practice I have pursued with advantage, more especially where the Figs have been shaded by other trees. It not only improves the fruit, but the wood, from being exposed to the sun, gets ripened before frosts set in, and winters well. But the removal of the leaves is a point on which I and my younger brethren (saplings) disagree. The latter stick to theory, allow all the leaves to remain on, lose their young wood in the winter, from its being ill ripened, and have late crops, while my wood keeps firm and sound, and matures good crops every year. What is your opinion with respect to the removal of Fig tree leaves? *An Old Gardener.*——My gardener, according to an old custom inherited from his father, has stripped off almost all the leaves from my Fig tree, with the view of accelerating the ripening of the fruit, by exposing them more fully to the sun's rays. Will you be so good as state whether he is justified, either by nature or reason, in the commission of such an act; and whether he does not materially injure the tree with regard to its bearing next year, by retarding the ripening of the young wood, and by depriving it of the nourishment which I have always understood a plant derives from its leaves. He has also mown off all the foliage from the two-year-old Strawberry-beds. I consider this act also detrimental to the plants. Should he have acted improperly, I should like to convince him that such is the case by showing him your reply. *A. B.*—[Leaves in a healthy state should not be removed, unless with a view to making those which remain healthier and better. When leaves are old, and begin to change colour, they are of no further use, and may be removed without impropriety. Figs ought not to be grown in shady places.]

Scientific Names.—I have just been reading "Rural Hours in America," by Miss Cooper. In pages 55 to 60, first volume, I found observations similar to your own on names in botany. Miss Cooper ridicules the nomenclature in use with a good deal of humour. I think it will be pleasing to yourself to find a corroboration of your sentiments on the subject in so recent a work. I hope also that it may assist the cause of plain and universal terms in books of science. The coincidence between you and Miss Cooper shows the general and growing aversion to be treated with the dead letter instead of the living language in the science of botany. *Correspondent, Oxon.*

Monstrous Cucumber.—In passing down Exchange-street, Norwich, the other day, I observed a Cucumber full 15 or 16 inches in length at Mr. Ewing's seed esta-

blishment, with a full sized leaf growing from its middle. Are such monstrosities common, and to what causes are they to be assigned? *J. Butcher.* [This circumstance is not uncommon. The cause is supposed to be the growing of a leaf to the side of the Cucumber at the very moment when they were first formed in the bud.]

House-bugs and Ants.—Your columns have recommended the getting rid of bugs, and certainly extreme cleanliness alone will effect this desirable purpose; besides this, in some warm countries it is a common practice to destroy these noisome insects by pouring quite boiling water on the parts of furniture infested with them. In this way a first operation may not always be sufficient, but it is easily repeated until all the insects and their eggs are destroyed. Furniture and places the most infested with them may be speedily cleared by solutions of either corrosive sublimate, or of sulphate of copper. Corrosive sublimate leaves no stain after its application, and therefore would be to be preferred, were it not extremely poisonous, and its use is the more dangerous as its solution is colourless. Sulphate of copper is also a poison, but only when taken in considerable quantity; it has been employed with the most complete success for washing old walls, ceilings, floors, and furniture swarming with bugs. The mode in which it was used was to put a few ounces of sulphate of copper into a basin, pouring upon it soft water, stirring the whole occasionally until the whole solution became saturated; a small quantity of the sulphate remaining undissolved indicates that the solution is saturated. Has corrosive sublimate in solution been tried for the destruction of ants in dwelling houses? A strong lessive from wood ashes was some years ago resorted to to get rid of a small species of this insect, and was found to dislodge them from the apartment they had invaded. In the south of France oil of Juniper berries, called in the patois of the country *huile de cade* is frequently used in granaries to protect the corn in them from ants. For this purpose the oil is sprinkled on bare parts of the granary floor, but occasional renewals of the oil are requisite. It is also often mixed with the earth in preparing the *aire* on which corn is threshed, and in houses ants have been dislodged by *huile de cade* being put into the crevices of floors, and at their junction with the walls. *M.*

Potato Disease.—In this district (Grosmont, Yorkshire), the disease is spreading in all directions, and in many places with great virulence. Wherever the land is wettest, it is most apparent. I mean on particular spots in the same field. Thus, one field near me, undrained, but with a considerable slope towards the north, not a wet piece of land generally, a week since had not a green blade over three spaces of curvilinear form, nearly in contact with each other, which must be likened to very shallow irregular shaped basins of 40 or 50 yards in diameter. Elsewhere in the field the plants were all affected, but comparatively only slightly so. Again, in another field lying on land through which two drains had been driven, and, in the occupier's opinion, sufficiently dried the land, though it prevailed over the whole field, as must be seen on looking closely at the plants, yet here and there it was strongly apparent. In these spots I saw Equisetum sylvaticum growing. In my own garden I first detected it on the 5th, among some white Potatoes, what are called here "Golden Drops." They are on soil that has been well drained, 3 feet deep, dug 1 foot or 13 inches deep, and then increased in depth from 7 to 18 or 20 inches by the superposition of soil brought from other parts of the garden. Here, where the land is virtually subsoiled to a depth of 25 inches on the average, it has, to appearance, scarcely extended its ravages on the bine at all during the 11 days which have elapsed since I first observed it. In another part of the garden, set with Early Oxfords, and a local early light purple Potato (which I never saw elsewhere, nor have heard named, but is an excellent Potato, and I think, from experiment, earlier than the Ash-leaf), the disease is making rapid progress in the bine, but so far the tubers are almost entirely unaffected. Indeed, I have not taken up a rotten Potato this year, nor even one that I could decidedly pronounce diseased. These latter named Potatoes were set in October, and are, as it seems, the most diseased in the garden. I have others; Chalmont and Sheeptail Kidneys, Regents, Bishops, American Natives, Red and White Ash-leaves, &c., all more or less affected. In this district the Kidneys always suffer most. In fact, scarcely a Kidney is grown in the parish, except in my own garden. Thirty years since scarce anything but the Pink-eye, Pink-nose, or Painted Lady (for I have heard all three names applied to the same Potato), was grown by any one. Now, no one can grow it. I have tried it two years, contrary to the advice of sundry inhabitants and *quondam* growers, and nine out of every ten plants curled to such a degree, that by the time they were 6 inches high, a very slight gust of wind would snap them off close to the ground. In setting my autumn Potatoes, I tried short stable litter (not manure) against an artificial manure, the basis of which is the refuse Epsom salts of the alum-works. I see no difference as regards disease produced by this difference of treatment; although the patentee seemed, in conversation with me, to anticipate that his manure would act as a preventative to the disease. He grounded his expectation on the fact that some very badly diseased Potatoes being thrown by near his works, a portion of the heap had a quantity of the above-named impure sulphate of magnesia scattered over it. The effect was to arrest the progress of the disease in the tubers so entirely, that the portions of each which were sound when the sulphate was applied, were still sound and good when the remainder of the original heap was little or nothing but a mass of offensive corruption. Is there any correspondence between this result and that of the application of sulphurous acid mentioned in your Number for Aug. 10? *J. C. Atkinson, Danby near Grosmont, York.* Many persons have taken up their Potatoes, although they were not sufficiently ripe. Where the tubers have been stored, they are rotting most rapidly, and in a brief space of time there will, in all probability, be no sound ones remaining. I have this day seen some in a very sorry condition; they are a sort that are named here Early Seconds, and were nearly ripe when taken up. I am anticipating some information from you respecting some diseased Onions which I sent you. The bulbs are fast rotting, and emitting a most offensive stench. Strange to say, the Mignonette, which usually thrives much in the same garden, is all of it withering away, and, as it seems to me, under the same influence. The prevalence of the disease among Carrots, Parsnips, &c., is unmistakeable. I inclose some young plants of the Mignonette. *W. Watkins, Chichester.* [They are diseased; but whether in the same way as Potatoes does not appear.]

Societies.

Caledonian Horticultural, *August* 3.—Stove and Greenhouse Plants: 1st, Mr. Ritchie, gr. to W. M. Innes, Esq., for Æschynanthus pulcher, Balsamina repens, Cuphea platycentra, Begonia violæfolia, Zauschneria Californica, and Calosanthes coccinea. Achimenes: 1st, Mr. Ritchie, the kinds being A. grandiflora and patens. Fuchsias: 1st, Mr. Walker, gr. to J. Wood, Esq., for Nicholsii, Exoniensis, and Dr. Jephson. Roses: 1st, Mr. White, gr. to J. Russell, Esq., for Mrs. Bosanquet, Madame Desprez, Coupe de Hebé, Ne plus Ultra, Charles Duval, Paul Joseph, Aqueline Celline, George's Cuvier, Paul Perras, Viscomtesse de Cazes, Boule de Nantieul, and common Moss. Carnations: 1st, Mr. Henderson, gr. to C. K. Sivewright, Esq., for Duke of York, Favourite, Count Pauline, Lord Pollington, Lady Gardiner, Ely's No. 6, Hero of Middlesex, Lord Lonsdale, Earl Spencer, and Princess Charlotte. Picotees: Ditto, for Duke of Newcastle, Masterpiece, Juliet, Lady Chesterfield, Lady Alice Peel, Isabella, Ne plus Ultra, Formosa, Pride of the Village, and L'Elegante. Grapes: 1st, Mr. Smith, gr. to W. L. Paterson, Esq., for Black Hamburgh and White Frontignan; 2d, Mr. Baxter, gr. to Sir W. Gibson-Craig, for Muscat of Alexandria, and Black Hamburgh. Gooseberries: 1st, Mr. Lauder, for Whitesmith and Hedgehog; 2d, Mr. Lyall, with the same varieties; 3d, Mr. Thomson, gr. to Miss Graham, for Green Hedgehog and Golden Lion. Peaches: 1st, Mr. Pender, gr. to D. Anderson, Esq., for Royal George; 2d, Mr. Mitchell, gr. to Lady Keith, for Noblesse. Nectarines: 1st, Mr. Pender, for Elruge. Pine-apples: 1st, Mr. M'Connochie, for an Antigua Queen, weighing 5 lbs. 4 oz. Melons: 1st, Mr. Mitchell, for Seabright Netted; 2d, Mr. M'Connochie, for Beechwood. Cauliflowers: 1st, Mr. Mitchell, for Walcheren; 2d, Mr. Anderson, for Oxenford Castle. Peas: 1st, Mr. Addison, gr., Gosford, for Hairs' Dwarf Mammoth; 2d, Mr. Thomson, gr. to R. Sym Wilson, Esq., for the same variety. Six Culinary Vegetables: 1st, Mr. Pender, for Glen's Early Cabbage, French Beans, Carrots, Robertson's Yellow Turnip, Long Pod Beans, and Globe Artichokes. Silver Medal to C. K. Sivewright, Esq., for the newest and most improved Garden Implement, his implement being intended to facilitate various garden operations, such as hoeing, grubbing, &c. The prize of one guinea, offered by Messrs. Dicksons and Co. (through the Society), for the best four Cape Heaths, was awarded to Mr. Read, gr. to J. Syme, Esq., for small but well-grown plants of jasminifera, eximia, tricolor Wilsonii, and a variety of Irbyana, designated pulcherrima. Thanks and honorary awards were voted to Messrs. Dicksons and Co., for a collection of Exotic Plants, embracing Heaths, Lobelias, Achimenes, Seedling Calceolarias, a new species of Angelonia, and other plants of interest, besides cut blooms of Pelargoniums; to Messrs. J. Dickson and Sons, for a large number of Greenhouse and Stove Plants, including Lilies, Achimenes, and Fuchsias; to Messrs. Lawson and Son, who also sent a large collection of Exotics, embracing flowering specimens of Hæmanthus pubescens, H. coccineus, and Achimenes Jaureguia; also dwarf flowering plants of Rhodanthe Manglesii, trays of cut Roses, several interesting and rare Vegetables, such as the Long Bontsfield Turnip, White Sugar Beet, &c., and a collection of new Conifers, including Thuja chilensis, Juniperus funebris, Retinospora ericoides, and Biota glauca; to Mr. Stark, for collections of Greenhouse Plants, Alpines, trays of Rose blooms, Antirrhinums, a curious Statice from St. Petersburgh, and a flowering plant of Echnidia Bartonoides; to Mr. Carstairs, for Fuchsias, Balsams, and Geraniums; to Messrs. Downie and Laird, for a stand of Verbenas, with Fuchsias, among which Falstaff was particularly noticed, and several trays of Hollyhock blooms; to Mr. Methven, for a selection of Greenhouse Plants, embracing Heaths, Fuchsias, and Calceolarias, Adamia versicolor, and Selago fascicularis; to Messrs. Ballantyne and Son, for trays of Roses, and Hollyhocks; to Mr. Handasyde, for Roses, Carnations, and Verbenas; to Prof. Syme for Kalosanthes miniata nitida, upwards of 15 feet in circumference, and bearing 317 heads of flowers; to Dr. Neill, for Alpines and other plants, including Erpetion reniformis, Gesnera libanensis, &c.; to Prof. Dunbar, for Achimenes Jaureguia, Calystegia pubescens, and elegant Heaths and Fuchsias; to I. Anderson, Esq., for several exceedingly interesting plants, including Callitris splendens, and also a very curious hybrid Geranium, with the leaves quite white on one side of the plant, and green or variegated on the other; to Mr. Veitch, for Ferns and Mosses, the latter comprehending upwards of 50 species in excellent health; to Lady Grant, for a flowering specimen of Brunsvigia Josephinæ, and a basket of Myatt's Seedling Strawberry; to Mr. Nicoll, for greenhouse plants, a plant of Bishop's Dwarf Cluster Bean, showing it to be an excellent bearer; also blooms of Antirrhinums and Marigolds; to Mr. Mackie, for flowers of Orange, African, and French Marigolds; to W. Gilmore, Esq., for a basket of Kidney Potatoes and four specimens of Vegetable Marrow, with a fine display of Ten-week Stocks; to Mr. Burns, for Statice mucronata, a basket of cut flowers, and one of well grown vegetables, including Robertson's Golden Stone Turnip; to J. Renton, Esq., for a dish of Strawberries and two large Snake Cucumbers; to D. Anderson, Esq., for Peaches, Nectarines, Apricots, and Strawberries; to Mr. Adamson, for Mayduke Cherries, Fastolff Raspberries, and Elton Pine Strawberries; and to Mr. Addison, Gosford, for large Balsams, 13 varieties of Gooseberries, and a selection of the varieties of early and late Potatoes chiefly cultivated at Gosford. Thanks were likewise voted to Mrs. Greig, for a glass case of native Ferns; to Mrs. P. R. Ramsay, for flowers of a yellow Picotee; to J. Mood, Esq., for two boxes of Dahlias and Marigolds; to Mr. Lightbody, for a box of Picotees and Carnations; to Mr. Mackenzie, for Hollyhocks, dwarf Cockscombs, and a tall device of flowers; to J. Roughead, Esq., for a stand of cut flowers, and blooms of Dianthus; to Mr. Goodhall, for an elegant display of Larkspurs and Ten-week Stocks; to Mr. M'Connochie, for three well-grown Pine-apples, Moscow Queen, Ripley Queen, and Antigua, and two Persian Melons; to Mr. Anderson, for three dishes of well-kept Apples; to Mr. Lyall, for a dish of Citron de Carmes, and green Sugar Pears; to J. Russell, Esq., for Hollyhocks; to Mr. Lauder, for Gooseberries, and a dish of red Currants; to C. K. Sivewright, Esq., for Carnations and Picotees; to Mr. Veitch, for Hollyhocks; to Mr. Scott, for seedling Hollyhocks; to Mr. C. King, for double Carnation Poppies; to Mr. Young, for Carnations and Picotees; to Mr. Thom, for seedling Strawberries; and to Mr. Pringle, for seedling Gooseberries.

Meetings at Worton Cottage.—We wish to call particular attention to the Hollyhock, some exhibitions of which will be noticed hereafter. This flower has reached a point of beauty not sufficiently known in the country at large, and it is quite time the poor things we have observed in very large establishments were replaced by such flowers as have been exhibited by the Messrs. Chater. With this observation we will proceed to a detail of what have been submitted for exhibition. A variegated Geranium was produced by Mr. Layton, of Hammersmith, of good habit and with horseshoe foliage; the flowers scarlet, and a good trusser. Calceolaria: "T. W. N." Ground colour yellow, with crimson stripes and blotches; throat too large. Phlox: "A. O. H." Too near Drummondii oculata, with which it was compared. Carnation: "J. Scholefield and Son." Your seedling S. B. has all the excellent qualities observed in it at the Derby meeting; the petal is of fair shape and texture, smooth, white pure, scarlet bright, and well distributed. Knowsthorpe Pet will no doubt be worthy of its name. Picotee: Same growers. Bright purple of medium width; white very pure; will prove an acquisition in its class. Hollyhocks: Messrs. Chater and Son, of Haverhill, Suffolk, exhibited a very beautiful spike, shortened to 20 inches long, of a seedling named Queen of England, with 15 flowers upon it, each 5 inches in diameter, of a bright delicate pink colour; the guard leaf good, centre full and compact. Mr. Chater, of Saffron Walden, produced a collection of cut blooms well worthy of his reputation; amongst them many seedlings, included in his catalogue of this year for the first time, viz., Improved Purpurea Elegans, dark purple; Snowball Superb, delicate white; Seedling Rose, a bold flower; Walden Gem, deep ruby crimson, improvement in colour on Comet; Chater's Rosy Queen, beautiful deep blush; Spectabilis, deep rose, shaded with salmon; Orion, a very good shaped flower, light crimson; Improved Rosea Alba, a parti-coloured flower, valuable for a collection; and Venosa Improved, dark marbled colour. Accompanying them were a number of older varieties, including Black Prince, Pulchella, Sulphurea, Perfecta, Model of Perfection, Rosea Grandiflora, Magnum Bonum, Coccinea, Beauty Supreme, Queen (Barron's), Attractive, and Fireball—all worthy of a place in every garden. "W. J. E. Maidstone" sent spikes of two seedlings, small, but nicely formed: 1, a novel dark purple flower, with light edge, good centre and guard leaf; 2, with the flowers thickly set on the stem, colour a deep pink, with light edge, bold centre, the guard leaf wanting the smoothness of No. 1. "Kelso:" Mrs. Tait is very similar to Chater's Queen of England, noticed above, but it is not so full a flower; its colour is a rather more delicate pink. Raisers of the Hollyhock must try to obtain more substance and smoothness in the guard leaf; that obtained, will leave little to desire except variety of colour, and to that there seems no limit. Fuchsias: "R. G." Two single flowers of two light

varieties, one of them globose in character, but neither of them any improvement upon varieties in cultivation, if we except the corolla of No. 1, which is very well formed.

Review.

Griffith's Posthumous Papers. Arranged by J. M'Clelland. Calcutta. 1848.

When Mr. Griffith died he left his voluminous papers and large collections of all sorts to the East India Company, by whom the former were ordered to be printed, and the latter to be distributed. This was an act worthy of the most munificent government in the world, and increased the large debt already due to it by all students of natural history. It was also a graceful tribute to the memory of one of the most zealous and distinguished of the many who have perished in the company's service. His writings, of which so few have been previously published, furnish the best biography of Griffith's short but brilliant career—to those who can understand them.

We have now before us three octavo volumes of journals and botanical notes, with two quarto volumes of plates; and it is understood that more remain to be published. The latter and a considerable part of the former consist of hasty sketches and notices, more or less complete, of plants that came under the author's observation while in India. They constitute a mass of technical English mixed with scraps of Latin, or of technical Latin mixed with scraps of English; and although very far from being what Mr. Griffith could have intended to publish, are of high value on account of the original views and very careful investigation of minute matters which they comprehend. The importance of these documents is, however, much impaired by endless misprints, and by the imperfect manner in which the author's half legible notes have been transcribed. To foreigners, unacquainted with Indian proper names, and unable to distinguish between places and things, some of the notes will, we suspect, be wholly incomprehensible.

The journals and private letters which form the remainder of these volumes are of much general as well as scientific interest, containing as they do the daily notes made by so good an observer, during many years' travel in various parts of India, and his unreserved opinions concerning passing events, communicated confidentially to his friend Dr. Wight. We must, however, express our doubt of the propriety of making these opinions public. The letters were never intended for any other eye than that of the gentleman to whom they were addressed, and are full of hasty, ill-considered remarks, which the writer would have been the last man to put on record as his deliberate judgment. For instance, in one place, writing upon erroneous information, he says:

"It has been found that hybrids may be formed between Orchideæ of any of Lindley's sections! This is fatal to his Orchid classification! The seeds of these, though they appear perfectly formed, have not been made to germinate. Is not this startling? and to what new views of classification it may lead, who knows?"

So far is this from being the case, that we do not to this day know with certainty of a single mule Orchid; it is suspected, indeed, that some of our garden species have a hybrid origin, but no experimental proof of it has been obtained, or is likely to be. The paragraph just quoted is, in fact, self-contradictory, for it first asserts "that hybrids may be formed," and then that the seeds have not been made to germinate! so that the only evidence upon the subject is precisely that which is absent. No person's private letters ever required more severe pruning than those of Griffith; he was a man of a hot temper and impetuous feelings; and his opinions were hotly and impetuously expressed, whether in praise or in blame, without much consideration. His mind, moreover, was not so well trained as his eye; and consequently his reasoning was far inferior to his observation. He had an admirable skill in following minute facts through all the obscurities in which they are involved; and his correct knowledge of the theory of vegetation enabled him to observe correctly the phenomena that he witnessed. But when he proceeded to generalise, or to reason from the facts he noticed, then his value as a naturalist began to diminish. This was remarkably shown in his notions concerning the raments of Ferns, and sexes in the lower orders of plants.

In the 2d volume of these Posthumous Papers are found the private letters to which we have referred, and from them we select a few passages which are likely to interest the general reader. Writing from Cabul, Sept. 25, 1839, he says: [We correct the typographical errors.]

"Of this place itself I am quite tired, and shall be glad when the advance, which is expected to take place in a few days, actually appears in orders. The other side of the town did present some verdure, but this is as barren at present as any part of Arabia Felix: hills without a particle of vegetation, presenting one unvaried uninteresting brown hue. I have, in addition to the long march from Candahar, also made one of 24 days to Bamean and back, which place is on the other side of the Indian Caucasus, though still farther within the mountains, and is famous for its caves, gigantic idols, and ruins. And such scenery; how indescribable! A valley to some extent enclosed by most beautifully sculptured mountains, presenting every variety of colour—here rosy, red, yellow; there bluish, purple, brick-red, and presenting such infinite variety of outward form; here columnar, there having the appearance of richly fretted work; here a huge cliff, there a mountain thrown down, scattering its wreck in every direction. This trip gave me 200 species, mostly very alpine, thus swelling my list to 1200 species; alas! 1200 only, when I expected 2400 at least! But perhaps next spring will give me more additions. The curious vegetation still continues; and it is to all intents and purposes Mediterranean. One prevailing feature of the mountains, even as high as 13,000 feet, is the abundance of prickly Statices, forming a section to which the term Hystrix would be aptly applied. After crossing the highest ridge, Salsoloideæ become very common. We crossed five ridges of the following heights: 10,000, 11,320, 12,180, 12,480, 12,900. We had some severe cold; some snow and ice. Ice was found, or rather some half frozen snow, in ravines at 10,500 feet and upwards, and the effect it had on the vegetation was most marked. This was a fortunate circumstance, as it gave me specimens in flower, which elsewhere had long been out of flower, or even past seeding. Mosses still continue rare, and only one Orchidea and two Ferns have as yet been found in Affghanistan." This statement is, however, quite at variance with his botanical memoranda.

The account he gives of the Punjaub, in a letter dated Shikarpore, Feb. 1839, is not calculated to raise its vegetation in public estimation:

"At present I am in the worst country upon earth, that is, so far as botanical pabulum goes, for I never saw such abominable sandy wastes as those to which we have now become accustomed. India, on this side the Rajmahal Hills, is so bare of forest, that few places would afford a flora extending beyond a few hundred species, chiefly of such herbaceous forms as are connected with cultivation. Loodianah being in 31° north, has some European forms, a Linaria, Reseda, Medicago, Alisma, Sparganium, Typha foliis angustis, Farsetia Hamiltonii, Lithospermum, &c.; but as you correspond with Edgeworth, perhaps he has told you all. Scarcely a tree have I seen anywhere except a Mango, or Peepul, or such like. The country is generally covered, particularly along the Indus and its streams, with Tamarix, of which Tamarix Furas is a beautiful coniferous looking tree. What a name, Furas! when one so applicable as cupressoides might have been given. Around this plain, which is in 27° 55′, nothing is to be seen but Tamarix, Acacia modesta, and a still more interesting Acacia, Ziziphus, Calotropis Hamiltonii, &c., yet I have found some (to me) novelties which have afforded me some occupation lately. The best were a Phascum and a Poplar-like tree, which I suppose is Liquidambar, although, as usual, it disowns its character."

The scenery of Bootan is of a very different character.

"Since reaching the plains, I may say I have done nothing, as the vegetation is precisely the same as that of Lower Assam. Neither did I get many plants during the four last marches in the hills, for although the elevation of some ridges still amounted to 5000 feet, yet the vegetation is almost quite tropical. I regretted leaving the higher ranges, the climate being so exquisite, and the spring vegetation so beautiful. At Chupcha I availed myself of a halt to ascend 10,000 feet, and was well rewarded for my pains. But I saw enough to make me wish to remain there during the rains, at which period the flora of such places can only be said to exist. Anemones, Bistortæ, Morina, Iris, Betula, Saxifraga, Primula exquisitissima, Trillium, Abelia? Cerasus, Salix, Abies, Pinus, Papaveraceæ, Aconitum, Rhododendrons, Aquilegia, &c., were all observed in some stage or other. Of the Rhododendrons, I cannot speak in terms of sufficient ecstacy. I have upwards of 15 species, which number might perhaps be doubled by a longer residence. My collection will amount to between 1400 and 1500 species, including Mosses and Hepaticæ. Congratulate me on having found Lyellia, regarding which I was led to suppose that it was a native of high altitudes, whereas I find it no higher than 400 feet. I have only brought away about 3 lbs. of specimens. Bootan, from altitudes of 6000 to 10,000 feet, is a lovely country; defined open woods, interrupted by large patches of sward, with here and there marshy spots, give one a vast selection of spots to hunt over for plants. Of all woods, give me one with a plentiful sprinkling of Rhododendrons. With Gooseberries and Currants I have been quite familiar, and at lower altitudes than I expected. The chief vegetation of the higher spots, at least I mean temporary vegetation, consists of Monocotyledons, especially Liliaceæ. How shall I describe the Aroideæ, especially the Pythoneæ, of which I have seven species. The most curious plants I have lately found is a Peloriod Swertia, which Royle I think mentions, and a curious creeping Ranunculus-leaved monopetalous plant, probably a Sphaceleoidea." [What is that?]

Garden Memoranda.

Royal Botanic Garden, Glasnevin.—There is now in flower here, for the first time in Europe, the rare and beautiful Wallich Lily (L. Wallichianum) received by Mr. Moore from Major Madden, an invaluable Indian correspondent of the Garden. It is in the way of longiflorum and eximium, but has very narrow leaves.

Pymmes House, Edmonton.—Among the many relics of bye-gone days to be found in the neighbourhood of this familiar suburban village, few afford more interest than Pymmes House, an old-fashioned edifice, built somewhere about the time of Charles I., but suitably modernised in appearance by the present proprietor. Its bright-red coloured front, divested of all Roses and climbers, which might harbour damp, and whose fastenings might tend to deface it, is seen conspicuously through the trees from the public bye-way which passes near it. The grounds have been greatly improved within these five years, and a new coach-road to the house is at present in course of formation. The flower-garden contains a nice piece of ornamental water, adorned with patches of Water-Lilies, and surrounded by a closely shaven lawn, containing flower-beds, except on one side, where the object aimed at has been the hiding of the kitchen-garden, which lies beyond it. This has been effected by a thick hedge of Arbor-vitæ trees on the top of the slope; a little further down the bank a row of standard Roses; then a row of Dahlias and Hollyhocks mixed; and in front scarlet Geraniums and Verbenas, the latter scrambling among burrs down to the water's ege. Viewed from the walk on the opposite side, this arrangement has a strikingly good effect. Passing the lake and a graceful Napoleon Willow at its extremity, we reached a beautiful piece of lawn immediately in front of the house, furnished with four marble statues, a fine Cedar of Lebanon, a mossy cupped Oak, and other forest trees, and ornamented by two long parallel strips of geometrical flower-beds, the first series being divided from the broad gravel walk in front of the house by a Grass border about 8 feet wide, and the second series from the first by another strip of Grass some 40 feet in width. Here and there along the latter, intermixed with China seats, were boxfuls of Ivy-leaved Geraniums, whose appearance was very effective. In the beds, which are now nearly at their best, and very gay, we remarked Calceolarias Kentish Hero and Amplexicaulis. Geraniums: Rollisson's Unique, Mangles' variegated and another variegated kind, Luceum Roseum and a somewhat darker coloured variety, Fair Helen, the Improved Frogmore, Compactum, Tom Thumb, and other scarlets. Verbenas: La Ardoise, purplish blue; Heloise, ditto; Princess Alice, blush, with a rosy eye; Madame Rattier, blush, with a rosy pink centre; Crimson King; Perfection, white; Duchesse de Cazes, bluish purple, with a black eye; Array, crimson. Cupheas of different kinds, beds of Agathea cœlestis, and Ageratum cœlestinum; the blue Campanula carpatica, which had also a very pretty appearance in rows along the sides of the walks; Pentstemon gentianoides splendens, Petunia Shrubland Rose, and other varieties. Round the base of one of the statues we observed Plumbago Larpentæ, but it has never flowered, possibly owing to its being in too luxuriant a condition; a dry poor soil would seem to suit it best. Passing the lawn, the walk leads through a herbaceous garden, by the side of a brook full of the white Water Lily, which seems to luxuriate in its nearly still waters; and farther on, in the same brook, there is a waterfall, but it was not in action when we saw it. But to return to the flower garden: a portion of the old kitchen garden wall connects the Arbor-vitæ hedge above alluded to with the house, and in order to render this ornamental, it has been covered with Magnolias, Bignonia radicans, Jasmines, Wistaria sinensis, climbing Roses, &c., and at the end, next the hedge just mentioned, with a Fig tree, which, in the course of the season, produces bushels of Figs, the young fruit being always preserved from the winter's frost and wet by a waterproof covering. A lean-to greenhouse occupies a portion of this wall, opposite the head of the lake. It was gay with Clerodendrons, Balsams, Achimenes, Pentas carnea, Fuchsias, the charming Dipladenia crassinoda, a Hoya carnosa, with nearly 100 trusses of bloom on it, and in the darker parts of the house with Campanula pyramidalis, a very suitable plant for such situations. The small border at the base of the wall was composed of little circles, each containing a Fuchsia in the middle of dwarf-growing bedding plants. These circles were divided from each other by narrow walks edged with Box, and surfaced with light-coloured pounded China, which gave a lightsome appearance to a situation otherwise somewhat dark and gloomy. In the kitchen garden is a long span-roofed forcing-house, in three divisions, with pits in front for growing Melons in, &c. There are also a Vinery and a greenhouse, the latter containing Azaleas and Camellias, some pits, and a small propagating house. Cucumbers have been cut in the forcing-house from last October until now, and in the pits in front Beechwood Melons will soon be ripe, being a second crop from the same plants this year. Ridge Cucumbers have been all killed by mildew, which has been very troublesome here this season. For killing mildew on plants in houses, it has been found that sulphur-water (water after the sulphur has fallen to the bottom) is equally efficacious with dusting the plants with the sulphur itself, and it is a much more cleanly method, as the plants require no washing afterwards. In conclusion, it is but right to mention that everything exhibited the very best management, and reflected much credit on Mr. Speed, who is gardener at the Pymmes.

Miscellaneous.

Febrifugal Properties of Alkekengi (Nicandra physaloides).—The new observations contained in a communication from M. Gendron tend to confirm those made previously by the same gentleman on the advantages to be derived from the use of the capsules of Alkekengi in intermittent fevers. The author however

has ascertained that this plant cannot, as he had hoped it could, replace all the other more costly febrifuges. After a long series of experiments he has ascertained in what circumstances and quantities it can be used with success, and has discovered that the quantities before recommended by him were too small, and thus occasioned the failures which have been complained of by those who followed his directions. M. Gendron has studied the action of the different parts of the plant. The febrifugal qualities belong more particularly to the capsules and the berries; they are more marked if the fruit is allowed to ripen and even begin to dry upon the plant; the gathering should be made in October, when the medicine seems to act with most energy. Berries dried by a stove, powdered, and kept from air and light, retain their properties from one year to the other. The powder of the isolated capsules is very bitter; that of the berries is, in addition, acid. M. Gendron has given, without inconvenience, 30 grammes of this powder per day in two doses; an ordinary dose is from 10 to 12 grammes. *Comptes Rendus.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

THAT the plants which are intended for various purposes, and different seasons, may each receive such sort of treatment as is most calculated to make them answer the end for which they are grown, a distinction should be made between those which are designed to keep up the display between this time and the end of November, and those which are to be useful during midwinter and early spring. A third class will consist of those plants, principally hard-wooded, which are cultivated more especially for their summer services. By reducing the thing to a system, in assembling together those whose season of flowering and required treatment are similar, it is more easy to give to each the particular treatment which its case demands. We are aware that to do this properly, several houses or pits are required; but where such conveniences are not at command, much may be done even in one house, by arranging the plants for the different periods, in such situations as may, on consideration of the matter, seem best calculated to ensure them the treatment they require. The peculiar requirements of individual species render very careful observation and reflection necessary. For instance, many plants do better at a distance from the glass, while the very existence of others depends upon their being freely and fully exposed to the light. After this time the creepers on the roofs of plant-houses should be kept within more moderate limits, and gradually reduced as the season advances, that the plants beneath them may not be deprived of the sun and air so necessary to mature their growth. Many plants in these houses are now in the last stage of flowering; and if attention has been paid to raising a stock of young plants, the old ones of many quick-growing soft-wooded species may be discarded. By this practice, the remaining plants may be placed further apart, thereby allowing a freer circulation of air amongst them. Plants of Gloxinias, Achimenes, &c., which are from time to time removed from the houses to ripen their growth, should be placed in a dry frame, where they can have plenty of light, but where their supply of water must be gradually reduced; they must not be allowed to get dry all at once, which is too commonly the treatment they receive, and in consequence of which many of them perish entirely.

FORCING DEPARTMENT.

MELONS.—These are now growing fast, and must have regular attention in regard to stopping and thinning. Let the plants have abundance of air, and retain a little all night, as the flavour of the fruit is much improved by a systematic attention to this point. Let them have an ample supply of water, except when the fruit is ripening. Continual care is necessary at this season, to prevent the establishment of the red spider on the leaves; and another enemy, not less to be guarded against is the cricket, which eats its way into the fruit both of Pines and Melons, just as they are approaching to maturity. The best way of destroying them is to mix some arsenic and crowfig (nux vomica), and lay a little in the bottom of an earthen pan, placing a pan of water near it. The crickets eat the poison greedily, until they are driven by thirst to the water, of which they drink till they burst.

FLOWER GARDEN AND SHRUBBERIES.

Cold frames, handlights, and every other convenience for propagating, will now be put into requisition. Calceolarias, Pentstemons, the best kinds of Lobelias, Senecio, Petunias, &c., when sufficiently struck and gradually hardened, may be taken up and potted. This mode of striking is very much less troublesome than in heated structures; while, at this season, it is equally certain. Prepare for getting the best Cinerarias potted. Let the Carnations and Picotees in pots, for winter flowering, have every attention, that when placed on the front shelves of the greenhouse stage in November, their flowering shoots may be strong and numerous. If they have been prevented flowering, and no shoots are now upon them of more than 4 or 5 inches in length, they may be allowed to grow from this time, as they will begin flowering in November, and if the plants are healthy, they will continue through the winter.

FLORISTS' FLOWERS.

PANSIES.—Plant out young plants for blooming next spring, and at the same time pot several of each sort for filling up vacancies, should any occur, from frost or accident. Several new ones are worth inquiring for, though these are less candidates for public favour; Mr. Beck is one of the most promising. RANUNCULUSES.—It will be advisable to make the bed for the next year's use. A good rich compost is most desirable, that of a cool nature is best; the bed should not be made higher than the paths. If well made, and turned several times during winter to sweeten, little more need be done till nearly planting time. As for Carnations and Picotees, the directions given last week may be attended to. AURICULAS and POLYANTHUSES.—The latter, at this season, will often have the neck of the plant bare; to counteract any ill effect, it will be requisite to move the soil about them, and draw it round the plants. Seedlings will also sometimes be thrown or drawn out by the large earth-worm; they should often be examined and carefully replanted, as the weakest plants often produce flowers with the best properties. DAHLIAS.—These must have the blooms shaded, if intended for exhibition, and fastened in such a manner that they cannot chafe or be injured by high winds. Pinks need but little attention, except watering them occasionally; when the soil has not been well attended to, wire-worms will attack them; as soon as their ravages are perceived, they must be caught, whatever may be the trouble.

KITCHEN GARDEN.

Continue at intervals to earth up some of the earliest Celery a few weeks before it is required for use; but, unless in very cold and late localities, it is better to defer the soiling of the general winter crop till the third or last week of September. Let the intermediate rows of Peas, &c., be cleared away as soon as possible after their produce is gathered, that the Celery may have the advantage of the additional light and air. As an extra stimulant for any crops which we wish to grow particularly fine, we have all the dung from the aviaries and poultry-yard carefully collected, and mixed with three or four times its bulk of charred refuse. The heaps of this mixture are cased over with charcoal-dust, and after lying a year in that state, we use it for almost all kitchen garden crops; considerable care, however, is necessary in this, as it is nearly as strong as guano, and of course an over dose would be dangerous. After the ground is regularly dunged and trenched, a light top-dressing of this mixture is forked or raked in, previous to planting or sowing the crops; and to others in a state of progress, we lay a ring of it a few inches distant round the collar of the plant, and cover it with a slight top-dressing of soil; the riches of the manure being diffused through the soil by the rain.

HARDY FRUIT GARDEN.

WALL TREES.—The tying in or nailing of these should now be gone over for the last time this season, that the young wood, from its closer proximity to the wall, may have a better chance of ripening. Now that the fruit of Morello Cherries is gathered, as many of their shoots as space will admit of without being crowded, should be laid in. Enough has been said about Strawberries in former Calendars, and all that is now necessary is to urge the early completion of the work connected with the summer management of this crop, especially in making new plantations, and cutting away the runners, and forking rotten dung about the roots of the older ones. The old Raspberry canes which have done bearing should now be cut away, and the strongest of the young canes tied loosely up in their places, stopping the very luxuriant ones at about 5½ feet high. A little rotten dung forked in amongst them will very much assist the swelling and ripening of the buds for next year's crop.

State of the Weather near London, for the week ending Aug. 22, 1850, as observed at the Horticultural Garden, Chiswick.

The highest temperature during the above period occurred on the 25th, 1826—therm. 83 deg.; and the lowest on the 30th 1838—therm. 38 deg.

Notices to Correspondents.

APRICOTS: *Sumertonensis.* The seedling is round, like the Peach Apricot, but woolly and insipid like the Orange. It is, therefore, new, but of no value, and we should not continue to grow it. Bud it with the Peach Apricot, quite as late, and really excellent.—*J G.* We are glad to see that your Apricots at Hexham are so fine, and to hear that the crop is so large. Hereabouts the frosts of May 3 destroyed most of this kind of fruit. Many thanks.

BOOKS: *A B.* Apply at 21, Regent-street.‡

DAHLIAS: *H B.* Whatever ails your Dahlias, of this you may be sure, that they are not struck by the Potato blight. We can offer no suggestion.—*G A.* The Horticultural Society neither has nor has had any such intention.

FUCHSIAS: *Kelvedon.* A very curious "sport," certainly. Two different kinds of flowers on the same plant is a novelty. Just try and propagate separately the two branches which bear the different flowers, and let us hear further. It is probable that in this way you will fix the variety. These "sports" are highly curious. The other day we saw, in the possession of the Earl of Jersey, a Dahlia which bore on the same stalk a deep purple self flower, and a white one streaked very slightly with purple.

HOLLIES: *A M.* They may be removed with safety in September.‡

HYDRANGEAS: Will the *Gardeners' Chronicle* inform *Romsey Abbey* why a bed of Hydrangeas planted in rich garden loam three years ago, and regularly watered, has constantly an unhealthy appearance, the leaves turning yellow, and a large proportion of the plants not flowering, but remaining dwarf? We refer this to the kind attention of correspondents who have seen the affection of which *Romsey Abbey* complains. In heavy land, where the roots make way with difficulty, we know that Hydrangeas are unwilling to flower, and grow in a stunted manner, manure them as you will.

HYDROSTATIC SYPHON: In reply to several inquiries we have to state that we are acquainted with this instrument only through our correspondents, who however speak well of it. The best plan is to enquire of Mr. Bird, the patentee.

INSECTS: *C H.* The caterpillars from Hyde-park are a brood of the buff-tip moth (Pygæra bucephala). They turn to chrysalids, inclosed in a silken case, and have no poisonous property. *W.—Bedhampton.* The caterpillar of the eyed hawk-moth (Smerinthus ocellatus). *W.—Sub.* Your leaves were badly attacked by the common thrips of the hothouse. Syringing with tobacco-water, and fumigation (the house being made as air-tight as possible), are the only remedies. The Camellia leaves were also attacked by the flat scale. Syringing with hot water will destroy these. *W.—Este.* The eggs are evidently those of the common Gooseberry saw-fly. *W.—J L S, Bedale.* We do not know by what insect the eggs on the Birch twig were deposited. *W.—C R.* We are glad to learn that the rains have dispersed the plant lice from the Oats. The caterpillar sent is that of the peppered moth (Biston betularius). *W.*

MILDEW ON GRAPES: *Young Gardener.* Mr. Baker has found (see p. 533) that the steam from hot dung will kill it. Before doing anything else, you had therefore, perhaps, better try the experiment, and report to us the result.‡

NAMES OF PLANTS: *J S.* We have no idea what it is.—*Cymro* 1, Polypodium vulgare; 2, Asplenium trichomanes; 3, Cystopteris fragilis; 4, Asplenium viride. *S.—C J W K.* Sallsburia adiantifolia; a hardy deciduous tree.—*Usk.* Saponaria officinalis.—*Erzeroum.* 31, Arnebia echioides.—*J Y, Clonmel.* Cassia lævigata.—*Dundee.* Some Phytolacca, and apparently the common Pocan or Poke, Ph. decandra.—*H R J.* A. Dianthus plumarius; B. Echinops sphærocephalus; C, Coronilla varia. Strike your cuttings now, if you can keep the plants over the winter. If not, wait till spring.—*J M R.* Scolymus hispanicus.—*J B.* 4, Hydrocotyle vulgaris; 2, Ajuga reptans; 1, Polygonum amphibium; 3, Peplis Portula.—*B T.* 1, Woodsia ilvensis, rare; 2, 4, and 9, Asplenium Filix-fœmina; 3, Lastrea Thelypteris; 5, L. oreopteris; 6, L. Filix-mas; 7 and 8, L. dilatata; 10, Polystichum lobatum; 11, Phymatodes Billardieri. *S.*

ORTHOGRAPHY: *A Prentice Laddie.* The author of such a list is a blind man undertaking to lead those who possess their eyesight. The spelling is infamous.

PITS: *G G.* You should have a pipe above your beds and a couple below, with the power of stopping the circulation in the upper pipe. The lower pipes must be in a chamber, which may be constructed with rough slabs. Do not use tanks for your bottom-heat; they give off too much moisture and rot the roots.

PRESERVING FRUITS. We have tried the quality of some jars of fruit, &c., preserved by the method of Mr. James Cooper, of Brixton-hill (see Advertisement, May 25). Upon opening the jars some were found of inferior quality, others very good, and one of them, of Mulberry, most excellent. Mr. Cooper's method evidently deserves to have a fair trial. Nothing could be better than his Greengages, and Raspberries and Currants.

RHODODENDRONS: *G F L.* Yellow or buff-coloured varieties are not uncommon. They may be obtained of any of the large Rhododendron growers.‡

RHUBARB: *H S and Co.* It is not easy to form an opinion about Rhubarb, when cut; and it is quite impossible to tell whether it is *early*, if sent for examination in the month of August!

ROSES: *Rosa.* The market gardeners propagate the Moss and Cabbage Roses by layers; by pruning the shoots back to two or three eyes early in spring, they are kept low and full of wood. Under careful culture the bushes may be kept handsome for several years. They should have a good dressing of well decomposed stable manure every winter. The following are 12 fragrant Hardy Autumnal Roses. Damask Perpetual: Duchess de Rohan, Julie de Krudner, Laurence de Montmorency. Hybrid Perpetual: Aubernon, Clementine Seringe, Cornet, Duchesse de Galliera, Dr. Marx, Marquisa Boccella, Polybe, Réine des Fleurs, Sydonie. Duchess of Mecklenburgh is only a second rate Rose.‡

STRAWBERRIES: *Amateur.* See our article on "Villa and Suburban Gardening" in another column.‡

VINES: *W F D.* If your Vines that are making their first year's growth, are growing vigorously and have plenty of room, do not yet stop their leaders.‖—*D W.* On your dry sandy bottom, your Vines have doubtless suffered from drought during the growing season, for then the Vine requires more water than is afforded it in very many cases. Your border ought to be made at least 2 feet deep, and on your subsoil it will be well to concrete it. You must cut back, to get strong wood. By making a rich border, with plenty of heat, plenty of air, and sufficient moisture you cannot fail to get strong wood; and as you say you succeeded best with the long rod system, keep by it.‖

WALL FRUIT: *Sub.* It may be preserved from wasps, &c., by wrapping it in tow; or, if you do not mind expence, you might try Halliman's fruit protector.‡

WEEDS: *A H R.* Lime will not destroy them; it is quite as likely to promote their growth. It is a great misfortune to succeed a sloven, but there is no remedy except patient weeding as fast as weeds make their appearance. In a year or two you may expect to be cleaned, provided you keep the ground well stirred during the first summer.

MISC: *Lady M.* Your Fuchsias are possibly too luxuriant to flower well; try the effect of partially starving one of them for want of water for a while. The main point to be attended to in the management of Pardanthus chinensis is to give it a long, warm, dry rest in autumn. Calistegia is readily increased by its roots. Your Alstrœmerias, whose "tubers are sound," will come up hereafter. Œnothera should be pronounced Enotheera.‡

SEEDLING FLOWERS.

ESCHOLTZIAS: *S W.* Semi-double Escholtzias are not uncommon, but they will not remain semi-double.*

FUCHSIAS: *S F and Co.* Considerably shrivelled when received; but apparently worthless as a "show flower."*—*T T, Chelmsford.* 2 is the best. It has a finely coloured corolla, and the sepals reflex well; but the latter, together with the tube, should be white, to contrast well with the corolla.*

HOLLYHOCK: *C and Son, Haverhill.* See our report of Worton Cottage Meeting in another column.*

PINKS: *Maria.* They are Pinks of little or no merit.*

VERBENAS: *T T, Chelmsford.* M. 2, scarlet, light eye; Fanny, nice light kind; and Forget-me-Not, purple; are distinct and worth growing. The rest are inferior to others of the same colours now in cultivation.*

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

Corn and Grass Manure, per ton	£10	0	0
Clover Manure, do.	11	0	0
Turnip Manure, do.	7	0	0
Superphosphate of Lime	7	0	0
Sulphuric Acid and Coprolites	5	0	0

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 15*s.* per ton; and for 5 tons or more, 9*l.* 10*s.* per ton, in dock. Sulphate of Ammonia, &c.

PERUVIAN GUANO.—As Agents of the Peruvian Government for the importation and sale of this valuable MANURE, we think it right, for the protection of consumers and respectable dealers, to apprise them that the adulteration of the article is still extensively practised, and to recommend them to apply either to ourselves, to our agents, Messrs. GIBBS, BRIGHT, and Co., of Liverpool and Bristol, or to dealers of established character, in whose honesty and fair dealing they can place implicit confidence. ANTONY GIBBS and SONS.

CORN MANURE FOR WHEAT, BARLEY, OATS, BEANS, &c. &c.

THE LONDON MANURE COMPANY most confidently recommend the above, as they are daily receiving very satisfactory accounts from parties who used it with great success last season. It will be found fully equal to and much cheaper than Peruvian Guano, and is not so liable to produce so large a growth of straw. Price Seven Guineas per ton, 3 cwt. per acre. They also beg to offer their Concentrated Urate, Superphosphate Lime, Nitrate of Soda, Sulphate and Phosphate of Ammonia, Fishery and other Salt, Gypsum Sulphuric Acid, and genuine Peruvian Guano. To insure this free from adulteration, all purchasers can receive it direct from the Warehouses of the Importer.

Bridge-street, Blackfriars. EDWARD PURSER, Secretary.
Country Dealers and Agents supplied.

PURE WATER raised to any height from a small stream, where a fall can be obtained, by FREEMAN ROE and HANSON'S IMPROVED RAM; less waste, by two-thirds, than those ordinarily in use. Portable Steam Engines for Agricultural purposes, Threshing Machines, Deep-well Pumps, Water-wheels, Baths, Hot-water Apparatus, and Fountains. Towns supplied with Gas or Water. Drawings and Estimates made.—FREEMAN ROE and HANSON, Hydraulic and Gas Engineers; Office, 70, Strand, London.

DR. S. NEWINGTON'S AGRICULTURAL INVENTIONS.—An Illustrated Catalogue, together with a Lecture on the Seeding of Grain, and the after cultivation of the crops, sent gratis, on application to Messrs. DUFAUR and Co., 21, Red-lion-square, London.

THE CONICAL BOILERS INVENTED BY JOHN ROGERS, Esq., are supplied and fixed by JOHN SHEWEN, ironmonger, Sevenoaks. Also all kinds of Hot Water Apparatus. For Churches and Public Buildings, Mr. SHEWEN should be consulted, his Warm Air Apparatus being safer, more efficient, and more durable than any other.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

E. DENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses, when completed charged, from 1*s.* 3*d.* to 1*s.* 6*d.* per superficial foot, according to size and quantity; on one principle the roof is formed without wood or putty, and on another principle with wood rafters, and the glass put in with putty. Patent Sashes, requiring no paint, from 7*d.* to 9*d.* per foot. HEATING BY HOT WATER.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not been them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

MESSRS. NESBIT'S CHEMICAL AND AGRICULTURAL SCHOOL, 38, Kennington-lane, London.—A sound practical knowledge of Analytical and Agricultural Chemistry, Geology, Surveying, Levelling, Railway Engineering, &c., may be obtained in Messrs. NESBIT'S Academy, in addition to a good modern education.

Mr. NESBIT'S works on Arithmetic, Mensuration, Gauging, Land Surveying, English Parsing, &c., are published by LONGMAN and Co., and may be had of all Booksellers.

FOR WATERING GARDENS, BREWERS' USE, &c.
FLEXIBLE INDIA-RUBBER HOSE PIPES.

JAMES LYNE HANCOCK, Sole Licensee and Manufacturer of the PATENT VULCANISED INDIA-RUBBER PIPES and TUBING.

These Pipes are well adapted for Watering Gardens, conveying Liquid Manure, racking Beer and Cider, Gas Fittings, Chemical and all purposes where a perfectly sound WATERPROOF and FLEXIBLE PIPE is required.

Hot Liquors or Acids do not injure them. No oil or dressing is required in using them. They do not leak from remaining out of use, are permanently Flexible in all Temperatures, and are therefore particularly suitable for Fire Engines; and, from their not leaking, are found exceedingly useful in conveying hot or cold water to baths in dwelling houses and such like purposes.

A LIGHT VULCANISED INDIA-RUBBER HOSE is now manufactured for conducting Water and Fluids, at the following prices per foot:

Size.	¼ in.	⅜ in.	½ in.	1 in.	1¼ in.	2 in.	2½ in.	3 in.
1 ply ...	0*s.* 5*d.*	0*s.* 6*d*	0*s.* 8*d.*	0*s* 10*d.*	1*s.* 0*d.*	1*s.* 2*d.*	1*s.* 4*d.*	1*s.* 6*d.*
2 ply ...	0 8	0 9	1 0	1 2	1 5	1 8	2 0	2 3
3 ply ...	0 11	1 0	1 3	1 6	1 10	2 2	2 9	3 3

N.B. Vulcanised India-Rubber Garden Hose fitted with roses, jets, and branches, complete, with union joints ready to attach to pumps or water cisterns.

All orders or letters addressed to J. L. HANCOCK, at the Manufactory (and Warehouse), Goswell-mews, Goswell-road, London, will meet with immediate attention.

DICKINSON'S NEW ITALIAN RYE-GRASS SEED is now ready for delivery, price 7*s.* per bushel. No. 7, Curzon-street, May Fair, London.

HOW TO KEEP A HORSE FOR LESS THAN ONE SHILLING PER DAY.

"Do you bruise the Oats you give your horses?" "No." "Then you lose one bushel out of every three, and your cattle do not half so well."

MARY WEDLAKE AND CO.'S OAT-BRUISING MILLS. Superior Chaff Engines, simple in construction, doing from 50 to 500 bushels daily, and more. Almost all brewers and coachmasters in London use these implements.

118, Fenchurch-street, London. A pamphlet on the above, by sending 12 postage stamps. Chaff-cutters, Linseed, Bean, and Malt Mills.

IMPORTANT NOTICE.—EMIGRANTS are informed MARY WEDLAKE and CO. have from time to time supplied the first settlers to Swan River, Port Natal, and all the Australian Colonies, with AGRICULTURAL IMPLEMENTS; they beg an inspection of their stock, at 118, Fenchurch-street, near the Blackwall Railway. N.B. Persons becoming purchasers may have the benefit of an introduction to parties known to the firm at either of the above-named places.

WANTED A FARM of from 100 to 200 acres of Arable and Pasture Land, in good condition, with comfortable house and buildings, pleasantly situated in the neighbourhood of a railway, and at least 50 miles north-west of London. Rent to meet the times. The Advertiser would not object to take the Live Stock and Implements at a valuation, if they are desirable; and, provided the same advantage could be insured him on leaving the farm, would have no objection to pay a small remuneration for recent improvements on the land.—Letters, prepaid, to be addressed, stating particulars, to B. B., Post-office, Little Sutton, near Chester.

The Agricultural Gazette.

SATURDAY, AUGUST 24, 1850.

MEETINGS FOR THE FOLLOWING WEEK.

THURSDAY, Aug. 29—Agricultural Imp. Society of Ireland.
THURSDAY, Sept. 5—Agricultural Imp. Society of Ireland.

THAT our correspondents should criticise our remarks is what we both expect and desire, because the discussions thus created are the most effectual methods that can be devised for the illustration of the facts passing under our notice.

One of our correspondents, however, overlooking our real object and intention, has so far mistaken our meaning as to consider the recent remarks we made on the class of men to whom the management of estates is confided in the light of a personal attack. "He has observed," he says, "with pain our repeated attacks on the mixture of the solicitors' with the land-agents' business," and assures us that he has never, during 14 years, but once involved his employers in law expenses. This liability to the encouragement of litigation being one of the objections we made against the employment of lawyers as land-agents, we readily exonerate our correspondent from all liability to such a charge; at the same time, however, assuring him that his case is an exception to a general rule.

"N. P." may prove his own fitness, but that does not prove the fitness of his class, and does not answer one of our objections to these lawyer-land-agents. What we wish to see is, that landowners would, in the first place, take more interest in their estates themselves, and commit the subordinate management of them to men of skill and ability; at the same time giving them such a remuneration for their labour that they are under no necessity to eke out a paltry salary, by combining the somewhat incongruous professions of lawyer and land-agent.

"N. P." has given us one reason why landowners should not systematically visit their estates, as we recommend, namely, that they are tormented by "the tenant's asking for grants to which he is not entitled, which he has not been enabled to obtain from the agent." Our friend describes this case so feelingly that it must surely be his own. That the tenant is not able to obtain a certain "grant" from the agent is no proof that he is not entitled to it; and such a scene of confusion as an owner ordering what his agent had refused can never occur on a well-managed estate.

OUR remarks on the failure of CLOVER have led to some observations from Mr. SUMMERS on the common practice of "doctoring" the seed, which is undoubtedly one reason for this failure. In this, as in other purchases, we cannot too strongly urge upon our readers the importance of buying of those "on whom they can depend, for it is impossible for the most practised eye to detect the fraud. Sulphur, indigo, logwood, copperas, and verdigris, are all used in this nefarious practice, to the certain destruction of the vegetative power of the Clover seed." That this is one reason of failure of Clover there can be no doubt, and as it has been ascertained that certain parasitical plants do great injury on the Continent, we directed attention to this fact also with the hope that our correspondents would be on the look-out for them, and report to us if they found any. With regard to manures, we have to report (as we mentioned in our previous remarks on this subject) that though their use of course improves the crop, when the Clover is already there, yet not one that we tried seems to exert the slightest influence in preventing the mysterious disappearance of the Clover plant in early spring. Mr. SUMMERS suggests that possibly another cause for the failure of Clover may be that our land is not sufficiently deeply cultivated. Without for a moment under-valuing the importance of deep ploughing, we may remark that in our own case no difference can be observed between land that has been subsoiled and that which has received only the ordinary ploughing, and that we can see no greater success attend the growth of Clover on the lightest Turnip land than on the strongest clay. Both seem equally liable to fail.

The only remedy to this state of things that has hitherto been devised, has been the growth of Beans or Peas instead of Clover. This is a well-established fact, but the reason why this answers is as yet a mystery, chemical analysis having shown that the Clover plant and the Bean abstract from the soil as nearly as possible the same substances. In fact, Chemistry has not yet been able to throw light on the subject; for Dr. Anderson, of Edinburgh, recently analysed two soils, one on which Clover had failed, the other on which it had not, without being able to detect any satisfactory difference between them. Such is a brief summary of all we at present know on this important subject: it affords a striking instance how far we are from being thoroughly acquainted with the "principles" of agriculture.

LIQUID MANURE TANKS.

HAVING, about three months ago, made one of these indispensable adjuncts to modern farming, from which I was long deterred, imagining bricks, mortar, cement, and archwork to be the inevitable but costly materials of a tank, and having found that a good and durable tank may be built at a comparatively moderate expense, I herewith detail the method and the cost of such a tank. The inside contents are 6 feet long, 6 feet wide, and 6 feet deep. The ground—a pure sand—was dug out 7 feet deep, 8 feet long, and 8 feet wide. The bottom was puddled with clay a foot thick. An Oak post, 5 inches square, was placed about a foot from each corner; three Larch rails were morticed on each side of the tank into the posts; and slabs of Oak, Beech, or whatever odd rough timber I could find about my saw-pit, were nailed to the rails from the outside of them. One old crooked piece of Oak was especially sawed up for this purpose. The slabs were nailed vertically, and so we were not particular as to their all being the height of the posts, that is, 5½ feet. This entire frame was made and then taken to pieces again before it was placed in the tank. When set up, clay was puddled behind it one foot thick. Oak curbs were laid round the sides at the top. Pieces of Beech, 6 to 9 inches in diameter, chopped a little, to fit better together, were laid over as a covering, after a pump had been put down. The cast-iron pump was passed through a bore in one of the stoutest pieces of Larch, and supported by three iron struts standing on the curbs. Another stout piece of Beech had a large bore through it, for the purpose of knowing when the tank was full, and putting in such things as dead rats or poultry, or ammoniacal manures. Now the items of cost, which would be pretty much the same in any locality, were these:

	£.	*s.*	*d.*
Clearing a space of ground, one man two days of 9½ working hours each	0	4	4
Digging out tank and wheeling away earth 20 yards off, one man two days	0	4	4
One man puddling, 4½ days	0	9	9
One man making road to tank, one day	0	2	2
Sawyer, for 298 feet of Oak	0	11	3
Ditto, for 50 feet of Fir	0	1	9
Carpenter, 3½ days making frame	0	9	11
Ditto, two days putting up	0	5	8
Ditto, two days making roof	0	5	8
	£2	15	0

My carpenter is a good honest fellow about the place, but proverbially a slow hand. I cut my own timber, and procured the clay in making a ditch for quite another purpose, and hauled the materials at a leisure time; and the quantities of timber and clay, and the cost of hauling, may be calculated from the foregoing labour account, to which I must add 1*s.* 7*d.* for nails. Being perfectly satisfied with this tank, I have only to speak of its durability. The party to whom I am indebted for the mode of construction is the farm-superintendent at Queenwood College, in Hampshire, a place which I think well worth the notice of agriculturists. They may see there some first-rate practical farming, done with ease and without bluster and pretension. Queenwood College is, in fact, a school for the classical and commercial education of boys, having some 800 acres of land attached to it, and professors of chemistry and other sciences engaged. Mr. Edmundson, the proprietor, has also an agricultural school for young men desiring both scientific and practical agricultural knowledge. Well, here has been, among other tanks, one like that above described in existence and sound condition for eight years, and it appears to me to answer every purpose of more expensive tanks.

For making drains into a tank, the following I find a cheap and sufficient method. In front of your pigsties, or some edge of the dung in the yard where the liquor oozes out from the central mass, make a tank about 18 inches deep and 1 foot wide, with any old half bricks placed circular, and about 6 inches of clay puddled at bottom and behind, and put a grating at top of it. Then, from just underneath the curb which holds

the grating, run a drain to the main tank, of machine-made draining pipes of 2 to 3 inches bore, laid in a little clay puddled, and about a foot underground. The cast-iron grating can be taken out, and the little tank cleaned with the hand when it gets too full of solid matter. It is true that you do not get much into the tank in dry weather; but in wet weather I can testify you may save a great deal of valuable stuff, which flows through the dung from the centre to the outsides of it; and then, the horses being probably disengaged, one can easily be spared to empty the tank upon some adjacent pasture, even though it should be filled daily, as mine was during some of the late heavy rains. And this makes the Grass grow too; so that I am quite satisfied that with judgment in selecting the place and time of construction, such a tank as I have described may be made a profitable adjunct to the farm. *Amicus Tull.*

TABLE, showing the Consumption of Food and the Increase of Animal per Week, for each 100 lbs. Live Weight, as recorded by various observers.

ECONOMY OF MANURES.

On Wednesday, July 31, a lecture on this subject was delivered in the Trades' Hall, by Dr. Anderson, the chemist of the Highland Society. He said: It has appeared to me that the present affords an advantageous opportunity of calling your attention to questions which must unquestionably depend for solution on the mutual exertions of science and practice. For I hold it to be certain that the two must go together, and that though some of the facts we require may be determined in the laboratory, there are many questions which, though suggested by science, can be established only as facts by experiments in the field, performed with every attention to care and accuracy. I hold also that neither of these methods of experiment will in themselves suffice; they must go hand in hand if our results are to be of value. Separately the chances are that they lead to mere speculations, of which science will supply one set and practice the other; for you must allow me to say that practice has abundance of speculations of its own, which are often much wilder than those on which science ventures. In discussing the general questions of the economy of manures on the present occasion, I must be contented to do so in a very general manner, as your time will not permit me to go into any details, and I shall advert, in the first place, shortly to the general properties of manures. If we examine then any of our common plants, we find it to be composed of a considerable number of chemical substances. These substances may be divided into two great classes, separable from one another by a very simple experiment, which is neither more nor less than burning the plant. When this is done we obtain its ash, containing the whole of one of these classes; the other has in the process of burning passed into the state of gases, and so escaped the observation of our unassisted senses. The former of these are called the mineral or inorganic constituents of the plant, the latter the organic constituents, because they are peculiarly present in all organised beings. The latter of these classes is a limited one, and contains only four substances—carbon, hydrogen, oxygen, and nitrogen. The former is much more extensive, and comprehends a considerable number, of which the most important are sulphuric acid, phosphoric acid, lime, magnesia, potash, and soda. Now the existence of the plant depends upon its obtaining all these, as well as one or two less important substances, in sufficient quantity; without these it cannot flourish, and just in proportion to the amount in which they are supplied will be the luxuriance of its growth. I say the growth of the plant will be proportional to the supply of these constituents. This statement however is not to be taken in its widest sense, because Nature has fixed a certain limit beyond which no supply of these substances, however liberal, will raise its growth, but up to that limit the statement is substantially correct. From whence, then, is the plant to derive these substances? And in answering this question it is necessary to distinguish between the two classes of substances to which I have already referred, and to inquire separately into the sources of each.

Of the inorganic constituents there can be but one source, the soil namely, which to be fertile must contain the whole of these substances in greater or less quantity. It is different, however, with the organic constituents, which have a two-fold source, and of which part, or even the whole, may be derived from the surrounding atmosphere. The atmosphere is in fact a great reservoir of the organic constituents of plants, of which it contains all four; two of these, nitrogen and oxygen, forming almost the whole of it; the other two, carbon and hydrogen, existing in smaller proportion in the forms, respectively, of carbonic acid and the vapour of water. It must be understood, however, that all soils contain a certain quantity of the same substances, in the form of what is called organic matter, in a state in which all these four substances may be supplied to the plant. Now every fertile soil contains all the constituents of the plants which grow upon it, and that too in sufficient quantity to supply many successive crops, a position which I have had recently an opportunity of illustrating in a very complete manner, in a series of analyses of the Wheat soils of Scotland, published in the last No. of the Highland Society's Transactions. I have there shown that even nitrogen, of all others the element which we should least expect to find in them in abundance, nevertheless exists in what must be considered a comparatively large proportion. But it is important to observe that it is not enough that these substances shall exist in the soil; it is further necessary that they be present in a state in which they can become available to the growth of the plant. Now, to provide for this, Nature has introduced an extremely beautiful and important provision. In order that these substances shall be absorbed by the plant, they must exist in a soluble condition. It is, however, very manifest, that if the whole valuable constituents were soluble, the good effects of such an arrangement would be altogether defeated, for the rains would soon wash away from our soils all that they contained of valuable matter. To obviate this, however, Nature has so arranged it that these constituents exist in the soil in the state of insoluble compounds, which under the influence of air and moisture, gradually undergo a series of very complex decompositions, which slowly liberate the constituents, as they are required to support the life of the plant. But Nature has fixed a limit to this change, and has caused these constituents to become soluble with extreme slowness only, and in no greater quantity than is requisite for supporting that amount of vegetation which the general economy of the globe requires.

Now the whole principle of cultivation is to obtain by proper treatment from a given surface of land a greater amount of vegetation than it is capable of producing in a state of nature. And this is effected partly by tillage, which breaks up the land, and by the admission of air and moisture facilitates the decompositions, by which these valuable constituents of the soil are liberated from their insoluble state. The other and far more important means is by the addition to the soil of those substances which the plant requires, in other words by the use of manures. A manure, then, ought to contain all the substances which a plant requires for its growth. And this is unquestionably what a manure of theoretical composition should do. Nay, more, it ought to contain these substances exactly in the proportion which the plant requires, so that no waste may occur. It must, however, be manifest to every one acquainted with agriculture, and still more manifest to every one acquainted with chemistry, that it is impossible to carry out practically what is true in theory; nevertheless, the aim of skilful and scientific practice ought to be to approach as near to theoretical perfection as it is possible to do, though in the very nature of things we cannot even hope absolutely to arrive at it, or even near it. Although, however, we cannot hope to arrive at perfection, we may advantageously aim at a somewhat lower and less difficult standard, for experience and science concur in showing that all the constituents of a manure are not as equally important, but that those are most essential which the plant has greatest difficulty in obtaining from other sources. Now, in this point of view, nitrogen is the most important of all the constituents of a manure, because it is that which Nature supplies least abundantly. You may possibly express some surprise at this statement, considering that I, not many minutes since, mentioned that it is at present in enormous quantity in the atmosphere. But it so happens that nitrogen is exactly of all others the substance which most peculiarly requires to be presented to the plant in a special condition. It has been established on most unequivocal evidence that the plant cannot absorb nitrogen as such, and that all this immense mass of nitrogen existing in the air is not strictly useful to the plant, while it is only a very minute quantity existing in it, in the state of ammonia, which is of immediate value. And of the immense disproportion between the amounts of nitrogen in what I may call an inert and an active condition, some idea may be formed when I mention that 100 lbs. of atmospheric air contain about 77 lbs. of nitrogen, and, according to a recent determination, not more than $\frac{1}{4}$ of a grain of ammonia.

Next to ammonia in importance may be placed phosphoric acid, which is likewise a comparatively rare natural product, and of which also the great source in animal and vegetable sources, all of which, but especially animal substances, contain it in quantity. It is true that it is found also in the mineral kingdom; but it exists there so sparingly that as yet scarcely any advantageous use has been made of that which is obtained from this source. You will observe, then, and it is a matter of great practical importance, that the principal source of the two most important constituents of plants is from plants themselves; for even that portion obtained from animals comes originally from the plants upon which these animals have fed. And the same may be said of potash, of which the great source is still from plants. This is a point which I wish to impress particularly upon you, that plants form the great source of these substances; and that this is true, not merely of these substances as manures, but even when you go into a druggist's shop, and buy pure ammonia, phosphoric acid, or potash, every atom which you get has at

some time or other existed in a plant or an animal. These observations lead me directly to the consideration of that manure which consists of the decomposing portions of plants, and that of course is farm-yard manure, the most important of all, that on which the farmer must always be mainly dependent, and, I think I may also say, that regarding the economical management of which we have the least amount of definite information. I beg it to be understood as my decided opinion, that farm-yard manure must always be the farmer's main stay.

Some people still seem to expect that some complete substitute will be found for farm-yard manure. I can assure you, however, that any such supposition is utterly extravagant, and is certainly uncountenanced by chemistry. I do not mean to say that chemistry could not produce a substitute ; but what I mean is, that the farm-yard manure must always be much cheaper than any substitute which could be manufactured ; and the reason is to be found in the fact, that the constituents of such a manure must be extracted from plants, which must necessarily be expensive. While even supposing that to be done, farm-yard manure must, in the very nature of things, still always be produced. No question can then be conceived of more importance than that of obtaining this manure in its most perfect state ; but how that is to be done is exactly one of those questions still unsettled, and which I believe to require very complete and careful field experiments. The exact chemical estimation of the comparative values of different specimens of this manure is a very difficult matter ; partly from its extremely complex nature, and partly from the many questions it involves. Of course, good farm-yard manure will contain more or less of all the constituents of our crops ; but, in estimating its value, we must be contented to take into consideration only its most important constituents, and, in this way, I conceive we may obtain a sufficiently near estimate, by knowing the amount of nitrogen and phosphoric acid which it contains ; but of these, for many reasons, the first is by far the most important, as it is in respect to it that the value of farm-yard manure appears to vary most. In the management, then, of farm-yard manure, two different questions require to be considered—first, the production of a manure containing the greatest possible amount of nitrogen ; and, secondly, the successful conversion of that nitrogen into ammonia. It is not unimportant, of course, that the other constituents of the manure should be present in abundance ; but it may be assumed, as generally true, that the treatment likely to produce the greatest amount of nitrogen will be that which will produce the most valuable manure in other respects.

In regard to the first of these questions, there is little information. It is a common statement, however, that the value of the manure is dependent upon the nature of the food with which the cattle which produce it are supplied ; that, for instance, cattle fed upon oil-cake produce superior manure to those fed on Turnips. I am aware that this opinion is not universal, as I have heard it disputed by farmers of skill and experience. I am inclined however to believe that the opinion is to a certain extent correct. Supposing, then, that two samples of such manure differ, it must be obvious that it is the dung and urine of the cattle which differ ; the litter mixed with such dung will be the same in both cases. Now, some experiments made in the laboratory, on the pure dung and urine of cattle fed on Turnips and oilcake, appeared to me to confirm the opinion of the greater abundance of nitrogen in the produce of animals fed with the latter food. It will not do, however, to draw conclusions in such cases from a single analysis, so that I was anxious to have repeated and extended the experiments, but circumstances not within my own control have hitherto prevented my doing so. I would beg you, however, to observe that supposing it to be made out distinctly that farm-yard manure produced by oil-cake contains more nitrogen than that from Turnips, still this would not embrace the whole question. It would if you were to buy the manure, when, of course, all that you want is to get as much nitrogen as possible in the 100 tons or any other quantity which you may wish to buy. But it is quite another thing when you come to produce the manure on your own farm. The question then is, not whether 100 tons of the one contain more nitrogen than 100 tons of the other ; but whether the whole quantity of nitrogen produced by the one method of feeding is greater than the whole quantity of it produced by the other. Now, we have no experimental information on this point ; but I think it may be doubted whether in this point of view there is any such difference, because you will observe that though oil-cake contains more nitrogen—in fact about 2½ times as much as Turnips—still there is a much greater disproportion in the quantities of these substances with which you supply the cattle. You give an ox daily 1 cwt. of Turnips, but no one gives 30 lbs. of oil-cake daily, but more nearly 3 lbs. ; so that, in fact, the ox fed on oil-cake actually on the whole receives less nitrogen than when fed on Turnips. To pass then to another question—supposing cattle to be fed in exactly the same way, so as in fact to produce manure which at the moment of formation is of uniform quality, what are the circumstances under which that manure can be preserved with the least loss of its valuable matter? As regards the general question of the preservation of manure, I apprehend that the most important matter is its protection from air and moisture. In the way a common dung-heap is made, we have, in fact, exactly the conditions to occasion loss of its valuable constituents. It is exposed to a more or less free current of air, which facilitates the volatilisation of the ammonia as it is formed ; and it is exposed to the falling rain, which washes out the soluble salts, and what ammonia the winds have spared, into the subjacent soil. It is true that the former of these sources of loss can be got the better of by the use of acids or of gypsum and mixing with earth ; but when the ammonia is thus fixed, as it is said, it is fixed only as regards volatility, for it is still soluble, and liable to be washed away by rain. In order to have farm-yard dung in the best state, it must be preserved under cover, and my impression is that the introduction of covered dung-pits is likely to prove of great importance. There seems to me no doubt that in this way manure, in whatever way produced, must be best preserved. There appears, indeed, to be but one objection, which is, the expense of erecting a roof of sufficient extent to cover the whole manure of a farm. But surely, in these days of cheap building, some sort of inexpensive cover may be contrived. In order to ascertain this, we should have to ascertain by actual experiment what is the amount of gain by having the manure kept under cover, so as to know whether it is sufficient to leave a profit on the expense of covering it. We have another matter to attend to also, in the management of farm-yard manure—its fermentation namely, by which is meant the production of such a decomposition as converts the nitrogen present into ammonia. The importauce of this decomposition depends upon the fact that by this means we obtain a manure which acts with greater rapidity than one in which this decomposition has not been effected. The fact is, that the formation of ammonia takes place much more slowly when it has been incorporated with the soil than when it is heaped up in the dung-heap ; and, as the nitrogen must pass into the state of ammonia before it is absorbed by the plant, we require to effect as much of that change as possible, if we are to have a manure of rapid action.

He had referred hitherto solely to natural manures, and he had laid before them his view that no artificial manure would ever prove a substitute for that of the farm-yard ; but though that was the case, they might be, and he believed were, most important auxiliaries. Let them take the commonest kind of artificial manure—he meant, of course, guano—the finest quality of which was the cheapest and the best of the class. He said the cheapest and the best ; and it must necessarily be so, because the constituents which were of greatest value to the agriculturist were given in it in a larger quantity than they could be got in any other compound for the same money. His advice then would be to buy the best guano—never purchase inferior. The inferior was greatly more expensive. The decrease in the money value for which it might be obtained was nothing to the decrease in its valuable constituents as compared with the better sorts. The Peruvian was the best kind of guano, and it was by far the cheapest. Farmers were exposed to much risk of imposition in this matter ; adulteration was carried on to an extent which it is difficult to credit. He had recently gone over the number of samples of guano that had been forwarded to the office of the society for analysis to the number of 30 cases, and he found that out of that 30 there had only been 9 samples of such a quality as he himself, if purchasing, would have been disposed to accept. And this gave no accurate idea of the proportion of good to bad guano that was in use. Numerous samples of good guano came to the office, but few of those that were thoroughly adulterated, because the venders of such took care to keep as far as possible out of the reach of the chemist. Let them take guano of the best quality and they would find that two things entered largely into its composition, viz., ammonia and phosphoric acid, the two substances, as he had previously stated, the presence of which was most valuable in farm-yard manure. Now, in Peruvian guano they would find about 17 per cent. of ammonia and of phosphate of lime, a compound of lime and phosphoric acid, 23, 24, or 25 per cent, according to circumstances. In inferior guanos there might be found 23 or 24 per cent. of phosphate of lime, and 1 or 2 of ammonia ; and this, instead of being sold at one-third of the price of the other, as it should be, was sold generally at two-thirds. Guano might be considered as the type of a class of manures, and bones might be taken as belonging to it also. The value of that kind of manure was dependent upon two conditions. Some used burned bones. Now, in certain circumstances, that might be advantageous. The addition of phosphate of lime might alone be needed to certain soils. Such a case occurred in the pasture land of Cheshire. The application of bones to that exhausted soil operated almost as a charm upon it. The peculiar nature of the tillage under which it had been kept—all the butter and cheese raised upon it being conveyed elsewhere—reduced it to that state that the addition of phosphate of lime acted powerfully, and was indeed eminently beneficial. But in general such would not be the case, and therefore they should give the preference to bones that were unburned. There was another instance of a similar kind to which he might refer. In many cases he believed that bones were sold from which the glue had been extracted by boiling. This glue was a valuable commercial product. It was used in weaving, for stiffening yarn and other manufacturing purposes ; and several manufacturers had large boilers in which the glue was extracted. The bones were sold afterwards at no diminution of price from that of unboiled bones.]

Home Correspondence.

Heather as Litter : its behaviour in the Dung-heap.—As you have requested a communication on this point, I will offer you one, although it is not derived from the source you hinted at—direct experience ; yet, in its absence, may be permitted to stand in its stead. The ultimate results of the use of Heather must be as varied as the relative state of vitality or decay in which it may be when used. When alive, it is charged with a sap which is an anti-ferment ; a bog may be received as its type. If such be removed to a dung-heap, it can derive but very little advantage from its new position. If put into a dung-pit, it is likely that in process of time an interchange may take place between the bitter sap of the Heather and the alkaline urine associated with the dung. Whenever this is accomplished, the act of rotting may be said to begin, and will be more or less active in proportion to alkaline preponderance. Dung-heaps are generally "fire-fanged." Dung-pits, which receive the undiluted urinary drainage of stables, yield the richest manure ever at the farmer's command. *W. E. Gill, Truro, Aug.* 5.

Land Drainage Company.—I was very glad to see that a company is being formed to carry out the Drainage and Improvement Act of last session, and trust the company's operations will not be limited to England. Many proprietors here (in Ireland) who obtained loans under the Landed Improvement Act, 10 Vict., cap. 32, have been very much impeded in their efforts by the want of sufficient funds to build offices, make farm roads, &c., for the money obtained under 10 Vict., cap. 32, was only to be expended in drainage or subsoiling in most cases. When an increased quantity of land was brought into cultivation, or rather made fit for cultivation, it was still unproductive from want of means to lime it, from difficulty of access, or from deficient stock or farm buildings. If the company lent money on the security of owners who had been borrowers under 10 Vict. cap. 32, I think they would be safe in most cases, as there was always an investigation as to title, before money was lent under that act. If they had an inspector or local agent, I am certain they could have the tenant's security besides the landlord's. *R. M.*

Artificial Manures.—Would Mr. Paine, of Farnham, kindly inform the public what artificial manures he puts on his Oats and Barley? Perhaps he would also give his experience as to the advantage of a top dressing for Wheat—whether the ammonia might not be more profitably employed as a spring dressing instead of an autumn one. *A Young Farmer.* [In reply to "A Young Farmer," at Tonbridge, I have time only briefly to observe that I apply no uniform dose of manure to my land, but such as experience and a knowledge of some of the properties of the soil dictate to me. As regards the application of ammonia to the cereal crops, I repeat that it is of no importance in what form it is given to the soil ; therefore apply that which gives the largest per centage of ammonia for your money. This is shown also by Professor Way, in his paper "On the Power of Soils to Absorb Manure," in the last Journal of the Royal Agricultural Society ; and it is confirmed by direct experiments made by Mr. Solly, and by Mr. Lawes, also, at Rothamsted, and I have experienced the same result in my more general practice. At the present time Peruvian guano (not adulterated rubbish), giving 17 or 18 per cent. of ammonia is the cheapest source of supply. But to return to the immediate questions of your correspondent. On a field from which all the Turnips were removed, I applied a mixture of 4 cwt. per acre of wet guano dried up with soot, the analysis of which gave about 8 per cent. of ammonia ; to this I added 2 cwt. of my fossil phosphate powder. This has given me a most excellent crop of Barley ; in fact, the straw is too heavy, and very much laid. Last year, after a large crop of pulled off Swedes, I put 3 cwt. of Peruvian guano, mixed with the same quantity of phosphoric marl per acre, and the result, as I have before stated, was a trifle over 8 qrs. of Barley per acre ; and in 1848, on a field of Barley, after Swedes fed off by sheep, and top-dressed when about 6 inches high with 84 lbs. per acre of the sulphate of ammonia, mixed with 2 cwt. of phosphoric marl, we omitted a few lands in different parts of the field, and we considered that we obtained from 12 to 16 bushels more Barley per acre on the top-manured portions. Last year my Oat crop averaged full 12 qrs. per acre ; we have now just finished cutting this year's crop, and we expect to obtain an average of 14 qrs. This crop is after Turnips and Swedes, about half of which were drawn from the field. When the Oats were sown 4 cwt. per acre of the guano and soot mixture with the fossil powder was applied. The land is naturally a poor gravelly clay resting upon chalk. A neighbour of mine, upon a similar soil, after trenching it, applied 6 cwt. per acre of Peruvian guano, and his crop is about equal to my own, while another neighbour in an adjoining field to my Oats, who farms in the old-fashioned way, will not grow much above a fifth of either of our crops. I ought perhaps to add that we do not obtain a crop of weeds as well as corn, it being our object to have no trouble in cleansing our Turnip fallows. If I had pulled off all my Turnips, I should have doubled my artificial manuring for my Oats. In manuring ammoniacally for Wheat, if the soil were a clay or stiff loam I would apply the whole dose in the autumn ; if gravelly or chalky, half at the time of sowing and the remainder early in March. Read Mr. Thompson's and Prof. Way's papers in the last Journal of the Royal Agricultural Society. Mr. Lawes' expe-

rimental Wheat fields corroborate this view ; so also do my own in a minor degree. Had I time to spare (which I have not), I could describe some experiments on a field of young Hops, which minutely confirm Mr. Way's inferences on the relative power of gravel, calcareous marl, and clay to absorb ammonia. In conclusion, when we have weak spots of corn in any field, we mend them with guano in the spring. P.S Have any of your correspondents suffered from what is termed the "finger and toe blight" in their Swedes this season? My crop upon the chalk subsoil is one of the best I ever had, but that upon the lower green sand (our best Turnip land), is quite spoiled. There is not one sound Swede in 50. When I first noticed the disease I thought my artificial manuring was at fault, until I examined other fields near, well dressed with dung, and found them equally bad as my own. I understand that this disease is very prevalent through all the lower green sand formation in this neighbourhood, extending over several miles of country. *J. Manwairing Paine, Aug* 16.]

Brief Notes on the Farming of the North Riding of Yorkshire.—The Vale of Mowbray is a fine extensive valley, varying much in soil and cultivation. In the neighbourhood of Thirsk, and northward, some of the land is well cultivated, forward, and productive, while other land of equal natural capability is ill cultivated, backward, and unproductive. Why is it so? Here is much light sandy or gravelly, and some stronger land, which, from being too light and dry, or too wet, and all of it of poor quality, was formerly considered unworthy of cultivation, but which, by superior management, is producing beautiful crops of Turnips, corn, and Grass seeds, and fattening fine flocks of sheep. While, on the other hand, there is naturally better and stronger land, made so poor and unproductive by bad cultivation and want of sufficient drainage, as to be, in its present condition, quite incapable of profitable cultivation, but which, by being underdrained, subsoiled and properly laid down to pasture for a number of years, might be restored to such condition that it would then repay the expense of superior cultivation. This land, naturally strong and wet, has been made far more so by wretched mismanagement ; having been for many years wearied and worn out by sowing two white corn crops after a bad summer fallow, with very rarely, if ever, a green crop intervening. Much moor land is devoted to game, which would pay for improvement by judicious cultivation. This is evinced by a few isolated proofs, exhibited in well cultivated farms, now maintaining large flocks of sheep, and growing good crops of Turnips, &c., where formerly only a few half starved sheep and cattle strayed, and where the heath bird flew. Why then do such extensive tracts still remain in a state of Nature, in this fine farming and manufacturing county, where there are so many good labourers who would be glad of more employment on reasonable terms? Is grouse more valuable than wool and mutton in this country? Is the game more worthy of preservation than the biped? Or are black moors more pleasing to the eye than thriving plantations or more extensive woods? The North Riding of Yorkshire excels as a stock-breeding and dairying country. It contains a very large quantity of old Grass land, and that is favourable for these purposes. But hay and pasture Grass are too much relied upon, and far too much Grass is mown for hay ; it is a most expensive and unprofitable kind of food. The meadows are sadly injured by spring eatage, which throws hay-time so backward, that though it is now the middle of August it is not quite concluded, although some of the corn is ready for cutting, and some little is already cut. It would apparently be desirable to cultivate a considerable portion of the best moor land and inferior old sward, and to lay down some of the old-going tillage fields, and to substitute chopped straw, enriched with Linseed compound, for a great part of the hay, as a few superior cultivators have done here with much satisfaction. Hay-making is generally pretty well managed here, where some good lessons may be learned ; but a little more labour might frequently be employed advantageously to expedite the work ; and a similar remark may be made with respect to hoeing. More hoeing would be very advantageously bestowed upon both corn and Turnips. The latter are generally drilled and looking well, but hoed only once or twice over, instead of three or four times ; and corn is too often sown broadcast, and, when drilled, but little hoed. Many farms in this country are seriously injured by unnecessary hedges, trees, and game, and by waste of liquid and other manure, and the benefits of irrigation seem to be quite overlooked. Many of the landlords and tenants appear to be enlightened and liberal-minded men, and as such it is to be hoped they will not be offended by these notices, but that they may be beneficially attended to, coming as they do from *An Observant Farmer, North Riding, Yorkshire.*

Boxes.—I have read many letters on the advantages and disadvantages of box-feeding, which appears to rest on the use or abuse of the particular system. If an ox is placed in a shed 12 or 14 feet square, well ventilated, and sunk 4 feet below the surface of the farm yard, the liquid manure drained off into a tank, and clean bedding supplied frequently, I imagine he must be in a very comfortable position. If, on the contrary, the beast is living in a den many feet deep, undrained, and permitted to lie in his own filth, he must be in a wretched state, and one in which no sensible farmer would keep an animal, unless he wished the ox to lose instead of gain flesh. I have certainly seen animals in boxes not well attended to, and suffering from the want of clean bedding, in consequence of the expense of straw ; in this instance the plan did not answer, and the boxes were very properly converted into stalls. But oxen are not in a better case when tied up by the head, unless the dirt is constantly swept up, and removed from under them. To see them standing in rows with their hind quarters covered with manure, from being allowed to lie down in their own droppings, is a most disgusting sight, and not uncommon. Whether cows and bullocks live in boxes or stalls, success depends upon the care of the master and farm servants, in keeping them warm, clean, and supplied with fresh air. When publishing statements of the diseases prevalent amongst cattle in particular districts, it would be interesting to ascertain how many are victims of neglect and bad feeding, &c. At certain seasons of the year, when food is scarce, what a lamentable state of leanness is observable amongst the store cattle on a farm—every rib may be counted, the hide is immovable and almost without hair. Half famished animals are more liable to disease when fed up for the market, than they would be if some little flesh had been kept on their bones. The sudden change from starvation to plenty brings with it many maladies. *Falcon.*

New Mode of Harvesting Grain.—The season of the year, and the article on harvesting in your Number of the 3d inst., both recal to my mind the subject on which I addressed you on a previous occasion—vide vol. for 1849, p. 474, July 28. You may remember that I then suggested a trial of harvesting only the ears of the corn crops, the straw from which the ears had been cut off in the field being stacked in any place most convenient for its subsequent employment, either as food or litter. My idea was so far taken up by an engineer in Devonshire, that he proposed to exhibit a machine at the late Exeter meeting for taking off the ears as the corn was reaped, and the machine was entered in the catalogue ; but on enquiry in the show-yard I found it had not been completed in time. Could this sytem be adopted, it would obviate the objections stated by your correspondent in your Number for the 3d inst. to the reaping of Wheat. Since I addressed you before, I learn that my plan was adopted some years ago by a farmer when incendiary fires prevailed, when for safety he decapitated his Wheat sheaves by means of an old scythe-blade, and stored the ears in his barn. Also I learn from a gentleman who was for some time travelling in Australia, that in part of that country where labour was very scarce, a machine was employed, pushed forwards by a horse, which travelled through the fields of corn, plucked off the ears as they grew, threw them into a receptacle, and I think rubbed out the corn at once as it travelled along. In this case the straw not being wanted for dung was left standing, and I suppose set fire to or ploughed in where it grew. I think, too, the Romans had a reaping machine on the same principle, which is mentioned in the interesting article in the "Quarterly Review," "On the Agriculture of the Ancients." Allow me, then, again to invite the attention of gentlemen disposed to make experiments for the advancement of agricultural knowledge to the important saving in harvest work, and in the subsequent operations of separating the corn from the straw, if a ready means could be applied of taking off the ears and storing them alone under cover without the useless incumbrance of the straw. Our ingenious mechanics might also perhaps apply their skill to the production, at the approaching exhibition of all nations, of a machine adapted to cut off the ears from sheaves of corn as they were brought to it from the reaper's hand. To tax our horse or steam power with the useless labour of driving through a threshing-machine a vast quantity of straw, only to spoil it, seems a very rude and primitive mode of proceeding ; a relic of treading out the corn by animals, or of threshing by flails. We must go a shorter way to work soon, I feel persuaded. *T. T.*

Bread.—Some regulation is much wanted to compel bakers to make their quartern loaves of a certain weight, so that the labouring man may know what he is entitled to for his money. It is astonishing the difference there is in the size of the loaf of one shop and that of another, although both profess to sell the same description of bread. Notices appear in the windows of shops, offering the quartern loaf at prices which seem reasonable till the bread is weighed on the second day, when it is discovered to be deficient by some ounces of 4 lbs. It may be said that men are not obliged to deal with individuals who cheat them ; yet, in a manner, they are under the necessity of submitting to the imposition, and thus it happens. Working men, who are out of employment, or who do not receive their wages regularly, are driven to the shops of persons who will trust them, and, to obtain this advantage, they must receive bread without inquiring about the weight ; the indulgence, such as it is, will not bear investigation. Many huxters sell beer as well as bread ; thus enticing their unfortunate customers to entangle themselves irretrievably in debt, bringing misery on their families and ruin on themselves. In consequence of the poor man having to live from hand to mouth, and not being in possession of ready money to take advantage of wholesale prices, he pays one-third more for most consumable articles than his neighbour who can command a few shillings to lay out in a stock of tea, sugar, Potatoes, bacon, &c. It is wonderful that the spirit of the labourer is not broken (I mean the hard-working animal), who knows well enough how circumstances are against him, and yet toils on with little hope or prospect of bettering his condition, whilst he sees the idle and profligate flourishing. Indeed, it is extraordinary to think how many able-bodied youths, from 17 to 25 years of age, live without scarcely ever performing a day's work. They must exist on plunder of some sort. A strict police, and summary punishment before a couple of magistrates, in the shape of a severe flogging, would check such marauders. *Falcon.*

On Farm Buildings.—A very valuable improvement has been lately suggested in the erection of farm buildings, that the whole area be roofed over like the terminus of a railway. This idea is very little known, and will, no doubt, have to contend with much opposition. It will protect the animals, prevent the heavy rains from injuring the dung, and protect the manure from being dried on the surface by the hot suns of the early summer. For such roofs, corrugated iron is the most proper, as its own strength will stand over a moderate width, and it does not require any supporting substance on which to be laid. The asphalted felts are combustible, and require an under roof, on which they are fixed, and on both these points they are inferior to the corrugated iron. The three wings of the farmery will be roofed over with the thin iron, at the common elevation, in covering the width of 20 feet over walls ; three rows of roofing will cover the interior of the farmery, and may range north and south, and will rest on cast-iron pillars, which are placed in the subdivision walls of the feeding yards. The roofing can extend over the rickyard and the railway, and place all under one roof. If agriculture would look to the mighty, and at the same time the very convenient joint performances of machinery and railways, it would quickly perceive that many useful modifications of their utility might be introduced into the practical operations of its own departments. It may be very reasonably proposed, that all the articles of agricultural produce, which are changed in form for the purpose of being used, should be placed on the second floor of the farmery, or carried to it, and hence let down in the prepared form in the places where they are wanted. When it is preferred to cut the Turnips into slices and the hay into chaff, and when the incontestible improvement comes into use of cutting all straws that are used for litter—then it is evident that all the articles in the crude form must be placed on the higher floor, and descend from it in the prepared condition. In the improved use of threshing machinery, the unthreshed grain is raised from the ground-floor to the feeding board by means of a travelling carrier that is driven by the machinery ; or it may be carried from the ricks to the second floor on a high railway, that is placed to the necessary height. The grain from the ricks is laid upon a light waggon, which runs upon the railway to the feeding board. The power of steam will drive machinery to almost any extent ; and cutters may be placed on both sides of the engine for the purpose of cutting the straw, hay, and roots. The straw may be taken as it falls from the shakers, and put into the adjoining cutters of the kind to cut it into lengths of 3 or 4 inches for the purpose of litter. The hay may be cut into chaff by cutters closely adjoining. On the other side of the engine the roots may be cut by a similar application ; and can be raised to the box of the knives by a narrow travelling carrier from the ground floor, and in quantity as the cutters are able to manufacture. The cut food may be laid in stores, whence it can be carried in light waggons on railways to the required places, and let down in spouts. The railways for this purpose must run to the necessary positions for feeding cattle and horses, and for strewing litter over the yards. It is a good thing to have a railway on the ground between two rows of ricks, on which a waggon conveys the grain to the lower floor of the barn, whence a travelling carrier raises it to the second floor, where the machinery receives it to be scutched. A suggestion not much different, places the railway between the rows of ricks on cast-iron pillars, that stand at the height of the second floor of the machinery, and on which the grain is carried by a waggon to the feeding board. A third idea may be published, that the ricks of grain stand singly on four-wheeled platforms resting on a branch railway at a sharp angle of divergence with the main trunk, which leads to the threshing barn. When the rick is wanted to be threshed, the platform is run along the railway which inclines gently to the barn, where an outside shed receives the rick under cover from rain, during the time of threshing. The barn stands across the railway, and receives the rick without the labour of turning such a heavy body to a cross direction. The platforms are returned to the position on the branch railway, in order to receive a rick of the next year's growth. The ricks and machinery are covered by the corrugated iron roof of the farmery extending over them. The suggestion of having a second floor over the entire area of farm buildings, on which to perform all the manufacturing work in the preparation of the different articles for use, may be reckoned a chimera, or a wild sally of the imagination, and with it will be classed the idea of placing each rick of grain upon a four-wheeled platform, and running them entire to the barn, as each may be required to be threshed. But from a due consideration, there certainly appears nothing improbable in the feasibility of its adoption, and nothing impossible in the application and execution of the various parts of the composition. It is only an extension of the principle that has already been used on a minor scale and for smaller purposes. *J. D.*

Mangold Wurzel.—This root is now beginning to be more extensively cultivated in South Hants; not that the Swedish Turnip is a root less esteemed, for it is unquestionably one of the most valuable to the farmer;

cows, pigs and horses, poultry, and even dogs will eat thereof. The Mangold Wurzel this year has failed in many places, partly from the dry weather, and in part arising from bad management. In the first case the seed was deposited too shallow, and in the latter instance it was drilled upon the flat. The fly was said, also, to have destroyed the plant. This year I noticed the attacks of it for the first time; but the plants recovered, and are now looking well and strong. I fancy the fly has been wrongly charged with this crime, and the failure entirely arises from not depositing the seed in moist earth. Where the land is clean, well pulverised, and the seed carefully deposited, there is no failure; and I may add, let the crop be sown before the month of May. There is no question but "baulking" and dibbling is the surest and best method of raising this root. Even where short or long farm-yard manure is applied to the drills, a mixture of guano and ashes, or sifted short dung, dropped with the seed, will secure a regular and more even plant. By this method we have a fine plant; and even where only dung was applied in rows, and the seed drilled upon the top of the "baulks," and then rolled down, I have seen an excellent crop this year. *X. Y. Z., Hants.*

Agricultural Prints and Drawings.—Surely in 1850 an artist ought to be able to draw a plough, a harrow, or a yoke of oxen or horses when "hatched" (which, no doubt, means "attached") to a plough; but when any operation of farming is introduced into a drawing of rural scenery, and fields, the horses are wrongly yoked, or walk in the wrong furrow, or are passing up the wrong side of a ridge. The plough is all wrong, the harrows no one could imagine by whom made, save and except the painter. The furrow slices are laid all one way in a ridge. Divers other curious deviations or misrepresentations of our implements of peace might be added; but I really think that we who live in the country, love the country, and admire the "gear" of the husbandman, should have the pleasure of seeing it properly and faithfully delineated. *X. Y. Z., Hants.*

Land Improvement Company.—You allude in your last Number to the Land Improvement Company. I have obtained a copy of their act of incorporation, and am surprised at the extensive powers conceded to that company—powers which the House of Commons distinctly refused with reference to the improvement money proposed to be lent by Government. I allude more particularly to the power of erecting buildings, without which, in many cases, all other improvement is incomplete. This Land Improvement Company, if properly worked, will confer very great benefits upon agriculture. I have no doubt that the proprietors of entailed estates will be most anxious to avail themselves of its provisions. I am not so sure that the money will be forthcoming. After what has happened within the last 10 years, capitalists are naturally suspicious of joint stock companies. If you will draw public attention to the provisions of the Land Improvement Act, and to the advantages it offers as a pecuniary investment, you will do good service to the cause of agricultural improvement. *Rusticus.*

Manure for Grass Land.—I was anxious to know what quantity of Grass could be procured by stimulating manures, by experiment. This experiment has been made on 100 superficial yards of Grass land; and by manuring after every crop, I have mowed five times, and have had each time as much Grass on the land as what there usually is when persons mow for hay. The manures I made use of were pounded charcoal, malt-dust, muriate of ammonia, sulphate of magnesia, and nitrate of soda. The salts were put on in a liquid state, 2 oz. to each yard. I mowed the fifth time on the 10th of August. The land is by no means good land on which this experiment was made, and which is not yet completed. These manures will give to very poor land the appearance of very good land, as long as their effects last. *C. A. A. Lloyd, Whittington, Oswestry.*

Farm Memoranda.

Farming at Ury, N.B.—I felt the more satisfaction on reading the details on high farming, as it is termed, by Mr. Baker in his address to the London Farmers' Club, as they correspond in a great measure with my own practice. Some few things I differ with him on, such as devoting the whole of the farm-yard manure to grain crops and depending on artificial manures for the raising of green crops. I shall presently show that my practice is the reverse; but most of all do I object to his rotation of cropping, where he speaks of taking Oats or Barley after Wheat. The taking of two grain crops in succession, without the intervention of a fallow or green crop, has long been denounced in this country (Scotland) as contrary to the rules of good husbandry, and the tenants in their leases (for all farms in Scotland are let on leases of not less than 19 years) are prohibited from doing so. I have now been a practical farmer, farming my own property on a large scale, for nearly half a century; for the last 30 years I have devoted my whole energy and attention to the business, and certainly cannot be taxed with committing the details of the operation to others. Now, my mode of management is this: I follow a rotation of five on some farms, on others, of particularly good land, of seven—Oats, Turnips, two-thirds fed off on the land, Barley and spring Wheat sown out with seeds, and two years in Grass, for the most part gnawed with Leicester sheep; or Oats, Beans, and Peas drilled and manured, Wheat, Turnips, Barley with seeds, and two years in Grass. I give the whole of my grain crops a stimulus of 2 cwt. per acre of Peruvian guano, and apply the whole of my farm-yard manure to my green crops, with an addition of guano or bones. No doubt a good fair crop of Turnips may be raised by artificial manures, but you cannot raise anything like the same weight per acre as with 18 or 20 tons per acre of well-made farm-yard manure. I keep all my beasts in winter in straw yards, divided in lots of 10 to 15; these yards are surrounded with covered sheds 20 feet wide within walls, and with mangers for feeding with cut Turnips, &c., and spouted round. About the first week in February I clean out the whole of my yards, carting the manure to the most distant part of the farms intended for Turnips, drawing the horses and carts upon the mound, and, when completed, giving the mound a covering of earth on the top. It thus remains until about three weeks before it is applied to the land, when it is carefully trenched over, and soon takes a fermentation, and the operations of setting out the drills, covering in the drills, and sowing the Turnips, all go on at one and the same time. The manure made after February remains in the yards until the cattle are turned out to Grass about the 1st of May, when it is loosely thrown up, and devoted to the green crops nearest the farm steadings. I have about 800 acres of fine old pastures, laid down by my father more than half a century back, consisting of the best land upon the estate; one-half of this I retain in my own hands, the other half is let by auction yearly for the grazing season—that is from the 1st of May to the 1st of November. It then reverts to me, and generally lets at about 3*l.* per acre. The cattle are turned on the old pasture, and I devote the one and two year old Grass on my arable farms to my Leicester flock, until about the 1st of November, when the ewes are sent on the old pasture for the winter, the hogs and others put on Turnips, and the cattle removed to the straw yards. I know not whether Mr. Mechi and other great doctors of the present day will style this system high or low farming, but this I do know, that last year I would have readily backed 100 acres of Turnips, composed of Swedes, yellow and Northumberland Globes, against any hundred acres in the kingdom in one man's possession. I now come to the main question, does this pay? The price of Oats last spring and this summer is, in this county, about 13*s.* per qr. of 40 lbs. per bushel—8*d.* per bushel additional for all above that weight. Barley, 53 lbs. per bushel, 16*s.*—8*d.* additional per bushel above that weight. Wheat 30*s.* to 35*s.* per quarter of 62 lbs. per bushel—1*s.* per bushel above that weight. The farm I now occupy, when on lease, and farmed in a fair manner, some years back made a return, I shall say of Oats of about 5 qrs. per acre—that at the average price, under Protection, of 24*s.* per qr. or 18*s.* the Scotch boll of 6 bushels, paid about 6*l.* per acre. By furrow-draining, subsoil-ploughing, and the application of 2 cwt. per acre of guano, I have increased my Oat crops to 8 qrs. per acre, and other grain crops in proportion. Well, 8 qrs. of Oats at 13*s.* gives a return of 5*l.* 4*s.* per acre. Deduct 1*l.* per acre for guano, and 5*s.* per acre for interest of money for furrow-draining, reduces the return to 4*l.* per acre. I am thus 2*l.* per acre worse than with the moderate return of 5 qrs. per acre under Protection, which, in point of fact, is 10*s.* per acre more than the valued rent of the farm. *R. Barclay Allardice, in Bell's Weekly Messenger.*

Mr. Owen's Farm, near Liverpool.—Mr. Owen's farm, Lower house, West Derby, near Liverpool, contains 153 acres. The soil is a strong brown loam of a fair depth, and resting on a stiff clay subsoil. The farm has a slight inclination to the east, and the elevation above the sea, perhaps 50 feet. This year it is occupied in the following crops.

	A.	R.	
Old meadow and pasture	10	2	very good and clean.
Clover and seeds mown	68	2	ditto ditto.
Wheat after Potatoes & Turnips	32	2	very heavy & clean crop.
Oats after Ley, 7 acres } do. do. Wheat 13 „ }	20	0	ditto ditto.
Potatoes, 7A. 1R. } Turnips, 9 1 } Beet, 2 0 } Green Crops	18	2	exceedingly clean and well ordered.
Orchard and Garden	1	2	well kept and fruitful.
Homestead and roads	1	2	good order and neat.
	153	0	

Rotation of crops, 1st Potatoes, Turnips, and Beet, after Grass or Oats; 2d, Wheat, one-third sown with Clover and Grass seeds; 3d, one third Clover and Grass seeds mown, and two-thirds Oats, sown with seeds; 4th, 5th, and 6th, cut for hay. Stock kept are 7 horses, 1 bull, 14 dairy cows, improved short-horns, 5 pigs, total 27. In September and October, every year, grazes from 100 to 200 sheep on after-grass. In summer the stock is kept on pasture, or Clover in the stall, grains, and Egyptian Beans. In winter on hay, grains, Turnips, small Potatoes, Beet, oilcake and a little bran. About 200 tons of manure is made on the farm every year, which is principally applied to the Potato, Turnip, and Mangold Wurzel crops; and the remainder to meadow. Purchases about 600 tons of stable dung, at Liverpool, at a cost of 6*s.* per ton, exclusive of carting. This is mostly applied to the meadows. Has drained the whole of the farm since he entered upon it, 15 years ago, at the rate of 10 acres a year. The drains average 6 yards apart and 3 feet deep. The main drains are open stone drains, and the parallel ones filled 1 foot with cinders. The whole cost about 7*l.* per acre. 14 acres have been marled with 100 cubic yards per acre. The general improvements have been road making, filling up pits, draining, eradicating old fences, planting new ones, and erecting buildings. Mr. Owen's farm lying near Liverpool (5 miles) a considerable portion of the hay, straw, and roots are disposed of there, and manure purchased in return. There is no urine tank upon the premises; but all the liquid manure is carefully collected and thrown over the dung heaps, and other absorbants at intervals, which Mr. Owen considers quite answers as good a purpose, the manure being of far greater value than if the urine were drained into a tank. The land, when sown down, lies three years and mown every year, but has two dressings of dung, or compost during that time. The farm has been remodelled: not a vestage of any old fence remaining. New thorn fences have been planted, and which are well kept. The fields are large and of an oblong square, with pools constructed so that each will serve four fields, with a constant supply of water from the drainage into each. The ditches and water courses are clean and open. Carriage and cart roads, gates, posts, foot paths, styles, farm yards, &c. in perfect order. The following is thought worthy of recording, although no premium was awarded. There is very considerable merit in the cultivation of the farm, and in some respects peculiar. So far as the arable part, quite equal to Mr. Owen's farm, but a little deficient in the Grass part. It is owned and occupied by J. I. Blackburne, Esq., of Hale hall; the farm is within the park, and under the management of Mr. Nixon. It consists of 236 acres; lies on the banks of the Mersey, 10 miles from Liverpool. Is very gently undulated, but every part so far above high-water mark as to afford sufficient fall for perfect drainage. The soil is light sand and peaty loam, and the subsoil on some parts sand, and on other parts clay and sand. In 1849 was cultivated as follows.

					A.	R.	P.
Old meadow and Pasture					92	0	0
Clover and seeds mown					45	0	0
Wheat after Potatoes			9	0 0 }			
do. after Turnips and Beans			11	0 0 }	20	0	0
Oats after ley					24	0	0
Barley after Turnips, &c.					12	0	0
Beans	5	0 0					
Peas and Vetches	2	0 0					
Potatoes	20	0 0					
Turnips	10	0 0	Total Green Crops		41	0	0
Beet	2	0 0					
Carrots and Cabbage	2	0 0					
Homestead, roads, &c.					2	0	0
					236	0	0

The rotation adopted is 1st, Oats after Clover or Grass; 2d, green crops cultivated in drills; 3d, Wheat or Barley; 4th, Clover and seeds mown; 5th and 6th, pasture. The stock kept consists of 8 horses, 25 colts (ley stock), 3 bulls, 12 dairy cows, improved short-horns, 100 heifers (ley stock), 5 calves, 100 sheep, 40 pigs; total 293. The horses are fed on steamed food in the winter, and green food in the summer, with one bushel, each, of crushed Oats and Beans per week. From 300 to 400 tons of manure is made every year on the farm, and which is entirely used for green crops. The liquid manure is received in tanks, and carried by water-carts to the meadows. From 8 to 10 tons of guano, bones, and superphosphate of lime is purchased annually, and chiefly used to Grass land, Turnips, and early Potatoes. About 100 acres have been drained with tiles, the drains from 3 to 5 feet deep. A considerable portion of the land is old Grass, and occupied in grazing stock. The herbage of some portions of this might be much improved, both in quantity and quality, by the application of marl, or sea sludge (which lies convenient), lime, or bone manure. All these improvers have been applied to portions of it, and they all appear to answer well. Some parts of the farm, which had been old Grass, and unproductive, has been very much improved by breaking up, and undergoing a judicious course of cropping, and then laid down again to Grass. The management of the arable part of the farm could not well be better. The corn crops were all very heavy and very clean, the Barley too good. The Beans an average crop and tolerably clean. Potatoes, Turnips, and Beet looked exceedingly well when inspected in August, very clean and well ordered. Cabbages a heavy crop and ready for cutting. A considerable breadth of early Potatoes are planted, which are sent early to market, and the land afterwards either planted with Swedes or sown with yellow Turnips; 1½ acre of Potatoes early disposed of produced 70*l.*, and, on the same land a promising crop of Swedes was growing when I and Mr. Dixon inspected the farm. On other portions where the Potatoes had been sold off later, healthy crops of yellow Turnips were growing. The fences, roads, &c. were well kept, and there is little doubt but a fair and favourable balance sheet could be shown. *Rothwell's Agriculture of Lancashire.*

Miscellaneous.

Small Farm and Agricultural Schools.—In the "Farmer's Herald" of January, 1844, I wrote the following account of the management adopted upon a small farm in this county, upon the principle of green crops and Grasses, without any grain. It is occupied as a small agricultural school, and is situated in the township of Orrel, near Wigan; and in the occupation of the Rev. John Holgate. Since this was written it has changed ownership once or twice, during which transitions it has been for a few years rather neglected, owing to insecurity. It is now, however, under sufficient security of tenure, and the same principles of cultivation are adopted. I insert it not only as an example of superior management, but also as showing

in what manner the rising generation of small farmers and agricultural labourers may be instructed in the rudiments of a plain education, combined with a knowledge of their calling in life. The farm contains 7 statute acres, including the sites of buildings, yards, &c. The land is light, and was a few years ago very poor, and is not of the best description of light soils. In these 7 acres there were, 12 months since, a coalpit and a road quite across the farm; these are now quite done away with, and their sites, by very considerable labour, made into cultivable land, so that the whole farm will be under full cultivation next year. The following is the amount of produce this year:—Five short-horned milch cows have been kept through the summer. On the 14th of this month there were, on the premises, 6 tons of hay, 7 tons of Mangold Wurzel, and 18 tons of Swedish Turnips. This produce will keep the same cows well till June 1st next year, as it will afford each cow the following weight of food each day—15 lbs. of hay, 18 lbs. of Beet, and 47 lbs. of Turnips; total, 80 lbs. each. There are also several cwt. of prime Onions which will go to the market, and, in the course of the season, there has been 15*l.* worth of early and late Potatoes sold off the land, and the family of the master supplied with vegetables the whole year. The cows are kept the year through in the stall or yard: in the summer with Italian Rye-grass and a little Clover amongst it; and in the winter, on hay and roots. 1st, root crops; 2d, Grass, sown after the root crops; 3d year, Grass. Of course the land will be ultimately one year in roots, and two in Grass. No grain is cultivated. The cultivation adopted is as follows: In the winter, the second year's Grass is pared off. This is trenched under, and the bottom of every trench is loosened by a fork, so that about 18 inches of soil and subsoil is stirred. In the spring a part is planted with early Potatoes, a part with late Potatoes, and the rest sown with Beet and Swedish Turnip. When the early Potatoes are cleared off the land, by about the middle of July, it is sown with Italian Rye-grass, and is cut once the same autumn. This part can be cut four times the year following, and twice or three times the second year. The land which grows the late Potatoes, Turnips, &c., is sown with Italian Rye-grass in the spring following (March), and is cut twice that year, and occasionally three times. Dung is applied to the root-crops in drills, as they are cultivated by that method, and kept clean by the hoe and the spade. The liquid manure is applied to the second year's Grass. The labour is all performed by hand, with the boys of the school, except a few particular jobs, which are done by men. The master of the school assists at the labour, and has all the management of the land and the school. The boys, whether in trenching, delving, or hoeing, having each their lot to work upon, so that an idle boy is soon detected. Parents and guardians of boys in this school are expected to enter them for 18 months, on the condition of the following rules:—1. The boys are to be in the school three hours each day during six days of the week, and three hours at work on the land. 2. In the school they are to be taught reading, writing, arithmetic, English grammar and geography; and, in addition to Scriptural instruction, they will be taught the best methods of cultivating land. 3. During the first three months the boys received their instruction as a remuneration for their work; the second three months they are to receive 6*d.* per week in addition to their instruction, and an advance of 3*d.* per week at the beginning of each succeeding three months. 4. Any boy being absent from the school, without permission from the master, shall for each half day forfeit 1*d.*, to be deducted from his wages. *Rothwell's Agriculture of Lancashire.*

Notices to Correspondents.

ABORTIVE EARS: *Cymro.* We are unable to account for the case. If the grain was pulpy, the disease must have shown itself much earlier, and more abruptly than it generally does. For with us, this blight generally approaches so gradually, that the grain dries up before half formed, and the whole plant turns white but little before the general ripening of the crop.

BONE-STEAMING: *A G.* In further reply to "A. G.'s" enquiry, the steaming is continued 24 hours, the maximum pressure (at the safety valve) 28 lbs. on the square inch. The details, with a cut of the apparatus, are given in No. 27, Jan., 1850, of the Scotch Quarterly Agricultural Journal, p. 193. *J. Prideaux.*

CHINA GEESE: *A H.* We do not remember the advertisement alluded to. For profitable increase of young there is no goose to compare with the common domestic kind of a good stock. The China geese, both white and brown, are copious layers, and the goslings, when hatched, are as easily reared as any others, but they are less to be depended on for the fertility of their eggs, and as steady incubators. If these be selected for their ornamental value, take care to purchase healthy *young* birds, and let no other gander associate with them, either in their pasture or the water to which they have access. *D.*

CHICORY: *Upsilon.* Sow early in May 3 or 4 lbs. of seed, in rows 12 inches apart, in deeply, cleanly, and richly cultivated land. Keep hoeing between the rows, and single out to distances of 6 or 8 inches in the rows. The seed does not "come" for four or five weeks, therefore sow some Oat or Turnip seed with it to mark the rows, in order that you may hoe earlier than you otherwise could. The crop is taken up in October and November, washed, cut in small pieces, and dried in a kiln, which takes 7 or 8 out of the 9 tons of which the crop per acre may consist. It is then marketable, and may be sold to any dry-salter or wholesale grocer for perhaps 20*l.* per ton.

DRAINAGE OF SHALLOW PEAT: *F H C.* We do not see anything in the variety of the strata, to render any change in the ordinary practice necessary; and we should therefore place the drain about 3 feet 6 inches deep, and about 24 feet apart, using 2 inch pipe tiles.

FOOD FOR STOCK: *D.* Vetches sown now, if they had favourable circumstances, would be ready, though hardly full grown, before winter. Clover sown now would be ready in May or June next. Cattle will not eat Fern.

IMPLEMENT CATALOGUE AT EXETER: *J E G.* You had better apply to the Secretary of the English Agricultural Society.

LIME: *P.* To add lime in the autumn to land manured in spring is not bad policy. It would not be easy to burn clay on the top of lime kilns; because the operation of burning lime is a continuous process, a continual addition at top and an abstraction at foot of kiln.

MALT WASTE: *Thos. Jones.* It is useful as *food.*

PERUVIAN BARLEY: *W G E.*, who has this season given this sort of Barley a trial, and whose crop has greatly suffered from the effects of the late frosts, would be glad to know if others have suffered from the same cause, and how this sort of Barley is generally looking.

PIGS: *A B.* Porkers, 20 weeks old, ought to be worth more than 22*s.* 6*d.* a-piece. Stone Turnips may be 8 or 16 tons per acre, and they may last through a mild winter, or be destroyed by the first severe frost; it is therefore impossible to answer your question. Nevertheless, you may make a tolerable guess yourself, by calculating the consumption of sheep at a quarter cwt. daily a-piece.

POULTRY: *J F.* Mr. Dixon's work on poultry describes the subject in the manner of a naturalist, as well as in that of a poultry keeper. It does not contain anything on rabbits. The "Boy's Own Book" is, perhaps, sufficiently instructive on that subject.—*Country Curate.* Chickens confined in a yard may be permitted to eat Lettuce freely, or any other garden vegetable, as Cabbage, Spinach (ran to seed), &c., provided they are at the same time supplied with as much as they will take of grain or mixed meal food. Give them now and then, as a treat, a green turf, like those cut for larks' cages, only larger. *D.*

POULTRY DISEASE: *I J F.* Your "case" has been sent to "*D.*"

SWEDISH TURNIPS: *W G.* We have heard a good deal of the injuries they are receiving by wireworm. In the North they have an excellent crop. We cannot say whether there is generally an over tendency to grow leaf rather than bulb.

THE EPIDEMIC: The disease no doubt is "The Epidemic" of 1840. Give each the following, dissolved in gruel:—Sulphate of magnesia, ½ lb., sulphate of potash, 1 oz., nitrate of potash, 6 drs., tartarised antimony, 2 drs., and repeat the following day. Apply to the sore feet the following lotion, keeping the parts clean:—Sulphate of zinc, half an ounce; alum, 1 ounce; water, one pint. *W C S.*

TURNIP GROWING: *Anti-humbug* makes an unreasonable criticism. We are by no means indiscriminate admirers of Scotch farming.

WHEAT MIDGE: *A Correspondent* asks for information on this subject. We beg to refer him to vol. ii., Journal of Royal Agricultural Society, p. 22, &c., which refers to what was previously known, in a report on the diseases of Wheat, 1841; vol. iii., do., p. 36, a few additional memoranda towards elucidating their history, and a suggestion how to diminish their ravages, 1842; vol. vi., p. 139, a full account by J. Curtis; *Gardeners' Chronicle* for 1847, p. 604. These accounts leave the *practical* part of the question much as it was left in 1842, but the next step in the inquiry has been made on the other side of the Atlantic, and you will find it recorded in "Annals of Natural History" for February, 1850, p. 152.

Markets.

COVENT GARDEN, Aug. 24.

Vegetables are abundantly supplied; Hothouse Grapes and Pine-apples plentiful. The supply of Peaches and Nectarines is well kept up. Gooseberries fetch from 2s. 6d to 3s. 6d. per half sieve. Oranges and Lemons though scarcer are sufficient for the demand. West Indian Pine-apples are not quite so plentiful as they have been. Plums and Pears are still received from the Continent. Filberts are coming in very plentifully. Carrots and Turnips may be had at 3d. to 6d. a bunch. Potatoes are plentiful and cheap. Lettuces and other salading are sufficient for the demand, and so are Mushrooms. French Beans are scarcer. Cut Flowers consist of Heaths, Pelargoniums, Lily of the Valley, Carnations, Picotees, and Roses.

FRUITS.

Pine-apples, per lb., 4s to 6s
Grapes, hothouse, p. lb., 2s to 5s
Peaches, per doz., 4s to 15s
Nectarines, per doz., 4s to 15s
Apricots, per doz., 1s 6d to 5s
Cherries, per lb., 1s to 1s 6d
Melons, each, 2s to 4s
Gooseberries, per half sieve, 2s 6d to 3s 6d
Currants, p. half sieve, 3s to 4s
Raspberries, p. pottle, 4d to 6d
Plums, p. punnet, 1s to 1s 6d
Green-gages, do., 1s to 2s
Apples, dessert, p. bush, 4s to 8s
— kitchen, do., 1s 6d to 6s 6d
Lemons, per doz., 1s to 3s
Oranges, per doz., 2s to 3s
— per 100, 8s to 24s
Almonds, per peck, 6s
— sweet, per lb., 2s to 3s
Walnuts, p. 100, 1s 6d to 2s

New Hay	55	65	Straw	24	28
Old Clover	78	85			

HOPS.—Friday, Aug. 23.

Messrs. PATTENDEN and SMITH report that there is a good retail trade for the few 1849's left unsold, but not much inquiry for other sorts. Another packet of the new growth has arrived, which is much better than the last, although very unripe. The price asked is 8*l.* 8*s.* Duty 200,000*l.*, with little disposition to back it, the nights being very cold and unequal.

SMITHFIELD, Monday, Aug. 19.

We have fewer Beasts to-day; however, the demand is less, and trade is no better than on Monday last. The supply of Sheep is not quite so large. Trade is cheerful, at fully late rates. Trade is heavy for Lamb; our top quotation is reached only in few instances. Calves are not so plentiful; some choice ones make a little more money. From Holland and Germany there are 763 Beasts, 2330 Sheep, and 155 Calves; from Scotland, 200 Beasts; and 2200 from the midland counties.

Per st. of 8 lbs.—	s	d	s	d
Best Scots, Herefords, &c.	3	8 to 3	10	
Best Short-horns	3	6 — 3	8	
2d quality Beasts	2	10 — 3	4	
Best Downs and Half-breds	—	... —	...	
Ditto Shorn	4	0 — 4	2	

Per st. of 8 lbs.—	s	d	s	d
Best Long-wools	...	to	...	
Ditto Shorn	3	6 — 3	10	
Ewes & 2d quality	...	—	...	
Ditto Shorn	3	0 — 3	4	
Lambs	...	4 0 — 4	8	
Calves	...	2 8 — 3	8	
Pigs	...	3 0 — 4	0	

Beasts, 3701; Sheep and Lambs, 29,350; Calves, 248; Pigs, 200.

FRIDAY, Aug. 23.

The supply of Beasts is considerable, so also is the demand. Prices are the same as on Monday. The number of Sheep is large, but the average quality is by no means good; consequently the choicest descriptions are as dear as of late; trade is slow for second-rate. Lamb is lower, the season for it being far advanced. Calves are plentiful; they make about the same as on Monday. From Germany and Holland there are 414 Beasts, 3060 Sheep, and 324 Calves; from Scotland, 100 Beasts; 300 from the midland counties; and 92 Milch Cows from the home counties.

Best Scots, Herefords, &c.	3	8 to 3	10	Best Long-wools	... to ...
Best Short-horns	3	6 — 3	8	Ditto Shorn	3 6 — 3 10
2d quality Beasts	2	10 — 3	4	Ewes & 2d quality	... — ...
Best Downs and Half-breds	—	... —	...	Ditto Shorn	3 0 — 3 4
Ditto Shorn	4	0 — 4	2	Lambs	... ... 4 0 — 4 6
				Calves	... ... 2 8 — 3 8
				Pigs	... ... 3 0 — 4 0

Beasts, 1098; Sheep and Lambs, 14,480; Calves, 591; Pigs, 215.

MARK LANE.

MONDAY, Aug. 19.—The supply of English Wheat to this morning's market by land carriage samples was very small, consisting chiefly of new (about 800 qrs.); the quality was very variable, and the great bulk remained unsold towards the close of the market. A picked run or two were taken at 48s. per qr. for the white, and 44s. for the red; old could only be disposed of at a decline of 1s. to 2s. per qr. on the prices of this day se'nnight. In foreign the business was quite trivial, factors not being inclined to submit to a similar reduction.—Barley is a slow sale at our quotations.—The value of Beans and Peas is unaltered.—There is a moderate sale for Oats at last week's prices.—The quantity of new Mustard at market consisted of about 150 qrs.; the seed was generally small, condition very variable, and only a few of the finest samples could be sold.

FRIDAY, Aug. 23.—The supply of English corn this week has been very small, also from the Continent, excepting Wheat and Barley; of these the arrivals are good. The market this morning was very thinly attended, and in Wheat scarcely any business was transacted, and prices may be considered nominally the same as on Monday.—Fine Barley and Oats are inquired after, at fully late rates.—Beans and Peas maintain our quotations.—Rather higher prices are in some instances asked for Flour, but the trade is not brisk.—There is scarcely any inquiry for floating cargoes of Maize, the value of which remains nominally unaltered.

Imperial Averages.	Wheat.	Barley.	Oats.	Rye.	Beans.	Peas.

LIVERPOOL, Friday, Aug. 16.—The supplies of grain and flour are on a moderate scale this week. We have had only a slender attendance of buyers at this morning's market, and the business in any article was on a very moderate scale. Wheat was held with tolerable firmness, but in a few instances the turn of prices was in favour of the purchaser. Flour commanded full prices, and good and superior quality was not plentiful. Oats were ½d. per bushel cheaper. Beans were 6d. to 1s. per qr. higher. Barley and Peas without change. Indian Corn was 6d. to 1s. per qr. lower than on Tuesday. ——Tuesday, Aug. 20.—The arrivals of grain and flour this week have been very moderate, both from our own coasts and from abroad. Complaints are still made of Wheat and Potatoes being much worse than last year, but they have not exercised any influence on our prices, except checking any material decline. The business at our Corn Exchange this morning was on a very moderate scale. The best qualities of Wheat and Flour supported late rates, but in some instances 1d. to 2d. per bushel less money was taken for the middle quality of red Wheat, and 6d. per barrel on the lower grades of American Flour. Old and new Oats were ½d. per bushel cheaper. Beans were 6d. per qr. higher than last Tuesday. Barley and Peas without change in value, and in fair demand. Present prices: Wheat, English red, per 70 lbs., 5s. 10d. to 6s. 4d.; white, 6s 0d. to 6s. 7d. Barley, Scotch and Irish, per 60 lbs., 2s. 10d. to 3s. 1d. Malt, English, per qr. pale, 48s. to 52s. Oats, English and Scotch, per 45 lbs., 2s. 7d. to 2s. 9d. Beans, English, per qr., 28s. to 32s. Peas, do. do., 27s. to 30s.

MITCHELL'S MINERAL BLACK PAINT.—This antiseptic Paint is intended for Park Fencing, and for all farming purposes; it is particularly adapted, by its prevention of dry rot in timber and repellance of damp, for Barns, Stables, Outhouses, Weather Boarding, Hop-poles; also for Carts, Waggons, &c., particularly the Wheels, and for Iron Hurdles, Iron Railings, and all Wood or Iron Work in exposed situations. For Brick Walls it is highly serviceable as a preventive of damp, and also for Walls intended for Fruit Trees, as, besides preserving the Wall, it increases the heat in all situations exposed to the sun, and prevents the harbouring of insects. It is also an excellent covering for Canvas, or Cart Tilts, Roofing, &c. Sold in casks containing from 1 cwt. to any quantity, at 17*s.* 6*d.* per cwt., quite ready for use, by

JAMES PHILLIPS and Co. (he sole agents), 116, Bishopsgate-street, Without, London.

GLASS FOR CONSERVATORIES, HORTICULTURAL PURPOSES, &c.

T. MILLINGTON'S SHEET GLASS, which is of the best description, varying from 16 to 32 ounces, at from 2*d.* per foot and upwards; 100 feet and 200 feet cases of large Sheet Glass, for cutting up, at 2½*d.* per foot. British Plate Glass, from 1*s.* 2*d.* to 2*s.* per foot, according to size. Patent Rough Plate Glass, from ¼ to 1 inch in thickness, from 4*d.* per foot upwards. Glass Slates and Tiles. Milk Pans from 12 to 24 inches diameter, from 2*s.* to 5*s.* each Cucumber Tubes, from 12 to 24 inches long, at 1*d.* per inch. Lactometers, 7*s.* 6*d.* each. Wasp Traps.—Lists may be had, on application at the Warehouse, 87, Bishopsgate-street Without, same side as the Eastern Counties Railway.

HARTLEY'S PATENT ROUGH PLATE GLASS, JAMES PHILLIPS AND CO., 116, Bishopsgate-street Without, beg to hand their list of Prices of the above description of GLASS. Cut to order in panes of

8 by 6	and under	10 by 8	at 4½*d.*	per foot.
10 by 8	,,	14 by 10	at 5*d.*	,,
14 by 10	,,	1½ foot, or sizes not exceeding 20 inches long	at 5½*d.*	,,
1½ foot	,,	3 feet, or sizes not exceeding 30 inches long ...	at 6*d.*	,,

PACKED IN BOXES of 50 feet each.

6 by 4 and 6½ by 4½...10*s.* 6*d.* 8 by 6 and 8½ by 6½...13*s.* 6*d.*
7 by 5 and 7½ by 5½...12*s.* 0*d.* 9 by 7 and 10 by 8 ...15*s.* 0*d.*

We do not pledge ourselves to execute large orders for small squares at the above prices, but only as far as they turn up in cutting. Should any quantity of small squares be required, a special contract is necessary.

MILK PANS 2*s.* to 6*s.* each, Metal Hand-frames, Tiles, and Slates; Propagating and Bee Glasses from 2*d.* each; Cucumber Tubes, 1*d.* per inch; Peach Glasses, 10*d.* each; Wasp Traps, 3*s.* 6*d.* per dozen; Pastry Slabs, Hyacinth Glasses and Dishes Shades for Ornaments, Fish Globes, Plate and Window Glass of every description, and Lamp Shades. Lactometers for trying the quality of Milk, 4 tubes, 7*s.* 6*d*; 6 tubes, 10*s.* Self-registering Thermometers for Greenhouses, Horticultural Glass, &c.

From the *Gardeners' Chronicle*, December 8, 1849:

"As for the article substituted for Rough Plate, and which is actually in the market for the purpose of imposing upon gardeners, it is wholly unfit for any horticultural purpose. The best samples of it which we have yet seen is sold by Mr. JAMES PHILLIPS, 116, BISHOPSGATE STREET, LONDON."

GLASS FOR CONSERVATORIES, &c.

HETLEY AND Co. supply 16-oz. Sheet Glass of British Manufacture, at prices varying from 2*d.* to 3*d.* per square foot, for the usual sizes required, many thousand feet of which are kept ready packed for immediate delivery. Lists of Prices and estimates forwarded on application, for PATENT ROUGH PLATE, THICK CROWN GLASS, GLASS TILES and SLATES, WATER-PIPES, PROPAGATING GLASSES, GLASS MILK PANS, PATENT PLATE-GLASS, ORNAMENTAL WINDOW GLASS, and GLASS SHADES, to JAMES HETLEY and Co., 85, Soho-square, London.

See the *Gardeners' Chronicle* first Saturday in each month.

Height in front, 3 feet 6 in., wood and glass; 3 feet 6 in. brickwork.

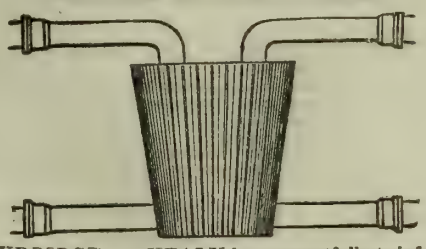
These Greenhouses are prepared in such a manner that any country carpenter can fix them with ease. A plan is sent free for the brickwork, &c.

Estimates for erecting and heating the above, on application. Lists of prices for Sash-doors, &c., post-free on application.

J. LEWIS, Horticultural Works, Stamford-hill, Middlesex.

TOOTHACHE PERMANENTLY CURED by using BRANDE'S ENAMEL for filling decaying Teeth, and rendering them sound and painless. Price 1*s.* Enough for several Teeth. The only substance approved by the medical faculty, as being unattended with pain or danger, and the good effects of which are permanent.

Sold by all Chemists in the United Kingdom. Twenty really authorised Testimonials accompany each box, with full directions for use. Sent free, by return for post, by J. WILLIS, 24, EAST TEMPLE CHAMBERS, WHITEFRIARS, FLEET-STREET, LONDON, in return for 13 penny stamps.

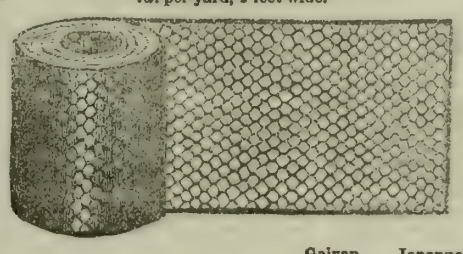


CAUTION.—The great success of this preparation has induced numerous unskilful persons to produce spurious imitations, and to Copy BRANDE'S ENAMEL Advertisements. It is needful, therefore, to guard against such impositions, by seeing that the name of JOHN WILLIS accompanies each packet.

ONE HUNDRED AND FIFTY Gallons per day of the Purest Water can be obtained with BIRD'S HYDROSTATIC SYPHON WATER PURIFIER, for purifying rain, river, tank, pond, or pump Water. This Scientific Instrument is only 4 inches in diameter, and 7 inches high; it is dropped into the vessel containing the water, and the pipe hung down outside, as indicated in the annexed drawing. It requires no fixing, and is set in action in two minutes.

Invented, made, and sold, by ALFRED BIRD, Experimental Chemist, Birmingham; and sold by all chemists and ironmongers in the kingdom; also sold wholesale and retail at Deane's, Ironmongers, London-bridge, London. Retail price 25*s.* each. Orders, containing a remittance, sent to any part of the kingdom. Packing-case 1*s.* extra.

REDUCTION IN PRICE OF BOILERS.



BURBIDGE AND HEALY beg respectfully to inform their Friends, in consequence of the present reduced price of iron, they are enabled to make a considerable reduction in the price of their Boilers. The price will be, now:

30 in.	do.	800 ft. 4 in. do.	... 15 15 0
36 in.	do.	1500 ft. 4 in. do.	... 25 0 0

All Boilers with double arms, up to 18 in., 5*s.* extra; to 24 in., 10*s.* extra; all above the same price.

130, Fleet-street, London, Aug. 24.

GALVANISED WIRE GAME NETTING.—7*d.* per yard, 2 feet wide.

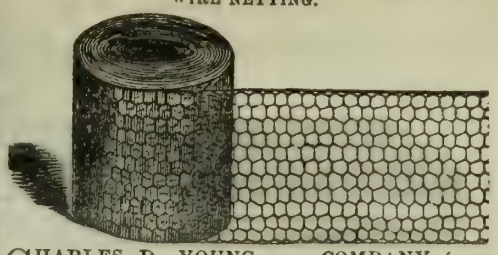
		Galvanised.	Japanned Iron.
2-inch mesh,	light, 24-inch wide ...	7*d.* per yd.	5*d.* per yd.
2-inch ,,	strong ,, ...	9 ,,	6½ ,,
2-inch ,,	extra strong ,, ...	12 ,,	9 ,,
1⅝-inch ,,	light ,, ...	8 ,,	6 ,,
1⅝-inch ,,	strong ,, ...	10 ,,	8 ,,
1⅝-inch ,,	extra strong ,, ...	14 ,,	11 ,,

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3*d.* per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

METCALFE AND Co.'s NEW PATTERN TOOTH-BRUSH and SMYRNA SPONGES.—The Tooth-Brush has the important advantage of searching thoroughly into the divisions of the teeth, and cleaning them in the most extraordinary manner, and is famous for the hairs not coming loose.—1*s.* An Improved Clothes-Brush, that cleans in a third part of the usual time, and incapable of injuring the finest nap. Penetrating Hair-Brushes, with the durable unbleached Russian bristles, which do not soften like common hair. Flesh-Brushes of improved, graduated, and powerful friction. Velvet-Brushes, which act in the most surprising and successful manner. The genuine Smyrna Sponge, with its preserved valuable properties of absorption, vitality, and durability, by means of direct importations, dispensing with all intermediate parties' profits and destructive bleaching, and securing the luxury of a genuine Smyrna Sponge. Only at METCALFE, BINGLEY, and Co.'s Sole Establishment, 130 B, Oxford-street, one door from Holles-street.

METCALFE'S ALKALINE TOOTH POWDER, 2*s.* per box.



CAUTION.—Beware of the words "From METCALFE'S," adopted by some houses.

ALLSOPP'S EAST INDIA PALE AND OTHER BURTON ALES.—In consequence of a very inferior article being now too frequently sold under the name of these favourite Ales, the public are respectfully requested to apply at the respective stores, where a list of bottlers will be furnished, from whom these ales may be obtained genuine, and where also they may be had in casks of 18 gallons and upwards, either singly or in any quantity. Apply to Messrs. SAMUEL ALLSOPP and SONS, The Brewery, Burton-on-Trent, or their Stores, at 61, King William-street, City; Cork-street, Liverpool; High-street, Birmingham; and the Exchange, Manchester.

THE HIPPOPOTAMUS presented by H. H. the Viceroy of Egypt to the Zoological Society of London, is exhibited daily from One to Six o'clock, at their Gardens in the Regent's Park. The Band of the First Life Guards will perform, by permission of Colonel Hall, every Saturday, at Four o'clock. Admission One Shilling, on Mondays Sixpence.

OLD FEATHER BEDS RE-DRESSED, AND PURIFIED BY STEAM WITH PATENT MACHINERY.—This new process of dressing not only removes all impurities, but by expanding the feathers the bulk is greatly increased, and consequently the bed rendered much fuller and softer.—Charge for dressing, 3*d.* per lb. Old and Mothy Mattresses effectually cured and removed, fetched and returned, carriage free, within five miles.—HEAL and SON'S List of Bedding, containing full particulars of weights, sizes, and prices, sent free by post on application to their factory, 196 (opposite the chapel,) Tottenham-court-road, London.

STRONG PREMIUM HARE AND RABBIT PROOF WIRE NETTING.

CHARLES D. YOUNG AND COMPANY (LATE W. AND C. YOUNG),

MANUFACTURERS OF IRON AND WIRE WORK, &c.,
22, PARLIAMENT STREET, WESTMINSTER, LONDON;
48, NORTH BRIDGE, EDINBURGH;
32, ST. ENOCH SQUARE, GLASGOW;
1, CASTLE BUILDINGS, DERBY SQUARE, LIVERPOOL;

beg respectfully to call the attention of Landed Proprietors and others to their strong Wire-Net Fence, for excluding Hares and Rabbits from Gardens, young Plantations, Nurseries, &c.

This Net was exhibited at the Show of the Highland and Agricultural Society of Scotland, held lately at Inverness, where its Efficiency, Great Strength, and Exceeding Cheapness attracted general attention, and had awarded from the Judges the Society's Silver Medals, with high commendations.

The immense damage done by Hares and Rabbits in Gardens and Young Plantations is often so great, that in the course of a year or two it will amount to more than the entire cost of protecting them with this Net. It is so durable, that when Plantations are sufficiently advanced to be independent of its protection, it can be removed to other exposed situations with the greatest facility, by any labourer. As a Fence against Hares and Rabbits, it is of itself quite sufficient, having only to be unrolled and attached, with small wire sent for that purpose, to wooden stakes driven into the ground, about every six or seven feet apart. It is, besides, peculiarly adapted for rendering Hedges, Paling, or other existing Fences, *completely impervious* to such vermin; and by being cut up into small pieces of three or more feet, as required, it forms a most efficient guard, at little expense, for individual Plants and Shrubs.

PRICES.—18 ins. high, 9*d.*; 24 ins., 1*s.*; 30 ins., 1*s.* 3*d.*; and 36 ins., 1*s.* 6*d.* per lineal yard.

Or a web of 100 yards, 18 ins. wide, will cost	..	£3 15 0
Do. of 100 yards, 24 ins. wide	.. ..	5 0 0
Do. of 100 yards, 30 ins. wide	.. ..	6 5 0
Do. of 100 yards, 36 ins. wide	.. ..	7 10 0

If more or less than a web is required, it would be charged at the same rate per yard.

This Netting is also admirably adapted for Pheasantries and Poultry-yards, and is charged at the same rate. As carriage has, in many instances, been an obstacle to parties at a distance requiring this Net, C. D. Y. and Co. have made arrangements by which they will undertake to deliver it at any of the principal ports of Scotland, England, and Ireland, for One Halfpenny per lineal yard.

C. D. YOUNG and Co. cannot give a better idea of the great strength of their Premium Wire Netting than by stating that the weight of one yard of their 24-inch at 1*s.* is equal to 2½ yards of another article in the market, the same width, at 9*d.* per yard. Samples for inspection sent free of expense.

C. D. YOUNG & Co. manufacture every description of IRON and WIRE WORK required for this and foreign countries.

Workmen sent to all parts of Scotland, England, and Ireland.

TO AMATEUR FLORISTS, AND OTHERS.

TO BE LET, A Compact Villa Residence, situated close to the Ealing Station, on the Great Western Railway, having front and back Flower Gardens, with span-roofed Greenhouse, 19 feet by 14 feet, with hot-water apparatus, pits, &c., suitable for a gentleman, or for a florist requiring premises on a small scale. The present proprietor removing, will treat liberally for the disposal of the furniture of the house, the garden plants, and stock.—For particulars, apply at Mr. DEEK'S Auction and Estate Agency Offices, 26, Albion-street, Hyde-park square, London.

IMPORTANT INFORMATION.

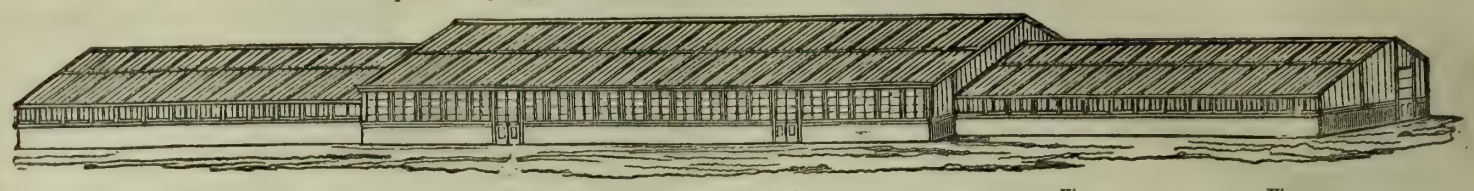
DR. ROBERTS'S celebrated OINTMENT called the POOR MAN'S FRIEND, is confidently recommended to the Public as an unfailing remedy for wounds of every description, a certain cure for ulcerated sore legs (if of 20 years' standing), cuts, burns, scalds, bruises, chilblains, scorbutic eruptions and pimples in the face, sore and inflamed eyes, sore heads, sore breasts, piles, fistula, and cancerous humours, and is a specific for those afflicting eruptions that sometimes follow vaccination. Sold in pots at 1*s.* 1½*d.* and 2*s.* 9*d.* each. Also his PILULÆ ANTI-SCROPHULÆ; confirmed, by more than 40 years' experience, to be without exception one of the best alterative medicines ever compounded for purifying the blood and assisting Nature in all her operations: hence they are useful in scrofula, scorbutic complaints, glandular swellings (particularly those of the neck, &c.) They form a mild and superior family aperient, that may be taken at all times without confinement or change of diet. Sold in boxes at 1*s.* 1½*d.*, 2*s.* 9*d.*, 4*s.* 6*d.*, 11*s.*, and 22*s.* each.—Sold wholesale by the proprietors, BEACH and BARNICOTT, at their Dispensary, Bridport, and by the London Houses; and retail, by all respectable Medicine Vendors in the United Kingdom.

A CLEAR COMPLEXION.

GODFREY'S EXTRACT OF ELDER FLOWERS is strongly recommended for Softening, Improving, Beautifying, and Preserving the SKIN, and in giving it a blooming and charming appearance, being at once a most fragrant perfume and delightful cosmetic. It will completely remove Tan, Sun-burn, Redness, &c., and by its balsamic and healing qualities, render the skin soft, pliable, and free from dryness, scurf, &c., clear it from every humour, pimple, or eruption; and, by continuing its use only a short time, the skin will become and continue soft and smooth, and the complexion perfectly clear and beautiful. Sold in bottles, price 2*s.* 9*d.*, with directions for using it, by all Medicine Vendors and Perfumers.

THE BLOOD.—Our bodies have been entirely formed, *are now forming, and will continue to be built up during life from the blood. What the sap is to the tree the blood is to the animal frame; and inasmuch as the strength and verdure of a tree are dependant on the moisture derived from the root, the health and vigour of the body are indispensably connected with a pure and free circulation of this important fluid. It is this that must feed the flame of existence; and unless its replenishments are freely and purely communicated, the vital fire becomes clouded, burns dimly, and is ultimately extinguished. The grand object is to keep this precious fluid (the blood) in a pure and healthy state, for without this purity, disease will show itself in some way or other.*

PARR'S LIFE PILLS.



It is universally admitted that this medicine will purify the blood better than any other, and will conquer any disease.

None are genuine unless the words "PARR'S LIFE PILLS" are in WHITE LETTERS on a RED GROUND, on the Government stamp, pasted round each box; also the fac-simile of the signature of the Proprietors, "T. ROBERTS and Co., Crane-court, Fleet-street, London," on the directions.—Sold in boxes at 1*s.* 1½*d.*, 2*s.* 9*d.*, and family packets at 11*s.* each, by all respectable medicine vendors throughout the world.

GRAY, ORMSON, AND BROWN,

DANVERS STREET, CHELSEA,

Respectfully solicit the attention of the Nobility and Gentry to their superior manner of Erecting and Heating every description of Building connected with Horticulture. They have much pleasure in giving the following testimonial referring to the range of houses shown below.

Peach House, 30 by 16 feet. | Vinery, 30 by 16 feet. | Stove, 45 by 20 ft. | Greenhouse, 45 by 20 ft. | Vinery, 30 by 16 ft. | Vinery, 30 by 16 ft.

[Erected for John Shaw Leigh, Esq., Luton Hoo.]

Extract of a Letter from Mr. Fraser.—"I have much pleasure in expressing my entire satisfaction with the range of houses you erected here. I may also state that my honoured employer, John Shaw Leigh, Esq., is perfectly satisfied. I have no hesitation in stating, that to the best of my knowledge, there is not a more complete range of glass in the country, as regards both building and heating. I may add that they are admired by every Gardener who has seen them. I shall have much pleasure in answering any references you may please to direct.

(Signed.) "James Fraser, Gardener, Luton Hoo Park."

DALSTON NURSERY.

GREAT SALE OF GREENHOUSES, PITS, &c.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, BUILDERS, AND OTHERS.

MESSRS. PROTHEROE and MORRIS are instructed, by Mr. J. Smith, to submit to pubic competition by Auction, on the premises, Dalston Nursery, Middlesex, on MONDAY, September 2, at 12 o'clock (in consequence of the premises being required by the London and Birmingham West India Dock Junction Railway Company), the erection of 14 Greenhouses, several Pits, and one, two, and three-light Boxes, the greater portion of which are glazed with green glass; also a considerable quantity of Bricks, Paving Stones, Hot-water Pipe, Furnaces, &c. May be viewed prior to the sale. Catalogues may be had of the principal Seedsmen in London, on the Premises, and of the Auctioneers, American Nursery, Leytonstone, Essex.

N.B. The whole of the choice Greenhouse Plants (including the Camellias, ranging from 18 inches to 10 feet, beautifully set with bloom buds) will be sold by Auction the latter part of September.

BRENTFORD.

TO NOBLEMEN, GENTLEMEN, NURSERYMEN, MARKET-GARDENERS, AND PUBLIC COMPANIES, ENGAGED IN PLANTING.

MESSRS. PROTHEROE and MORRIS are favoured with instructions to submit to an unreserved Sale, by Auction, on the premises, Brentford Nursery, Middlesex, about the second week in October (by order of the executors of the late Mr. J. Ronalds), the whole of the valuable NURSERY STOCK, riding over about 30 acres, consisting of a large and rich assortment of Standard and Dwarf Maiden, Trained and Untrained Fruit trees, of every description; Ornamental trees, Deciduous and American Shrubs; fine Evergreens, &c. Further particulars in future advertisements.

American Nursery, Leytonstone, Aug 1850.

THE SURPLUS STOCK OF MESSRS. VAUGHAN AND CO.'S ARTIFICIAL STONE WORKS, preparatory to the Removal of the Firm to more extensive premises.

TO THE NOBILITY, GENTRY, ARCHITECTS, BUILDERS, FLORISTS, AND OTHERS.

MR. F. W. GODDARD (late with Messrs. Musgrove and Gadsden) has been favoured with instructions to sell by Auction, on the premises, 60, Stones'-end, Borough, on TUESDAY, August 27, at 11 o'clock, the SURPLUS STOCK of the above eminent manufacturers, whose productions enjoy an universal reputation for durability, elegance of design, and exquisite finish. It comprises finely modelled Statues after the ancient and modern masters, including Bacchus, Ceres, Hebe, Piping Faun, Baily's Eve at the Fountain Flora and Paris, Children after Chantrey, Faith, Hope, and Charity, the Seasons, the Elements, &c.; a pair of matchless Sea-horses, a life-size Stag, several pairs of Lions, Sphinxes, Dogs after Landseer, Eagles, and Storks; superb Fountains in every variety of style, pattern, and dimension, choice collection of Vases, Tazzas, and Garden Ornaments, Sepulchral Urns, Coats of Arms, Gothic Panels and Tracery, Caps, Trusses, and other Architectural Decorations, Balustrades, Sinks, Kerbs, two 12 feet Scagliola Columns with Ionic Capitals, and numerous other items.—To be viewed the day previously and morning of sale. Catalogues may be had on the premises, and at Mr. F. W. Goddard's Auction and Estate Agency Offices, 2, Moorgate-street, near the Bank, London.

FARMS TO BE LET AT MICHAELMAS NEXT.

MR. HURLEY, Auctioneer and Farm Agent, begs to urge Farmers and others requiring either large or small Farms, to make known their wants to him without delay, as he has upwards of Fifty Farms, both arable and meadow, of the first description, from 60 to 600 acres, adapted to every kind of Farming, and rents to meet the times, with good houses and outbuildings in the counties of Cambridge, Surrey, Berks, Bucks, Essex, Kent, and Middlesex Applications, accompanied by two stamps, will receive instant attention.—Direct to the Agricultural Agency Offices, 62, Nelson-square, Blackfriars-road, London.

SURREY, KENT, AND SUSSEX.

FARMS TO LET, FROM MICHAELMAS NEXT.

MR. HURLEY has TO LET the following, among other FARMS:—No. 1, a capital Farm, in Surrey, of 400 acres. No. 2, a capital Farm, same county, of 170 acres. No. 3, a capital Farm, tithe free, same county, of 600 acres. No. 4, a capital Farm, in Kent, of 220 acres. Also others, averaging from 60 to 300 acres, same counties, and in Middlesex. Rents low, to meet the times. The whole have good Houses and Outbuildings.—Applications (inclosing two stamps) addressed to the Land and Estate Offices, 62, Nelson-square, Blackfriars-road, London.

MOST DESIRABLE DAIRY AND GRAZING ESTATE, in the Tything of Pennycross, in Devon, within about Two Miles of the large and populous towns of Plymouth, Devonport, and Stonehouse.

TO BE LET BY TENDER, for a term of Fifteen Years, from Lady-day, 1851, all that the Barton of Pennycross, in the Tything of Pennycross, as the same is now occupied by Mr. Thomas Rowe, containing altogether about 240A. 3R. 0P (more or less). This ESTATE consists of prime Grazing and Dairy Land, and Orchards; and, from its near contiguity to the above towns (where dressing of the best description and in any quantities can be procured, and between which and the estates there is no turnpike-gate), such an opportunity is presented to a spirited Grazier and Agriculturist, who can command a capital of not less than 3000l., as is seldom offered to that class of persons. The Tithe-rent charges and the Parochial rates are extremely moderate.

The conditions on which the Estate will be Let may be seen at the Office of the under-mentioned, to whom tenders must be sent before the 1st day of September next; immediately after which time the person whose tender is accepted will be informed thereof. Mr. Rowe, the present tenant, will show the Estate, on application; or it may be seen by applying at Mannadon House, in Pennycross, aforesaid; and all other information can be obtained from Messrs. Little and Woollcombe, Solicitors, Ker-street, Devonport.—Devonport, Aug 24.

VALUABLE NURSERY AND SEED TRADE FOR SALE.—The Business referred to has been established nearly 60 years, at an important Midland County Town. It possesses a good and extensive connection. The Nursery is of moderate extent, and well stocked. The Shop is situated in the Market Place, and most eligible. An applicant of moderate capital, with the requisite knowledge and energy, will be liberally treated with, and a Lease granted.—The Proprietor's address can be had at the Office of this Paper.

BRITANNIA LIFE ASSURANCE COMPANY,

1, PRINCES-STREET, BANK, LONDON.

Empowered by Special Act of Parliament, 4th Vic., cap. 9.

Directors.

William Bardgett, Esq. | Robert Eglinton, Esq.
Wm. Fechney Black, Esq. | Erasmus R. Foster, Esq.
George Cohen, Esq. | Peter Morrison, Esq.
Millis Coventry, Esq. | Henry Lewis Smale, Esq.
John Drewett, Esq.

Auditors.

J. B. Bevington, Esq.; F. P. Cockerill, Esq.; J. D. Dow, Esq.

Medical Officers.

D. W. Cohen, M.D., 6, Cleveland-row.
John Hutchinson, M.D., 105, Milton-street, Dorset-square.
F. Le Gros Clark, Esq., Surgeon, 24, Spring-gardens.

Standing Counsel.

The Hon. John Ashley, New-square, Lincoln's-inn.
Mr. Sergeant Murphy, M.P., Temple.

Solicitor.—William Bevan, Esq., Old Jewry.

Bankers.—Messrs. Drewett and Fowler, Princes-street, Bank.

Among others, the following important advantages may be enumerated.

HALF CREDIT RATES OF PREMIUM.

Persons assured according to these rates are allowed credit (without security) for half the amount of the first seven annual premiums, paying interest thereon at the rate of 5 per cent. per annum, with the option of paying off the principal at any time, or having the amount deducted from the sum assured when the Policy becomes a claim.

Policies may thus be effected at lower rates than are generally required for the term of seven years only; whilst the holders have the same security for the payment of their claims, whenever death may happen, as if they paid double the amount of premium, which would be charged for insurances effected in the usual way.

Increasing Rates of Premium on a new and remarkable plan for securing Loans or Debts; a less immediate payment being required on the Policy for the whole term of life than in any other office.

Policies revived without the exaction of a fine, at any time within twelve months.

A Board of Directors in attendance daily at Two o'clock.

Age of the Assured admitted in the Policy.

Medical attendants remunerated in all cases for their reports.

Extract from the Half Credit Rates of Premium:

Annual Premium required for an Assurance of £100 for the whole term of Life.

Age.	Half Premium for seven years.	Whole Premium after seven years.

Peter Morrison, Resident Director.

THE YORKSHIRE FIRE AND LIFE INSURANCE COMPANY.

Established at York, 1824. Empowered by Act of Parliament.

Capital 500,000l.

Trustees—Lord Wenlock, Escrick Park.
G. L. Thompson, Esq., Sheriff-Hutton Park.
Robt. Swann, Esq., York.

Bankers—Messrs. Swann, Clough, and Co., York.

Actuary and Secretary—Mr. W. L. Newman, York.

The attention of the public is particularly called to the terms of this Company for LIFE INSURANCES, and to the distinction which is made between MALE and FEMALE Lives.

Extract from the Table of Premiums for Insuring 100l.

Age next birthday.	Whole Life Premiums. A Male.	A Female.	Age next birthday.	Whole Life Premiums. A Male.	A Female.
10	£1 7 6	£1 5 4	46	£3 11 6	£3 3 2

And Illustrated by highly finished Plates and Woodcuts.

London: Bradbury and Evans 11 Bouverie-street.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.

WARRANTED BEST MATERIALS AND WORKMANSHIP AT THE LOWEST POSSIBLE PRICES.

J. WEEKS and CO., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. Weeks and Co., King's-road, Chelsea London.

BAKER'S PHEASANTRY, Beaufort-street, King's-road, Chelsea, by special appointment to her Majesty and H. R. H. Prince Albert.—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shovellers, gold-eyed and dun divers, Carolina ducks, &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied, and common pea-fowl, and pure China pigs; and at 3, Half-moon-passage, Gracechurch-street, London.

THE TEETH.—How often do we find the human face divine disfigured by neglecting the chiefest of its ornaments, and the breath made disagreeable to companions by non-attention to the Teeth! Though perfect in their structure and composition, to keep them in a pure and healthy state requires some little trouble; and if those who are blessed with well-formed Teeth knew how soon decay steals into the mouth, making unsightly what otherwise are delightful to admire, and designated unhealthiness by the impurity of the breath, they would spare no expense to chase away these fatal blemishes. But although most ladies are careful, and even particular in these delicate matters, yet few are sufficiently aware of the imperative necessity of avoiding all noxious or mineral substances of an acrid nature, and of which the greater part of the cheap Tooth Powders of the present day are composed. It is highly satisfactory to point out Messrs. Rowlands' Odonto, or Pearl Dentrifice, as a preparation free from all injurious elements, and eminently calculated to embellish and preserve the dental structure, to impart a grateful fragrance to the breath, and to embellish and perpetuate the graces of the mouth.—*Ladies' Gazette of Fashion.*

ROWLAND'S ODONTO

Is a white powder compounded of the choicest and most *recherché* ingredients of the oriental herbal, of inestimable value in preserving and beautifying the Teeth, strengthening the Gums, and in rendering the breath sweet and pure. Price 2s. 9d. per box.—Sold by A. Rowland and Sons, 20, Hatton-garden, London, and by Chemists and Perfumers.

THE CURATIVE PROPERTIES OF HOLLOWAY'S OINTMENT AND PILLS ARE DAILY ATTESTED.—All ranks of society and medical men, both at home and abroad, speak of these incomparable medicines in the most flattering terms, and assert that in the severest cases of Chronic Ulcers, those even which were considered incurable, Holloway's Ointment has been truly efficacious when used, and there is no disputing the fact that Holloway's Pills are the very best family medicine ever known or tried. These admirable remedies will cure Rheumatic Affections, Glandular Swellings, Bad Legs, however inveterately diseased; likewise the most obstinate cases of Scurvy, Ringworm, Scrofula, or King's Evil.—Sold by all Vendors of Medicine, and at Professor Holloway's Establishment, 244, Strand, London.

Printed by William Bradbury, of No. 13, Upper Woburn-place, in the Parish of St. Pancras, and Frederick Mullett Evans, of No. 7, Church-row, Stoke Newington, both in the County of Middlesex, Printers, at their office in Lombard-street, in the Precinct of Whitefriars, in the City of London; and published by them at the Office, No. 5, Charles-street, in the parish of St. Paul's, Covent-garden, in the said county, where all Advertisements and Communications are to be addressed to the Editor.—Saturday, August 24, 1850.

GRAND DAHLIA, HOLLYHOCK, AND MISCELLANEOUS FLOWER SHOW.

ROYAL SOUTH LONDON FLORICULTURAL SOCIETY. Under the Patronage of

HER MOST GRACIOUS MAJESTY, THE QUEEN.

THE FIFTH AND LAST EXHIBITION for this season will be held at the ROYAL SURREY ZOOLOGICAL GARDENS, on Wednesday, the 4th of September, 1850 (Open to all Exhibitors), when Prizes will be awarded for the following productions, viz. Miscellaneous and Specimen Plants, Dahlias, Hollyhocks, Verbenas, Antirrhinums, Cut Flowers, and Fruit. In addition to the Prizes offered by the Society, 2*l*. 10*s*. will be given for the best stand of 3 blooms of Seedling Dahlias in 1, 2, or 3 varieties (not sent out) of the exhibitor's own raising, and 2*l*. 10*s*. for Fancy Dahlias, ditto. Lists of Prizes and the Rules for exhibiting may be obtained from John T. Neville, Secretary, Ebenezer House, Peckham, Surrey.

GRAND TRIAL SHOW OF SEEDLING DAHLIAS, &c.—On THURSDAY, Sept. 19, the Annual Metropolitan Show of DAHLIAS will be held at the Gardens of the Grecian Saloon, on the same grand scale as it was conducted in 1847, when Established Flowers will be shown in five classes; New Flowers set out in May in two, and seedlings in two; in all, nine classes. There will also be two classes extra; one for new Verbenas, Fuchsias, Antirrhinums, Petunias, Phloxes, Pansies, and all other kinds of Flowers, Plants, Fruits, or Vegetables; and one for Implements, Tools, Apparatus, and various materials used in or appertaining to Gardens and Horticultural Establishments. The full schedule will appear in the Country Gentleman Weekly Garden Newspaper of September 2 9, and 16.

*** This will be by far the best Show of the season.

420, Strand, August 31.

WATERER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, &c.

HOSEA WATERER begs to announce his new descriptive CATALOGUE OF AMERICAN PLANTS, CONIFERS, ROSES, &c., is just published, and may be had by enclosing two stamps for postage to Hosea Waterer, Knap Hill Nursery, Woking, Surrey.

☞ Everybody who has any idea of planting the ensuing autumn should possess themselves of this Catalogue.

NEW SEED OF TRIFOLIUM INCARNATUM, DICKINSON'S IMPROVED ITALIAN RYE-GRASS, NATURAL GRASSES FOR PERMANENT PASTURE, AND WINTER VETCHES.

JOHN SUTTON and SONS have just harvested the above valuable articles for present sowing, and will send them carriage free at very low prices.

Prices and other particulars may be had by post on application to John Sutton and Sons, Reading, Berks.

TILEY'S VIOLA ARBOREA, OR PERPETUAL TREE VIOLET.—Viola Arborea, or the Perpetual Tree Violet (true).—In answer to numerous inquiries for the above, and great satisfaction given by the plants sent out last season by Edward Tiley, he begs to state that he has this year a fine stock of the above beautiful DOUBLE VIOLET now to dispose of, which he can highly recommend, this being the proper time for making beds or potting. They are beautifully scented; the blooms are as large as the double blue Hepatica; they bloom freely from August till the end of May, and are perfectly hardy. Twelve of these plants grown in pots will scent a large greenhouse, and a small bed, 9 feet long by 3 feet wide, will be sufficient to furnish a family with bouquets the whole of the winter and the spring. They should be planted in rather a dry situation and a loose soil, as the Violet will thrive and bloom finer than in wet or clay borders.

E. T. has been informed by the gentleman that introduced it into this country, that he has seen them growing in the thickets of Persia to the height of 4 feet, with large bushy heads to them, and hundreds of blooms on them at the same time. Large bushy plants, 6*s*. per dozen; smaller ditto, 3*s*. per dozen; or 2*l*. per hundred.

Also he has a fine stock of that splendid YELLOW VIOLET, or VIOLA LUTEA, which has been so much admired at the London exhibitions. In colour it is equal to the Crocus. Strong bushy plants 2*s* 6*d*. each; or smaller ditto, 1*s* 6*d* each.

KITLEY'S GOLIAH STRAWBERRY.—Strong well rooted plants at 3*s*. per dozen.

True BATH COS LETTUCE SEED, 1*s*. per packet.

Extra fine SWEET-WILLIAM SEED, saved from 24 distinct varieties, 1*s*. per packet.

ANTIRRHINUM SEED from all the best varieties, 1*s*. per packet.

WINTER CUCUMBER.—Lord Kenyon's Favourite, 2*s*. 6*d*. per packet

The whole or any quantity of the above will be sent, postage and package free, to any part, on receipt of a Post-office order, or the amount in penny postage stamps.

Sold by Edward Tiley, Nurseryman, Seedsman, and Florist, 16, Pulteney-bridge, Bath.

HUGH LOW and CO. have just published their GENERAL CATALOGUE OF PLANTS, which can be had free on application.—Clapton Nursery, London, Aug. 31.

DANIEL BUTLER has purchased the Stock of SEEDLING CINERARIAS of Mr. J. Pond (a successful Amateur), of Devonshire Cottage, Bath, saved from the best sorts in cultivation with great care; all Show Flowers, viz., Madame Cerito, Sir Charles Napier, Bridesmaid, Lilac Perfection, Climax, Blue Beard, Dazel, Rosea, Fairy, Lord Gough, Queen of May, and Beauty of Newington. The plants will be all had from Devonshire Cottage by D. B. as they are sent out, all true from the sorts named above. This will present an opportunity of possessing a first-rate collection at a very low price, viz., 4*s*. per doz. A deduction where a large quantity is taken.

N.B. A remittance expected from unknown correspondents.

Widcombe Nursery, Bath, Aug 31.

MESSRS. J. and H. BROWN have to offer some fine large Double Camellias, Orange Trees, Scarlet Rhododendrons, Azaleas, and other large Ornamental Plants, suitable for any nobleman or gentleman about to furnish a new Conservatory. May be seen at the Nursery, or size and prices sent by post.

Address John Sutton and Sons, Reading, Berks.

TO THE ADMIRERS OF THAT SPLENDID AUTUMNAL FLOWER, THE CHRYSANTHEMUM.

YOUELL and Co. are now prepared to execute orders from their extensive and very select collection of the above, comprising all the new and fine continental varieties, at the following prices:

50	best new sorts	25*s*.
25	ditto	15*s*.
12	ditto	9*s*.

Well established in small pots, or by post free.

NEW DWARF CHINESE OR LILLIPUTIENNE CHRYSANTHEMUMS.

This new and beautiful class are well deserving the attention of cultivators from their exceeding dwarf habit (not attaining more than 1 foot in height). The profusion of flowers with which they are covered, as well as the great variety and distinctness of colour, will render them general favourites. Strong plants for autumn blooming are now ready for sending out at the following prices:

9	fine varieties sent out last year (for the first time) for	9*s*. 0*d*.
13	do. raised by M. Lebois (and sent out for the first time this season), for	30 0

One sent over to the Trade when two are ordered.

The latter are figured in the last December Number of the "Annales de la Societé d'Agriculture et de Botanique de Gand," and are perfect gems, engravings of which may be seen at Youell and Co.'s Nursery.

Descriptive Catalogues of the above may be had on application. Printed directions of their successful and easy method of cultivating the Chrysanthemums for exhibition, &c., will be forwarded with all orders.

ANEMONE SEED,

Saved from selected sorts, is now being harvested by Youell and Co. in the finest condition, and can be forwarded, per post free, at 2*s*. 6*d*. and 5*s*. per packet, sufficient to sow a bed of 12 and 24 yards. If sown at the present time it will afford a fine display through the autumn and winter months.

Royal Nursery, Great Yarmouth.

IXORA SALICIFOLIA (true), WILLOW-LEAF IXORA.

MESSRS. VEITCH and SON are now prepared to send out strong plants of the above beautiful and distinct IXORA, received by them from Java through Mr. Thos. Lobb. It is a lovely free-blooming species, flowering in a very young state, and at the Chiswick Exhibition in July last received the first prize for new and rare plants—the Silver Gilt Medal. It is figured and described in Curtis's "Botanical Magazine" for July last.

Strong well established plants 21*s*. each; one over to the Trade on three.—Exeter, Aug 31.

NURSERIES, CLAPHAM, NEAR LONDON.

FINE LATE STRAWBERRY, "LA DELICIEUSE."

J. & J. FAIRBAIRN have much pleasure in announcing that they will be prepared to send out the above early in September.

J. and J. F. can with confidence recommend this STRAWBERRY, as one possessing first-rate excellence. Its distinguishing characters are—the plant, of hardy habit and great productiveness of bearing; fruit, rather above medium size and of exquisitely rich flavour; colour, amber, like a Bigarreau Cherry; season of ripening late, after most other Strawberries are over; fruit firm, remaining good longer after ripe than other varieties, thus lengthening the Strawberry season by a considerable period. From its many excellences, it will be found an acquisition in any establishment. Price, 60*s*. per 100; or 12*s*. per dozen. N.B. A remittance with order respectfully requested from unknown correspondents. Orders addressed to J. and J. Fairbairn, Nurseries, Clapham, near London; or to the following Agents, will have prompt attention.

Austin and M'Aslin, Glasgow	Harrison, John, Darlington
Bunyard, T., Maidstone	Harrison, T., Hindon, Wilts
Backhouse, J., and Son, York	Imrie and Sons, Ayr
Burgess & Kent, Penkhull	Little & Ballantyne, Carlisle

Dickson & Co., Edinburgh	Mackie, Arthur, Norwich
Dickson, F. and J., Chester	Mills, Edwin, Shaftesbury
Dickson and Turnbull, Perth	Macintyre, Jas., Taunton
Dixon, E. P., Hull	Pontey, Alex., Plymouth
Drummond and Sons, Stirling	Scott, J., Bathford, near Bath
Darby, R. F., Cirencester	Tait, Henry, Kelso
Fisher and Holmes, Sheffield	Veitch and Son, Exeter
Frettingham, Geo., Beeston, near Nottingham	Watkinson, T. P., Manchester
Garraway, Mayes, & Co., Bristol	Widnall and Davis, Cambridge
	Wheeler, J. C. & Co., Gloucester.

KITLEY'S GOLIAH STRAWBERRY. — The merits of this Strawberry are now so well known, as being hardy, large, fine in colour, a most excellent flavour, and forces well, that all parties who have seen it growing, or tasted the fruit, have expressed their entire satisfaction with it. This is the fifth season it has fruited in the same bed, and the plants are now perfectly healthy, and likely to continue much longer in bearing; the fruit this season have been as large and more abundant than from younger plants.

From the *Gardeners' Chronicle*—"Strawberries: *J. K.* Your Seedling Strawberry, Goliah, judging from its size and appearance, is worthy of cultivation."

From the *Gardeners' and Farmer's Journal*.—"Strawberries. *J. K., Lyncombe Vale*.—We have great pleasure in bearing testimony to the exquisite flavour of your Seedling Strawberry, 'Goliah.' In our opinion, it combines the piquant flavour of the Strawberry with the richness of the Pine, the delicious aroma of which it partakes in equal proportion to taste. Apart from the Queen of Fruits, we certainly do not remember anything in this way that conveyed to our senses so delicious a treat as the noble fruit to be known to the world as 'Kitley's Goliah Strawberry.'"

Strong well-rooted plants are now ready at 3*s*. 6*d*. per dozen, or 1*l*. per 100, on prepaid application only to James Kitley, Bath; Messrs. Low and Co., Clapton Nursery; Mr J. G Waite, Seedsman, 181, High Holborn, London; Messrs. Garraway, Mayes, and Co., Bristol; Messrs. Lucombe, Pince, and Co. Exeter; and Messrs. W. E Rendle and Co., Plymouth.

Lyncombe Vale Nursery, Bath, Aug. 31.

TO ORNAMENTAL PLANTERS.

WHITLEY AND OSBORN respectfully beg to call attention to their PRICED CATALOGUE OF HARDY TREES AND SHRUBS for the ensuing season, which may be had on application to them at their Nursery, Fulham, near London.

N.B. If collections or large selections are taken, a deduction from the prices affixed would be made, and also when a large number of a sort are taken.

GENUINE SEEDS FOR SEPTEMBER SOWING,
All free by post.

12 packets of Hardy Annuals, 1s. 6d.; 24 do., 2s. 6d.; 12 do. Biennials, 2s.
1 strong plant or bulb of Heracleum giganteum, for flowering next summer, 1s.; 6 do., 4s. 6d.; 1 packet of new seed, 6d
1 packet of Cinerarias, fine mixed, 1s.; Hollyhocks, do., 6d.; Pentstemons, do., 6d.; Sweet-Williams, do., 6d.; Stocks, do., 6d. Seeds per oz.—Nemophila insignis, 8d.; do., 4 vars. mixed, 8d.

VEGETABLE SEEDS.—Lettuces, Normandy Cress, Lamb Lettuce, &c., 8d.: Cauliflower, per packet, 6d.—Remittances requested.

ABRAHAM HARDY and SON, Seed-growers, Maldon, Essex.

ROSES.

EDWARD DENYER, NURSERYMAN, Loughborough-road, Brixton, near London, begs to inform Noblemen, Gentlemen, &c., that his superb collection of Autumnal Roses is now in full bloom. E. D likewise invites an inspection of his unrivalled collection of Fruit Trees and Evergreen Shrubs, in quantities, of the finest growth. Orders taken for them at this time, and delivered in November next.

E. D. informs his friends that he has no seed shop in London.

WILMOT'S "PRINCE ARTHUR" STRAWBERRY.

J. WILMOT begs to state that he will commence sending out his new Strawberry next week. Orders forwarded to himself or the following agents will be duly executed. Price 5l. per 100.

AGENTS.—Robert Glendinning, Chiswick Nursery; William T. Atwood, Mortlake, Surrey; George Cranwood, Seedsman, Covent-garden; and Messrs. Hurst and M'Mullen, 6, Leadenhall-street.—Isleworth, Middlesex, Aug. 31.

SPLENDID DOUBLE RANUNCULUSES.

MR. SNELLING is prepared to send out a few hundred Roots of the above most beautiful Flower (the same Stock he sent out last March which gave such general satisfaction), at the low price of 5s. per 100, well worth 20s. Carriage free, 6s. per 100.—5, King's-road, Brighton.

"BRITANNIA" STRAWBERRY.

JAMES JACKSON, in offering his new seedling Strawberry BRITANNIA to the public, can with confidence recommend it to Gentlemen and Market Gardeners, as being a Strawberry that cannot fail to give general satisfaction, as it has a combination of excellent qualities not to be met with in any other at present in cultivation, being a very strong grower and an abundan bearer. It is as late as the Elton Pine, and much larger. It ripens well in any situation, and is of excellent flavour, and of a deep scarlet colour. It grows a large size, and has generally six or eight fruit on one stem. Strong plants of this superb Strawberry will be ready in September at 4l. per 100.—Application to be made to JAMES JACKSON, Gardener, Marfleet-lane, Hull; Mr. M'INTOSH, Seedsman, &c., Hull; Mr. DANIELS, Hessle-road Nursery, near Hull; or to Mr. HAIRS, Seedsman, 109, St. Martin's-lane, London. As the stock is limited, early prepaid orders will be promptly attended to. The usual allowance to the Trade.

EXHIBITION OF LILIUM LANCIFOLIUM, OR THE BEAUTIFUL JAPANESE LILY.

HENRY GROOM, CLAPHAM RISE, near LONDON, by Appointment FLORIST TO HER MAJESTY THE QUEEN, and to HIS MAJESTY THE KING OF SAXONY, begs to invite the Nobility, Gentry, and Public, to inspect his unrivalled collection of this most SPLENDID HARDY LILY, which is now in flower. For elegance of form, delicious fragrance, and freedom of flowering, it is not surpassed by any plant in cultivation. May be viewed every day (Sundays excepted). Admittance gratis.

TREES, SHRUBS, ROSES, VERBENAS, &c., FOR THE MILLION.

DAVID FERGUSON, LANDSCAPE GARDENER, CONTRACTOR, PLANTER, &c., offers common Laurels at 1l. to 5l. per 1000; if 100,000 are taken 10,000 will be added. Good standard Roses, 3 to 6 feet, 5l. per 100, and 40l. per 1000. Berberis aquifolium, fine, 1l. to 3l. per 1000. Evergreen Privet, strong, 1l. to 1l. 5s. per 1000. Cotoneaster microphylla, for hedges, &c., fine, 10s. per 100, and 4l. per 1000. Also large quantities of the following at low prices:—Fine specimen Cedrus Deodara and Pinus excelsa, 4 to 6 feet in height, in pots; fine specimen Arbor-vitæ, Aucuba japonica, Yews, Box, Phillyreas, red Cedars, Araucarias; Scotch, Silver, and Spruce Firs; Larch, Oak, Elm, Ash, Lime, Hornbeam, Hazel, double pink and scarlet Thorns, fine maiden Peaches and Nectarines, worked from trees in the houses on the spot; some of the fruit was exhibited at Regent-street, and received a Banksian Medal, this season, though very inferior to what D. F. has sent to his fruiterer at different times this season, which can be proved; with large quantities of other Fruit Trees. Also first-rate Verbenas, Petunias, Calceolarias, Geraniums, Fuchsias, Anagallis, Salvias, Cupheas, &c., for bedding out, at 1s. 6d. per dozen, if 5 to 20 dozen are taken; 1s. 3d if 20 to 50 dozen are taken; above 50 dozen, 1d. each; and if 100 dozen are taken, 5 dozen will be added. Carriage free to London, Birmingham, Leamington, Peterborough, Banbury, Bedford, and all intermediate stations on the North-Western Railway.

Lists marked for selection at the above prices sent free on application; but to those not already in possession of a collection, D. F. advises parties to state the colour and quantity they want, and leave the selection to him; and to those that have no convenience for wintering plants, they will find it advantageous to give their annual orders in August and September for the following spring, as they, on taking five dozen and upwards, will have the choice not only of those marked in the list, but any other bedding out plant, if possible to procure, at equally low prices.

Letters directed Buckingham, in place of Aylesbury, reach D. F. one day sooner, where all Post-office orders are requested to be made payable.

MAGNUS'S ENAMELLED SLATE is handsomer and more durable than the choicest Marbles, is less than half the cost of the commonest, and is PATRONISED by her MAJESTY and PRINCE ALBERT, the Nobility, Clergy, Architects of Eminence, Engineers, Builders, Railway Contractors, and the Public generally. It is suitable for Chimney-pieces, Pier-table tops, Vases, Ink-trays, and ornaments of various descriptions, Billiard-tables, Baths, Wash-stand, and Dressing-table Trays, Door Furniture, Candelabra, Columns, Monuments, Head Stones, Mural Tablets, Pilasters, Plinths, Fonts, Grand Staircases, Balusters, &c., and is made to represent not only the marbles in ordinary use but all the more costly descriptions, as Porphyry, Rose Granite, Broccatella, Brescia, Lapis Lazuli, Malachite, and Florentine Mosaics, and has obtained the Medal from the Society of Arts. Bored Chimney-pieces, from 25s. upwards. Price lists sent on application to Mr. MAGNUS, PIMLICO SLATE WORKS, 39 and 40, Upper Belgrave-place, London.

*** Roofing and Plain Slate work, of all descriptions, at low prices.

AMERICAN PLANTS.

JOHN WATERER'S CATALOGUE OF AMERICAN PLANTS, ROSES, CONIFERS, &c., is now published, and may be had gratis on application. It describes the colours of every Rhododendron worthy of cultivation, thus affording purchasers every facility in making selections.

American Nursery, Bagshot, Surrey.

THE SOUTH OF ENGLAND HORTICULTURAL SOCIETY.—A Grand Exhibition of FLOWERS, FRUITS, &c., will take place (by the kind permission of Major Colt), upon his beautiful Grounds at ROWNHAMS, near Southampton, on THURSDAY, the 5th of September. Every arrangement will be made to promote the comfort of the visitors, as well as the attraction of the Fêtes. The whole of the arrangements will be made under the direction of Mr. Ross, of the Horns, Nursling. Lady Mill, Mrs. Chamberlayne, and Mrs. Colt have kindly consented to patronise the exhibition. The Lady Patronesses' private Subscription Prizes will be given extra to Cottagers within eight miles of Rownhams, for the best collection of Fruits, Flowers, and Vegetables. The Gardens will be open at half-past 1 o'clock. Admission Tickets, previous to the 3d of September, 1s. 6d.; after that day, 2s. 6d., to be obtained at the following places: Horns Inn, Nursling; Messrs. Hacker, Marshall, and Jolliffe, Southampton; Messrs. Jacob and Johnson, Winchester; Mr. Newman, Swan, Romsey; Mr. Dyett, Red Lion, Totton; Mr. Adams, Anchor, Eling; Mr. Lowman, Crown, Lyndhurst; Mr. J. Keynes' Nursery, Salisbury; Mr Emanuel, High-street, Portsmouth; at the *Hampshire Advertiser* Office, Southampton; and of the Secretary. Colonel Yea and the Officers of the Royal Fusiliers have kindly placed their band at the disposal of the Committee.

Persons attending the Exhibition are requested to enter by the Nursling Lodge, and retire by the Baddesley Lodge.

CUCUMBER AND MELON BOXES AND LIGHTS.

One hundred 1, 2, and 3-light Boxes and Lights of all sizes ready for immediate use. Warranted best materials, packed and sent to all parts of the kingdom; 2-light Boxes and Lights from 1l. 4s. Garden Lights of every description, Conservatories, Green and Hot-houses, made and fixed in all parts of the kingdom. References given to the Nobility, Gentry, and the Trade, in most of the counties of England. JAS. WATTS, Hothouse Builder, Claremont-place, Old Kent-road, London.

MITCHELL'S MINERAL BLACK PAINT.—This antiseptic Paint is intended for Park Fencing, and for all farming purposes; it is particularly adapted, by its prevention of dry rot in timber and repellance of damp, for Barns, Stables, Outhouses, Weather Boarding, Hop-poles; also for Carts, Waggons, &c., particularly the Wheels, and for Iron Hurdles, Iron Railings, and all Wood or Iron Work in exposed situations. For Brick Walls it is highly serviceable as a preventive of damp, and also for Walls intended for Fruit Trees, as, besides preserving the Wall, it increases the heat in all situations exposed to the sun, and prevents the harbouring of insects. It is also an excellent covering for Canvas, or Cart Tilts, Roofing, &c. Sold in casks containing from 1 cwt. to any quantity, at 17s. 6d. per cwt., quite ready for use, by

JAMES PHILLIPS and Co. (he sole agents), 116, Bishopsgate-street, Without, London.

MILLINGTON'S SHEET GLASS, which is of the best description, varying from 16 to 32 ounces, at from 2d. per foot and upwards; 100 feet and 200 feet cases of large Sheet Glass, for cutting up, at 2½d. per foot. British Plate Glass, from 1s. 2d. to 2s. per foot, according to size. Patent Rough Plate Glass, from ½ to 1 inch in thickness, from 4d. per foot upwards. Glass Slates and Tiles. Milk Pans from 12 to 24 inches diameter, from 2s. to 5s. each. Cucumber Tubes, from 12 to 24 inches long, at 1d. per inch. Lactometers, 7s. 6d. each. Wasp Traps.—Lists may be had, on application at the Warehouse, 87, Bishopsgate-street Without, same side as the Eastern Counties Railway.

CARSON'S ORIGINAL ANTI-CORROSION PAINT, especially patronised by the British and other Governments, the Hon. East India Company, the principal Dock Companies, most public bodies, and by the Nobility, Gentry, and Clergy, for out-door work at their country seats, The Anti-Corrosion is particularly recommended as the most durable out-door Paint ever invented, for the preservation of every description of Iron, Wood, Stone, Brick, Compo, Cement, &c., work, as has been proved by the practical test of upwards of 60 years, and by the numerous (between 500 and 600) testimonials in its favour, and which, from the rank and station in society of those who have given them, have never yet been equalled by anything of the kind hitherto brought before the public notice.

Lists of Colours and Prices, together with a Copy of the Testimonials, will be sent on application to WALTER CARSON, No. 9, Great Winchester-street, Old Broad-street, Royal Exchange.

No Agents.—All orders are particularly requested to be sent direct.

AYLESBURY DUCKS (White).—The Advertiser has for Sale a limited number of the above, in fine healthy birds, of this season; the breed is warranted pure and of the largest known, weighing, when fattened, 8 lbs. to 10 lbs. each. Price, including package, 8s. 6d. per couple.—Orders, accompanied by Post-office orders or reference, addressed to ISAAC BRUNNING, North-end, Great Yarmouth, will receive prompt attention.—August 31.

EMIGRATION.—A respectable, middle-aged married Man is desirous of an engagement to go out to the Australian Colonies. He is a good AGRICULTURIST, and has had considerable experience in the management and buying and selling of Stock and Grain. Would not object to a situation as Bailiff, either at home or abroad. The highest testimonials can be given as to character.—Direct to J. W., 94, Murray-street, Hoxton, London.

EMIGRATION TO AUSTRALIA.—New Line of Packets from Liverpool. Fine Goods 25s. per Ton.

PETREL ... 1200 Tons. To Sail 10th October.
CONDOR ... 1500 Tons. To Sail 10th December.

A 1. New Ships coppered and copper-fastened. For Freight or passage, apply to the Owners, GIBBS, BRIGHT, and Co., Liverpool.

NEWS, NEWS, NEWS.—The best, cheapest, and largest Newspaper in the World.—LLOYD'S WEEKLY LONDON NEWSPAPER contains 60 large columns of the latest intelligence from all parts of the Globe, price only Threepence, postage free. Send Three Postage Stamps to E. LLOYD, 12, Salisbury-square, London, and receive one copy as a sample.

CROGGON'S PATENT IMPROVED ASPHALTE FELT, as a Protective Material for Plants. Price 1d. per square foot. The following paragraph has appeared in the *North British Agriculturist*, voluntarily written by Mr. M'INTOSH, of Dalkeith: "We have used CROGGON'S PATENT FELT very extensively as a substitute for Russian mats for the protection of half-hardy trees and plants, covering alpine and cold pits, as well as those heated, and have found it a most economical and efficient protection. Its non-conducting properties, as well as its resistance of wet, renders it a valuable garden material for covering plants requiring protection from frost. Applied over glass in heated pits, it reduces the consumption of fuel more than one-half, while it greatly prevents the breaking of glass by the expansion of condensed steam, rain-water, &c., when frozen between the laps, which is well known to be the principal cause of breakage of glass in horticultural erections. The majority of greenhouse plants may be safely wintered in pits or houses, without the expence or trouble of heating, by merely covering them with this material, which, for convenience of taking off and putting on, should be made into frames of the exact size of the glass sashes, and made to fit between the rafters, and at a distance of 2 or 3 inches from the glass, enclosing a volume of air between them, which is found to resist cold better than when laid close upon the glass. In regard to durability, we have some of such frames which have been in constant use for the last 9 or 10 years. It is applicable also to conservative walls."—Sold in rolls 32 inches wide, by CROGGON and Co., 2, Dowgate-hill, London, whose Non-conducting Dry Hair Felt, when applied to Hot Water or Steam Boilers, saves 25 per cent. of fuel.

A LIST OF NEWLY INTRODUCED PLANTS NOW OFFERED FOR THE FIRST TIME BY JAMES VEITCH AND SON, EXETER:

Escallonia macrantha, 21*s.* each; one over to the Trade on three.

Ixora salicifolia, 21*s.* each; ditto.

Dipladenia urophylla, 21*s.* each; ditto.

Hoya coriacea 10*s.* 6*d.* each; ditto.

Dipteracanthus spectabilis, 10*s* 6*d.* each; ditto.

Oxalis elegans, or Oxalis elegans major, 5*s.* each, or three for 10*s.* 6*d.* of either.

Calceolaria grandis, 5*s.* each, or three for 10*s.* 6*d.*

NEW SEEDLING STRAWBERRY—MYATT'S "SURPRISE."—This is a variety raised from the British Queen, which it resembles, though of a more robust habit, and a very free bearer, producing a greater abundance of those large angular-shaped Strawberries than any other variety, and finishing off the last fruit of a good size, price 50*s.* per 100.

Also Myatt's Eleanor, 5*s.* British Queen, Globe, Mammoth, Comte de Paris, Hooper's Seedling, Keens' Seedling, Swanston's Seedling, Elton Pine, 3*s.* 6*d.* Fertilised Hautbois, 5*s.* Cuthill's Black Prince, 10*s* 6*d* per 100. Kitley's Goliah, 3*s.* 6*d.* per doz., or 20*s.* per 100.—Manor Farm, Deptford.

MESSRS. STANDISH AND NOBLE'S new descriptive CATALOGUE OF SELECT HARDY ORNAMENTAL PLANTS is just published, and may be had for four postage stamps. Besides a Treatise on the cultivation of American Plants, it contains a Plate and Description of the Funebral Cypress, Notices of Cephalotaxis Fortunii, Cryptomeria japonica, Quercus sclerophylla and inversa, Viburnum plicatum and macrocephalum, with many recent introductions from the north of China, quite new to English gardens.

Messrs. S. and N. take this opportunity of stating that they give Designs for Laying out New Grounds and Plans for Improvements; also Estimates for all kinds of Planting, whether ornamental or economic.—Bagshot Nurseries, Aug. 31.

NEW HYACINTH SUPPORT.—HOOPER AND CO., CENTRE AVENUE, COVENT GARDEN MARKET, invite the attention of the Flower-growing Public to their new and perfect

SUPPORT FOR HYACINTHS IN GLASSES.

Its excellence consists in its being neat in appearance, easily applied, keeping the bloom erect almost without being visible, and suited to every size and shape of Hyacinth Glass.

May be obtained of the principal Seedsmen and Florists.

UNIVERSITY COLLEGE, LONDON.—JUNIOR SCHOOL, under the Management of the Council of the College.

Head Master—THOMAS HEWITT KEY, A.M.

The School will open on TUESDAY, the 24th of September. The Session is divided into three terms, viz., from the 24th of September to Christmas, from Christmas to Easter, and from Easter to the 1st of August. The yearly payment for each pupil is 18*l.*, of which 6*l.* are paid in advance in each term. The hours of attendance are from a quarter past 9 to three-quarters past 3 o'clock.

The afternoons of Wednesday and Saturday are devoted exclusively to Drawing.

The Subjects taught are Reading, Writing, the English, Latin, Greek, French, and German Languages, Ancient and English History, Geography (both Physical and Political), Arithmetic and Book-keeping, the Elements of Mathematics and of Natural Philosophy, and Drawing.

Any pupil may omit Greek, or Greek and Latin, and devote his whole attention to the other branches of education. There is a General Examination of Pupils at the end of the session, and the Prizes are then given.

The discipline of the School is maintained without corporeal punishment. A Monthly Report of the conduct of each pupil is sent to his parent or guardian.

Further particulars may be obtained at the Office of the College. CHARLES C. ATKINSON, Secretary to the Council.

The College Lectures in the Classes of the Faculty of Medicine commence on the 1st of October; those of the Faculty of Art on the 15th of October.—August 31.

The Gardeners' Chronicle.

SATURDAY, AUGUST 31, 1850.

MEETINGS FOR THE ENSUING WEEK.

TUESDAY, Sept. 3—Horticultural .....3 P.M.
WEDNESDAY, " 4 Royal South London .....1 P.M.
COUNTRY SHOWS.—Monday, Sept 2: Birmingham and Midland Counties Dahlia—Tuesday, Sept. 3: Halstead Floral and Horticultural—Wednesday, Sept. 4. and Thursday, Sept 5: Newcastle-on Tyne Horticultural.—Thursday, Sept. 5: North Wilts Horticultural, and Liverpool Horticultural.—Friday, Sept. 6: Newbury Horticultural.

A SHORT paragraph in last week's "Newspaper" of the *Gardeners' Chronicle* gives a very inadequate idea of the result of a most interesting attempt at procuring cheap and instructive AMUSEMENT FOR THE agricultural POOR. Prof. HENSLOW is represented to have given an excursion and entertainment "to his poorer parishioners, who, to the number of about 200, left Hitcham at an early hour, and, under the charge of the Professor and several farmers of the parish, arrived by the railway at Ipswich about 9 o'clock, where they embarked in a steamer for Landguard Fort, the scene of the day's festivities." From this it would be inferred that Prof. HENSLOW himself paid the cost of the excursion. Such was by no means the case; quite the contrary. It is an important element in such arrangements that the *people should contribute* something towards them. They all paid alike (1*s.* 6*d.* this time) for their tickets, and they have declared that they did not grudge the money "one mite." Now 1*s.* 6*d.* and the loss of a day's work is no small sacrifice for a labourer. Then the doubling this for wife or sweetheart, and perhaps throwing in a trebling for a wayward child, really makes it a serious amount. But once in the year, a holiday of this kind (provided they get VALUE for their money) is well worth while for them, and a little help may be given here and there where most needed.

It is now, we believe, two years since an attempt was made at Hitcham to get up such little village excursions. On the first occasion not more than 80 labouring people formed the party. This year the number was limited to 199 from the village, exclusive of farmers, &c. An eye-witness of what passed describes it thus: "We had a most glorious day, without a single *contretemps* beyond some of the ladies getting their faces scorched. One young lady had her cheeks regularly blistered by the reflection from the water. The soldiers of the fort *fraternised* with us, played cricket, brought out a couple of great guns, and manœuvred them to please us—helped us in every way. After our dinner on tables and forms from the garrison, the forms were ranged in a large square, the 200 were seated upon them with their faces inside, and half a dozen of us walked round and *fed* them with a spoonful or two of ice cream, manufactured on the spot, with a large block of Wenham lake ice to kick about, cool the lemonade, &c. The whole affair, with the addition of scrambling for Nuts and Walnuts, &c., was most joyous. There were three or four of the Professor's Quaker friends and their families, who were the grand *promoters of the fun*, and, on reaching the wharf just one minute too late for the train, we all adjourned to the gardens of one of them (a banker in Ipswich), where he re-fed the whole party, and we enjoyed ourselves till a later train. I got home by 11 P.M. The waggons with the labourers reached Hitcham by midnight, and I heard of nothing but satisfaction. It was amusing, on crossing over the slight sand-bank before coming to the shore at Landguard Fort, to see the general rush and shout that was raised as down they stooped to examine the sea-weed."

Although the success of adventures of this kind depends a good deal upon securing some zealous coadjutors, yet no zeal can compensate for a want of the knowledge of practically working out the details. We are therefore happy to do something towards pointing out the mode of proceeding, by reprinting the following hand-bill, of which we have chanced to procure a copy, and which may be safely taken as a guide on all similar occasions, of which we hope in time to hear of many.

HITCHAM EXCURSION TO IPSWICH AND LANDGUARD FORT,

ON TUESDAY, 30TH JULY, 1850.

I. According to my expressed determination last year, I am making arrangements for a Village Excursion to Ipswich and Landguard Fort: having received assurances that we shall be welcomed at both those places.

II. The successful issue of such an Excursion (provided no untoward accident should occur) will mainly depend upon a general attention to a few Rules, which I here propose to those who wish to accompany me.

III. Every one is to be in good humour, accommodating towards all, and especially attentive to the ladies of the party. If the weather should prove unpropitious, every one is to make the best of it, and not to complain more than he can possibly help.

IV. Those who are invited on the present occasion are the Occupiers of Farms in Hitcham, the Resident Members of the Stoke and Melford Club, and those who attend the Adult Class on Saturdays. Every one who joins the party may also name a friend residing in Hitcham, for whose good conduct he will be responsible.

V. The tickets to be issued will be limited to 200, at 1*s.* 6*d.* each. All applications to be made at the Rectory on or before Friday the 26th. Should any tickets remain unapplied for after that day by the parties invited, those who have already received tickets may apply for more, for other friends. By this arrangement I hope to accommodate all, or nearly all, who may be wishing to take part in the excursion.

VI. The party are to assemble on the platform at Stowmarket by half-past 8.

VII. As the object of the party is not to be mere eating and drinking, but wholesome recreation to body and mind, the refreshments provided will consist of bread, cheese, butter, cake, with lemonade, and one or two pints of beer for those who may apply for an order to that effect when they receive their tickets. These orders for beer are not to be transferred to other parties; and if not needed are to be returned.

VIII. Should any one be prevented at the last moment from joining the party, 1*s.* of the money paid will be returned; and the remaining 6*d.* will be appropriated towards the expenses that will have been incurred, upon the supposition that such person would have been of the party.

IX. Every one must contrive for himself how to get from Hitcham to Stowmarket, and back again. If he is not able to persuade any one to give him a lift, he must consent (as others have done before) to wear out a little shoe leather. J. S. HENSLOW.

HOW TO MISMANAGE A GARDEN.

CHAPTER IV.—IT has been seen that procrastination and disorder are to be steadily observed in all well-mismanaged gardens. They are, in fact, so essential that it is doubtful whether, in their absence, any other invention for spoiling a place will be effectual. Fortunately, however, they are pretty generally united with many other customs to which attention must be paid by him who would excel his neighbours in this art.

Manure, for instance, is not unfrequently at the root of capital mismanagement. It is folly to say that a garden wants manure as much as a farm; and hence the practice of those gentlemen is to be highly commended who send all the products of the stable and cattle-yards to the farming-bailiff, instead of the gardener. Nay, who, if a hotbed is exhausted, cart it off to the fields, instead of letting it serve for the uses of garden crops. Turnips and Beet and field Beans, we all know, must have manure, and plenty of it; but the refuse of the shrubberies, with Grass-mowings, leaves, and rotten vegetables, are sufficient for the gardener. What does *he* want with manure? Geraniums and Verbenas, and shrubs and flowers, can't want manure. Seakale and Celery, and Cabbages and Parsley, are wild plants, and what do wild plants want with manure? People talk of growing Mushrooms upon hotbeds; but they grow well enough in the fields without a hotbed, and why should they want one in a garden? There is no doubt that reasoning of this kind is to be taken as a certain sign of good mismanagement. To be sure it may be said that one does not find on the cliffs such Cabbages as appear in gardens; and that the Celery which grows in salt marshes is not exactly like what is brought to table: but what is that to the mismanager? Does he not know that a Cabbage is a Cabbage after all, and that the difference is in the sort, not in the nature of the plant.

"I wish, Mr. Smith, that you would keep the borders of these old shrubberies always gay with flowers. It is very disagreeable to my lady when she comes down here in the autumn to see nothing but green bushes, without a flower among them." It was thus that the young Earl of Retford addressed the old gardener who had charge of the grounds round his shooting box on the borders of the moors. —"Certainly, my lord," was the reply, "if your lordship will allow me some dung; for the borders have been run out years ago; and nothing will grow in them now except the bushes."—"Manure for flowers, Mr. Smith! why I have been always told that it spoils them. However, speak to the steward." —But the steward was of opinion that what little stable litter was made by my lord's horses, while staying at Basledem, could be much better employed in making a hotbed for Melons in his own garden; and therefore Mr. Smith got none. The old gardener was of course driven to the usual expedient of doing without; and in the next spring his choicest flowers were carefully planted all round the shrubberies as my lord desired. But they did'nt grow much; some died; some bore a few flowers; most were stunted or spindling things; even the Hollyhocks hardly showed their heads above the bushes. When Lord Retford revisited his lodge, his first remark, as he drove up to the house was, that Smith had as usual neglected the flowers. "Really," said his lordship, "this is insufferable; the man grows fruit and vegetables well; but as to flowers he knows nothing about them. I think I shall send to Sir Peter Glow's for one of his flower garden men, and get rid of this old blockhead." It was useless for Smith to explain that he had mismanaged, according to the instructions of the steward; or to say that it was hard upon him to insist upon his growing flowers in old borders full of roots, from which even the leaves had been carefully swept for years. It was all in vain; flowers could not want manure; the steward said so; my lord always trusted to him, for he was a capital judge of horses, and a very clever fellow; and Mr. Smith received his discharge. There can be no doubt that Smith was wrong; the poor man was a good manager, and that did not suit the steward. It would never do to have about my lord a fellow that pretended to know more than he the steward knew. As to gardening, why anybody could garden.

It cannot be denied that this kind of mismanagement is much to be approved of. Gentlemen who have a gardener should always take the opinion of the steward in preference; or of the butler; or of the valet; or of the lady's-maid. Servants of that rank are generally persons of genius; and knowing nothing about the matter, are sure to give advice free from the prejudices of class. That they will disallow the use of manure is certain; firstly because it saves outlay, a great object with all mismanagers, who look to present expense and not to future gain; secondly, because it is dirty and littery, and offends the delicacy of their nostrils; and moreover because it is connected with what they call "the association of ideas." No person of delicacy could endure the thought of eating fruit and vegetables produced by the aid of that horrid stuff.

Let no manure then find its way into a garden; compel the gardener to do without it: disregard his assurances that the land is run out, or out of all heart; and if he will prevent the crops from succeeding, stop his grumbling by discharging him. You will soon get another: and in servants, as in all things else, variety is charming.

DESCRIPTION OF THE VICTORIA REGIA HOUSE AT CHATSWORTH.

In fulfilment of the promise given at p. 451 of the present volume, we now lay before our readers the plans and elevations of the hothouse erected at Chatsworth, for the cultivation of the Victoria Lily, together with descriptions and explanations by Mr. Paxton himself. In a mere gardening point of view, this structure is of great interest, showing, as it does, in how simple a manner large spaces may be covered with glass, and yet be suited for all the purposes of cultivation. It will also indicate the earliest conception of that palace of glass which is to receive the products of industry of all nations, in 1851, and which was thus described by Mr. Paxton to the great meeting at Bakewell:

"The building will be 2100 feet long by 400 broad. The centre aisle will be 120 feet broad, or 10 feet wider than the Conservatory at Chatsworth. The glass and its iron supports comprise the whole structure. The columns are precisely the same throughout the building and will fit every part; the same may be said of each of the bars; and every piece of glass will be of the same size, namely, 4 feet long. No numbering or marking will be required, and the whole will be put together like a perfect piece of machinery. The water is brought down valleys on the roof, and thence down the columns; the water in no instance has further than 12 feet to run, before it is delivered into the valleys or gutters; and the whole is so constructed as to carry the water outside, and the condensed water inside. The building is divided into broad and narrow compartments, and by tying these together there is little for the cross-ties of the centre to carry. The building is entirely divided into 24 places—in short everything runs to 24, so that the work is made to square and fit, without any small detail being left to carry out. The number of columns 15 feet long is 6024; there are 3000 gallery bearers; 1245 wrought iron girders; 45 miles of sash bars; and 1,073,760 feet of glass to cover the whole. The site will occupy upwards of 20 acres of ground, but the available space which may be afforded by galleries can be extended to about 30 acres, if necessary."

Fig. 1 represents the ground plan, which is 61 feet 6 inches long, and 46 feet 9 inches wide over walls. The circular tank is 33 feet diameter, and the centre part, which contains the soil for the plant, is 16 feet diameter. The eight tanks in the four angles are filled with aquatic plants of various kinds. The house is heated by a series of 4-inch cast iron pipes all round the inside of the external walls, proceeding from a Burbidge and Healey's boiler, and Sylvester furnace. The tanks are heated by 4-inch pipes, underneath each, as shown in the section; and by smaller sized lead pipes resting on the paved ledge of circular tank, also shown in the section. There are 30 openings between the piers, all round the house, for ventilators. Different compartments of the roof are also made to open by simple machinery, for the purpose of ventilation. The pathways are raised 3 ft. 6 in. above the general level outside, and the roof is supported by light wrought iron beams, resting on the eight internal columns, as shown on the ground plan.

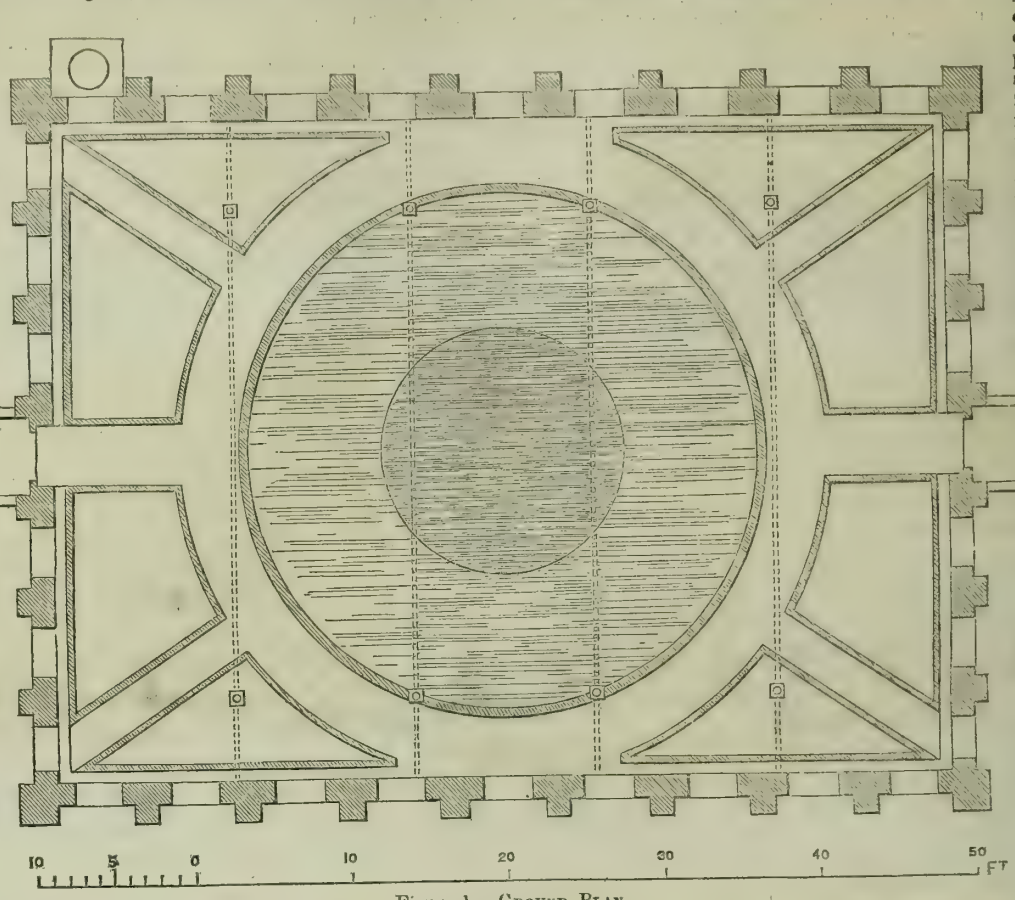

Figure 1.—Ground Plan.

Fig. 2 is a transverse section of the building, which shows a section of the circular tank, with the pipes under the centre part, and the small pipes on the paved ledge, forming the shallow part of the tank. Also the side pipes, and the manner of fixing the cast iron columns; together with the construction of the roof and its gutters, facia board, &c. The wrought iron beam shown in this section has a bearing in the middle, over the great tank, of 31 feet 3 inches. The height of the masonry, from the ground to the top of the coping, is 4 feet 9 inches; the column and arch 10 feet 6 inches; the plating and facia board 2 feet 1 inch, making the whole height from the ground line 27 feet 4 inches. By this section it will be seen that the upright sashes are placed behind the cast iron columns, so that the shafts of the pillars are isolated.

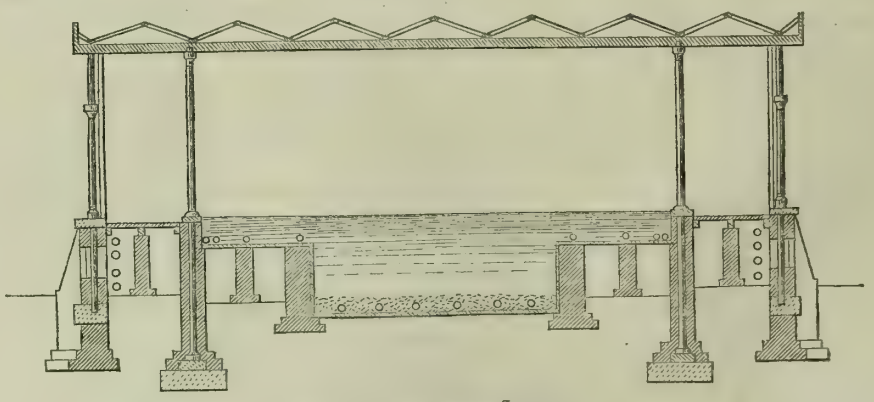

Figure 2.—Transverse Section.

Fig. 3 represents the end elevation, and shows the steps ascending to the entrance, the ventilators, cast iron arches, and facia board over the plating. The upright glass is 10 inches wide between the bars, and each spandrail between the arches is filled in with one piece of plate glass. The columns are 6 feet 6 inches from centre to centre, and the side elevation of the building presents a series of nine arches, as shown in the exterior view.

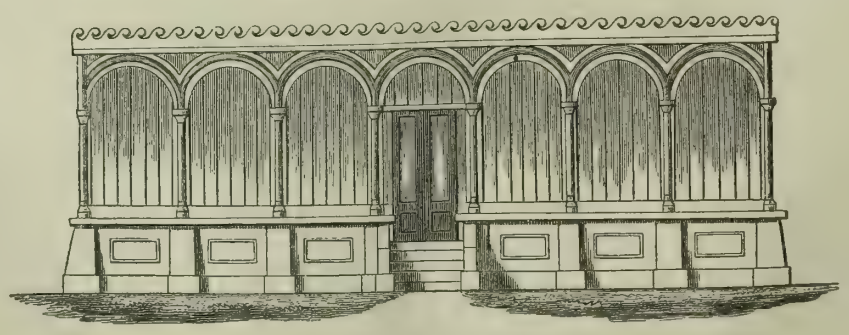

Figure 3.—End Elevation.

Fig. 4 is a parallel perspective representation of the interior, showing the internal construction, the mode of supporting the longitudinal ridge and valley, wooden rafters of the roof, &c.

Fig. 5 is an angular view of the building; both ends are alike, and both sides are of the same form. On the east side, which fronts the park, the masonry is partly hid by artificial rock work, and the ends and steps to the entrances are adorned with ornamental plants.

Construction: Mason, and Castings.—The foundations of external walls and tank walls are built of solid rubble work, well bedded in mortar. The curb of circular tank above the pathways, and curbs of the angular tanks, are of brick, cemented. The tanks are laid with pavement and covered with lead. The external walls are built of pick scappled coursed wallstone, with piers battering 9 inches, and a plinth formed of two courses of wallstone projecting 2 inches. The steps to entrances and curb walls bounding them are of rubbed grit stone, and the walls are covered with neatly boasted and weathered coping. The cast iron columns are 4 inches at the lower diameter of the shaft, and 3¼ inches in the upper diameter. The cast iron of the arches is 3¼ in. wide, by 2½ inches thick, chamfered. The wrought iron beams are 5 inches by 1 inch, with tension rods 1 inch in diameter.

Carpenter, &c.—The platings are 5 inches by 12 inches, the valley rafters of roof, 6 inches by 4 inches; and the ridge rafters, 5 inches by 3½ inches; with strengthening pieces over each iron beam, and sash bars 1½ inches deep. The ventilators are bead and flush, hung on the pivot and socket principle, in rebated wooden frames. The stiles and arches of upright sashes are 2 inches thick, together with the doors, which are framed and panelled, and furnished with brass locks and brass butts. The pathways are laid with 1½ inch Larch boards, ¼ of an inch apart, radiating round the centre tank, and resting upon Oak sleepers 4 inches by 3 inches. The roof ventilators are framed and glazed, and hinged to the rafters. The facia boards are wrought and cut out, as shown on the upper part, with mouldings planted on the plating, to form a cornice. The scroll is completed by painting in different shades. The curbs of all the tanks are finished with a neat rounded edged wooden capping, and the circular tank is provided with a neat railing and hand rail all round. The whole of the house is glazed with sheet glass 4 feet long by 10 inches wide, without overlaps in upright sashes, all being close jointed. Every part of masonry or brick work seen from the inside is covered with cement, and the whole of the structure, both externally and internally, is thoroughly painted in suitable and ornamental colours. The accompanying design, described in the foregoing paragraphs, is the type of my design for the building for the great industrial exhibition of 1851. When the

large conservatory at Chatsworth was built, a great point was gained by being able to have the glass manufactured in sheets of 4 feet in length; but since that period the improvements in different branches of manufactures have enabled me to make the present Lily-house (though comparatively small) of a much more light and elegant appearance.

It occurred to me that it only required a number of such structures as the Lily-house repeated in length, width, and height, to form, with some modifications, a suitable building for the exhibition of 1851. Hence arose the design for that structure, and the subsequent honour conferred on me by its unqualified adoption by her Majesty's commissioners. *J. Paxton, Chatsworth, August* 13.

VILLA AND SUBURBAN GARDENING.

The production of early Strawberries with anything like success demands a considerable amount of care on the part of the cultivator. The first thing to be considered is the temperature, where houses or pits are exclusively set apart for their culture. This can readily be controlled; not so, however, where they are forced with other plants. In this latter case a crop must always be a matter of uncertainty.

When Strawberries are first removed from the open air and placed under glass, the temperature should not for some weeks exceed 52°. When flowering commences, the warmth may be increased a few degrees, and the fruit may be ripened in a temperature of from 60° to 65°. One very important point is to place the plants close up to the glass. The nearer they are kept to the light the better; there is little chance of securing a crop unless this is attended to. For this purpose temporary stages will be found a great convenience. These can be removed when the fruiting season is over, to make room for any other crop. The free access of air must be attended to, more especially during the period when the plants are in bloom. The fruit will not set well, if at all, unless an abundant supply of pure air is admitted on all favourable occasions; indeed some of our best growers admit air night and day, except in very severe weather; where a perfect command of heat is obtainable, the aeration can be much more satisfactorily conducted.

It is the practice of good cultivators to place each pot in a shallow pan, in order to be enabled to supply the plants more abundantly with moisture; but they must not be overdone in this respect. In dry weather, when they are supposed to suffer most, this moisture will be found of vast service, and they will succeed under such circumstances much better than if placed upon a shelf without pans.

I have proved another plan to be even better than the earthenware pans, and where opportunity offers of practising it, I would strongly and confidently urge its adoption. Cut fresh turves from a common or old pasture, 2 inches thick and 9 inches wide. These may be of any convenient lengths; place them on stages, with the grassy side downwards, and set the plants on them. The water administered, and especially the liquid manure which passes through the soil, and escapes at the bottom of the pots, will be absorbed by the turfs. This will constitute a supply for the plants in the most natural manner, as the roots will soon pass through the holes at the bottom of the pots, and penetrate the turf. The liquid manure which these turfs have absorbed will sustain the plants in a surprising manner, and the moisture which they give out under powerful sunshine will be highly beneficial.

The Strawberry plant under glass is extremely liable to be infested with green-fly, but this can be readily subdued by frequent fumigation. This should be especially attended to, and accompanied with frequent syringings. *Pharo.*

Home Correspondence.

Fixed Filters in Wells.—Perhaps a rainy day in the muirs may be turned to the advantage of some of your readers, by describing a new adaptation of a filter which I have recently tried with the best results. I formerly made some communications to you on this subject, which has been again agitated of late in the *Chronicle*. And your recommendation of charcoal, which I have adopted with good effect, coupled with the hint suggested by the floating filter (a patented article, some time ago described and engraved in the *Illustrated London News*), gave rise to the following experiment, which is not patented, but much at the service of any of your readers who may find it useful. It was successfully tried on as unpromising a chalybeate as could well be adventured on. It should be equally useful for a rain-water tank or well, having its bottom covered with charcoal, to preserve the freshness of the stagnant water. The chalybeate in question was strongly impregnated and flavoured with iron, threw up an oily scum, and on standing for a day, became of a brown tinge; when mixed with brandy, the grog was nearly black. The well being shallow was soon pumped dry, when I found its available depth below the cradling to be only some 3 feet; the sides consisted of a stratum somewhat resembling fine clay, mixed with stones of different kinds; a grey freestone rock of a most disagreeable pitchy odour, lay about a foot below the bottom of the well, and I endeavoured to carry down the cradling through the clayey substance to the rock, by removing it piecemeal. This process, and the necessary drying of the well in order to carry it on, brought the whole down; no one was in it, fortunately. On clearing out the rubbish, the well was found to be supplied by a spring, which oozed slowly through a portion of the above mixed clayey substance. To obtain greater depth, the rock was excavated to a depth of 10 feet, and the total supply was thus increased to 13 or 14 feet. In rebuilding the well, I had the space between the cradling and the surrounding ground, from which the water flowed, completely packed with sand and gravel. This filter somewhat improved the purity of the water; but its strong iron taste and oily scum remained in full vigour. Something more was therefore indispensable; and the plentiful supply of water I had thus obtained, in place of an original depth of only 3 feet, instigated me to further experiments, to convert it into some use. With this view I procured a barrel of about 4 feet in height; its bottom was perforated with holes, to allow the entrance of the water there. This arrangement also gave me the advantage of the increased pressure of a column of water, to the extent of these four additional feet, besides being necessary for the other mechanical appliances contemplated. A piece of canvas was fixed inside the barrel, over this perforated bottom, for the double purpose of retaining the superincumbent sand in the filter, as well as to aid the latter, as the sponge does in Robins'. Over the canvas was packed 9 inches of fine sand, mixed with a little very small gravel; then another layer of canvas, then 9 inches of charcoal, then a layer of canvas, then 9 inches of sand and gravel, then canvas, and lastly a perforated top was fastened firmly over the whole. Thus the entire filtering apparatus occupied rather more than one-half of the lower part of the barrel, leaving the rest or upper part as a reservoir for the already filtered water. The pipe of a pump was then fitted into the lid of the barrel, air-tight; and the barrel containing the filtering apparatus, after being fastened to a tressle about 3 feet high, was let down to within that distance of the bottom of the well; that space was left below, in order to obtain the supply from a cleaner body of water than the suction caused by the action of the filter might have produced, had it been placed near enough the bottom to agitate the deposit. It will be obvious that when the

pump was used, the air in the upper part of the barrel would be necessarily exhausted, creating a vacuum ; or in other words, the upper part of the barrel then became part of the pump. At first I was apprehensive of the smallness of my reservoir, but on subsequent trial the pressure of a column of water, of the diameter of the well and 10 feet in height, acting through the filter on the inside vacuum above, has been found to force the water so rapidly through it that the supply seems to be afforded much faster than it is possible to pump it off. For a few days the impurity remained with slight diminution, and I began to fear for the success of my experiment ; this, however, seemed to have been merely occasioned by the necessary cleansing of the filter ; for within a week the water was greatly improved in purity, and what is most remarkable the taste of iron became scarcely perceptible. The construction and materials of the filter might be easily and very considerably improved in many respects ; these, however, are minor points. It is the construction and arrangement of a filter, within a well of indifferent water, so as to convert, without any other trouble than the mere act of pumping the impure supply below into a pure stream above, to which I attach any merit of novelty or utility. *R. Stewart.* P.S. Will "B." (see p. 421, 1849) be kind enough to state what description of charcoal he used for keeping the water fresh during the long voyages mentioned in the note of advice appended to my former communication on this subject.

Roberts' Strawberry Tiles.—Early in the spring of this year I saw these tiles advertised in your Paper, and on account of the many good qualities which Mr. Roberts said they possessed, I was induced to purchase 100 of them for trial. The tiles and carriage together cost me 1*l.* 6*s.* I put them down in accordance with Mr. Roberts' directions, on one-half of a bed of Keens' Seedling ; on the other half of the bed I put straw, cut into pieces about 2 inches in length. The part of the bed on which the straw was put produced me at least 50 per cent. more Strawberries ; larger, and as clean and good in flavour as I had on the tiled part. The straw cost me 1*s.*, the tiles 1*l.* 6*s.*, and 50 per cent. of fruit into the bargain—these are facts, and the consequence has been a discontinuance of the tiles, except the placing of one here and there about the garden as traps for snails, &c., for which purpose they are useful. *Fairplay, August 27.*

Potato Disease in Scotland.—Having been for the last month on a tour through the Highlands of Scotland I have taken particular notice of the state of the Potato crop. Until I came here on Thursday last, I was hopeful that the crop would be matured in a healthy state, but I am sorry to inform you that within the last few days the most unfavourable symptoms have appeared ; in this neighbourhood the stalks have all turned black, and in the Island of Iona where I was on Saturday, the crop is entirely destroyed. *Oban, August* 26. [We regret to add that this is from a gentleman well acquainted with the disease—and no alarmist.]

Remedy for Mealy Bug. — Hereman's fluid and Kyle's liquid have been mentioned ; but "A Constant Reader" says of the latter, he "cannot get it." I do not know of any one who sells these mysterious compounds ; but I can with confidence recommend a liquid free from mystery, and that may be applied with safety—spirits of wine. I first tried whiskey ; afterwards I used spirits of wine, dipping the young tender shoots of Justicias, Clerodendrons, Torenias, &c., in it, without their being injured in the least. I have also applied it with a feather and camel-hair pencil. As a trial, let two large mealy bugs be placed on a leaf, touch one with water, and the bug will remain dry and uninjured ; touch the other with whiskey or spirits of wine, it will appear soaked through, die, and turn brown directly. *G. W., Redcar.*

The British Association. — In the *Gardeners' Chronicle* of Saturday, 17th August, in the account of the British Association for the Advancement of Science, I find it stated "that of 25 names upon the Council not a single botanist is to be found." The Council consists of the office-bearers for 1850 and 1851 as well as certain others. Among the office-bearers for 1851, I find Professor Henslow, of Cambridge, a Vice President of the Association, Professor Royle, one of the General Secretaries ; and among the other members of Council I find the names of Dr. Daubeny, and of E. Forbes, the Professors of Botany at Oxford, and at King's College, London, both of whom are enumerated in the same article, page 517, among the botanists who were present at the Edinburgh meeting. Though not referred to by your correspondent, it does not appear that botanists held any inferior position at this meeting, as Mr. Bentham and Dr. Greville were Vice Presidents of the Natural History section, and both a general and a local secretary were botanists. The scientific business of the Association being carried on in different sections, the committees of which generally consist of all those who have paid especial attention to the subject of the section, and who have the power of adding any names to their number, it seems to me that it must be the fault of the cultivators of any particular science if it does not take a prominent position. To the general committee, where the real business of the Association is carried on, all have access who have had a paper printed in any of the Society's printed Transactions. The Council has only a few meetings in the year, and carries out the resolutions of the general committee, and makes arrangements for the next meeting, and has little or nothing to do with particular sciences, except as connected with any resolution of the general committee. I would also ask, do the principal botanists attend the Association regularly or at all ? Does Robert Brown ? Do you ? Does Sir W. Hooker ? I have frequently heard at the Royal Society all of you complained of ? *Quæstor.*——In writing the notice referred to, we merely attempted to give an explanation of a fact which we suppose "Quæstor" will not deny, that little is done in and for botany by the Association. We did not excuse the botanists, but our eye caught the list of the Council for this year, and we found no name there that did not more fairly belong to some other department than to botany. It is well known to every one that both Dr. Daubeny and Professor E. Forbes, although professors of botany, are more devoted to other branches of science, and cannot, we think, be regarded as representatives of botany. We saw also Professor Henslow's name as a Vice-President of the next meeting, but his position in the Council is *ex-officio*, and as their meetings are in London, his influence can be but small, and therefore we expressly alluded to the 25 extra-official members of Council. "Quæstor" seems to know well the nature of the Council and its meetings, but he has certainly under-rated its position in relation to the Association. Although nominally the general committee have the power, the real guiding and directing influence of the Association is the Council. We did not intimate that there was any intentional neglect of botany, but supposing our impression of the importance of the Council wrong, how is it there are so few botanical papers read, and that botanists occupy so little the attention of the section ? We must leave the editor to answer one of the questions at the end of the above note. *Rep. Gard. Chron.* ——[Our reporter's statement will, we trust, be satisfactory to "Quæstor." It is evident that the acquaintance of the former with the machinery by which the British Association is worked is imperfect. No greater mistake could be made than to suppose that what is called the Council, *exclusive of the officers*, is the executive. In reality the business is done by the officers, who are generally the most regular attendants, and often the most efficient members. But even last year Prof. Forbes was on the Council ; Dr. Royle was General Secretary, and Prof. Balfour Local Secretary. We by no means acquiesce in the doctrine that neither Prof. Forbes nor Daubeny are botanists ; on the contrary both are distinguished in branches of that science, and especially in those branches which are best adapted to the purposes of the Association. As the Local Secretaries are those who generally make the arrangements with the Council for the ensuing meeting, they generally attend on some one of the Council Meetings ; so that there were in fact *three* botanists on the Council of last year, and there are *five* this year. Under these circumstances we cannot admit that botany is not fully represented. The real position of a science depends upon the papers read and the business done in the sections. Botanists did little a few years ago, but the Natural History section has greatly improved of late years, and both the botanical and zoological papers are of a different stamp from what they used to be. Though our reporter was mistaken in his views, it would be quite possible, indeed very probable, that a science might not be properly represented, as everything is got through as quickly as possible, and the list of officers of all kinds is made up as much as possible from those who are present or who attend pretty regularly. This very year a resolution was passed that the names of those who did not attend should not appear in the printed lists, and in this the Association was quite right. As to the botanists being insufficiently represented, we must say that if it is so it is the fault of themselves and of no one else. They make no effort as a body to hold a high station in the Association, and they have no right to complain of the consequences.]

The Mistletoe.—I placed a berry upon an Apple tree in my garden about 16 years ago ; for the first seven years the Apple tree and Mistletoe continued to grow and flourish luxuriantly together, but after that time the Apple tree began to die away every year by a branch at a time ; still the Mistletoe looked fresh and green, but it made little progress in growth. Last year I cut the only remaining branch off the Apple tree, leaving the Mistletoe to itself. [Since then the Mistletoe has died, proving that it cannot keep alive a tree on which it grows after the latter has been deprived of its branches, nor yet live upon it itself after the head of the tree is killed. The head of the Apple tree was above the Mistletoe ; it was a standard grafted on the Paradise stock. Do you think that the failure was owing to the Apple being grafted on the Paradise stock, and consequently not growing fast enough for the Mistletoe ? *R. Humphreys, Dunchurch Road, Rugby.* [The Mistletoe died because it had no more food to exist upon.]

Fuchsia spectabilis. — Excepting two plants, which are in my possession, I have not seen or heard of a healthy-growing plant of this Fuchsia in this neighbourhood. In March last I purchased mine of a nurseryman ; they were then very small plants in very small pots. At the beginning of April I shifted them into pots about 4 inches across. The mould I used was sandy peat, loam, and some leaf-mould. I then filled two larger sized pots with moss, in which I made a space for the pots in which were the two Fuchsias. I then placed them at the front of my greenhouse, always keeping the moss damp, so that but little watering was necessary. Their growth was rapid, and they continued perfectly healthy. At the beginning of July, having examined the roots and finding the pots well filled with them, particularly at the bottom, I placed them in pots 6 inches across, using in the compost more rich loam than at first. I then placed them in moss as before, and at the front of my greenhouse, where they have continued to this present time in a healthy state. They are now about a foot high, and have fine dark leaves more than 5 inches in length, exclusive of the stalk, and upwards of 2 inches in width. As the season is advancing, and as there is no present appearance of their blooming, I am afraid they will not do so this year, which will be a disappointment to me. From one of the plants I have taken four cuttings, which have been easily struck, and there are two other side shoots on the same. *W. W., Chichester.*

Planting Potatoes.—Amongst the million and more of suggestions which have been thrust upon your notice about the Potato, allow me to add mine for planting, which I have some faith in, from results. The Potatoes intended for seed must remain in the ground during the whole winter, or till such time as planting is to be done. The haulm must be removed when withering, or earlier, if showing any symptoms of blight, and the ridges well earthed up. When sowing is intended to be commenced, prepare the plot a fortnight before-hand, and as you proceed with the digging, sprinkle common salt over the surface lightly. The Potatoes must not be put in till 10 days after the application of the salt, then raise the Potatoes, and put them in immediately—the less time they are exposed to the air the better. I imagine that the sound Potato only will survive the winter, that it is far safer undisturbed in the ground than if taken up at the usual season, that the earth interposed between the tubers protects the sound from the unsound ones, should there be any, and that the seed is more naturally matured, and more likely, thus managed, to produce a sound crop. I have taken the idea about the strewing the salt on the earth 10 days before planting from —Wythe Esq., of Middleton, whose satisfactory and well carried-out experiments I had the opportunity to witness. I must add that the ground must be well drained, unmanured, and have a good aspect ; that the ridges should be at least 3 feet apart, and that the earth should be frequently and freely hoed during the growing season. All the superfluous rank-growing haulm should be cut away from time to time, so that the ground may receive the full influences of light and air. Whether the following whim is worth the ink that writes it, you can best determine. Shortly before the disease usually developes itself, let a strip 4 or 5 inches wide of common chalk or carbonate of lime be strewed between the ridges cleared of weeds. On a calm moist day, water this with sulphuric acid 20 times diluted. The carbonic acid evolved will, from its density or greater specific gravity, keep down, and slowly circulate through the haulm and leaves, to the destruction perhaps of some of the noxious insects, and noxious growths of small vitality, which may affect the crop, as well as to an improved condition of the plant, through the absorption and assimilation of this matter making gas. The gypsum formed by this procedure will be a fixer of the ammonia said to be both in the air and rain, &c. *T. J.*

The Cuckoo.—I have been somewhat amused, and not a little surprised, at the observations of some of your correspondents, upon the change of the note of the cuckoo, particularly at those of the intelligent and observant Mr. Bree, of Stowmarket, who says that he has not remarked this change till within these few years. A native of Ipswich, only some dozen miles from Stowmarket, as a boy upwards of 50 years ago, I was accustomed to observe, and now well remember, not only this change of note, but likewise the doggrel verses upon the subject in every ploughboy's mouth, which I send in all their native uneducated Suffolk abhorrence of the sibilant letter *s*, at the end of a verb, which, consequently, when the noun is singular, makes the rest plural :

> In April the cuckoo show his bill,
> In May he sing night and day ;
> In June he change his tune,
> In July away he fly,
> But in August away he must.

But I should have scarcely thus have troubled you, but for the purpose of introducing the following observations upon the economy of this bird :—I have a copy of "Stillingfleet's Tracts," which belonged to Mr. Teesdale, the well-known naturalist, in honour of whom the Iberis, formerly nudicaulis, is now Teesdalia. In this copy there are many brief marginal notes, and now and then a slip of paper appended where the margin did not suffice. At page 94, in the "Essay on the Economy of Nature," by Isaac J. Biberg, it is stated that "the cuckoo lays its eggs in the nest of other (?) small birds, generally the wagtail, or hedge sparrow, and leaves the incubation and preservation of the young to them." Upon which Stillingfleet in his notes remarks, that "Linnæus (quere Biberg) seems to have mistaken the white-throat for the hedge sparrow," and that this custom of the cuckoo is so extraordinary, and out of the common course of nature, that it would not be credible, were it not for the testimony of the most knowing and curious natural historians, such as Ray, Willughby, Gesner, Aldrovandus, Aristotle, and others. Mr. Teesdale's note upon this passage is this, "I have my doubts about the cuckoo's leaving the incubation of her eggs to a small bird, from the following circumstance : in the year 1765 I shot a cuckoo as she was rising from a bunch of Furze, and upon examining the place I found two eggs very warm, and with young ones in them. I am pretty certain she was sitting upon her own eggs. *R. T.*" In the hope

that these observations from so distinguished a naturalist may be acceptable, and induce more accurate investigation into this interesting subject, I have forwarded them to you, more especially as I have always thought it unlikely that such small birds as those to which the maternity is generally attributed, should be able to impart warmth enough to eggs so much larger than their own, as to be able to bring them to maturity. *J. B. K. L., Lynn.*——The altered note of the cuckoo has been noticed so long and so commonly, as to have formed the subject matter of one of those old rhymes of which every school-boy in my time knew a dozen or more. I have a note of this somewhere in my possession (which I cannot however find), and which runs somewhat thus :

When first the cuckow cometh, he doth sing
"Kooke-kow," "kooke-kow," to every kooke a kow,
But long summer days a change do bring,
'Tis the "kook-kook—kook-kow," many a kooke, scarce ever a kow.

I have myself noticed the change as long as I can remember, as well as the guttural sound noticed by Mr. Bree. This district, North Riding moorlands, abounds with cuckoos, there being, I should think, half-a-dozen for one as compared with the other parts of the country (in Essex, Cambridgeshire, Suffolk, Herefordshire, Berwickshire, and Yorkshire) with which I am by residence acquainted. From frequent observation I conclude that the change in the note of this bird is analogous to the changes which may be noticed by a close observer in the notes of almost every bird in the breeding season and its various epochs. Some birds, the nightingale to wit, become totally silent when the young brood is hatched. The note, at all events one of the notes, of the nuthatch is entirely different after "Valentine's-day," and till the breeding season is past, from those it uses at other periods ; and the same is true of the rook and other birds, which any one may notice for himself. As far as my observations go, you may always meet with young cuckoos soon after the period at which the senior cuckoos begin to use their altered calls. And I doubt not that, though they are innocent of incubation, they yet follow the rule of other birds as to their vocal exercises. I do not know if it has been generally noticed that after the period of the altered note comes a period of total silence, lasting some few weeks before they leave the country. The usual cry "Cuckoo" is always accompanied by much motion of the tail, which is elevated at the moment of utterance ; the altered note "Cuck-cuck-cuckoo," is very frequently, I might say much the most frequently here, uttered on the wing or just after settling on a tree, in which case the guttural sound always follows. *J. C. Atkinson, Danby, near Grosmont, York.*——Some of your correspondents seem to think that the cuckoo has sung this summer as it never sung before. The fact is, that when the male bird is away from the female his note is simply "cuckoo ;" but when he is toying with her it becomes rapid, and broken into monosyllables, such as your correspondents describe, and a hissing, shuffling noise at the same time frequently proceeds from one or both of the birds. But let me draw the attention of your readers to the note of the female cuckoo, one of the sweetest of sweet rural sounds—rapid, but soft and melodious, and so very different from that of the male that it is very generally supposed to proceed from one of our woodpeckers. Cuckoos abound here in their season. Soon after the middle of July their song suddenly ceases, and they all leave us, with the exception of a very few young birds then still unfledged, one of which I saw on the 19th of this month (August) followed by its foster parents. How marvellous the instinct which will ere long lead this young bird to a far distant land ! *A South Bucks Yeoman.*—[We think the Cuckoo question has now been carried *far enough.*]

Moor Park Apricots.—In the nursery of Messrs. Jessop, of Cheltenham, is a standard Moor Park Apricot, bearing at least 30 dozen fruit in fine condition. The tree stands isolated, and, as far as I can see, there is no peculiarity either in the soil or situation. *A Constant Reader, Gloucester, Aug.* 29.

Mignonette, from which bees are excluded, and the production of seed thereby prevented, blooms much more freely, for a much longer period, and with a more continuous odour, than when bees have access to it. *C.*

In and Out-door Grapes.—Last spring I introduced a branch of a white Sweetwater Vine into a frame on a slight hotbed, as soon as the bunches of Grapes were formed ; they grew rapidly and swelled very much, faster than the bunches on the same Vine on the open wall, but now the latter are double their size. Those in the bed are stunted the size of Peas, and now clear and ripe, while those on the wall are still quite green and swelling, and very handsome bunches, but most likely they will never properly ripen. Can you assign a reason for the failure of those within the frame ? also, would it be of any use now to introduce a fresh branch from the wall into the frame, if I can manage it ? *Inquirer.* [Yes]

Shrubs to withstand the Sea Breeze.—Would any of your readers kindly favour me with a good list of flowering shrubs that would not suffer from the sea breeze ? Hydrangeas are the only things that thrive with me in any amount of exposure. A gale laden with spray, which blackens everything around, leaves them unharmed ; but one becomes tired of these huge flowering masses. Aspect seems to affect their colour. A border of precisely the same soil, part of which is shaded from the afternoon sun, produces blue flowers ; while, where it is exposed to the wet, they are pink ; and just at the bend, one side of the shrub has pink and the other blue flowers, with a curious mixture of lilac. Any flowering shrubs that would endure an occasional gale would be invaluable ; the climate is otherwise excessively mild. Abutilon striatum has lived on a S E. wall for four or five years without any protection, and is covered with its graceful flowers ; on the same wall there is a flowering Myrtle 12 feet high ; in this, on a slight projection of the terrace, a chaffinch built its nest. Fuchsias also grow to any size the wall will permit. One of the old kind (rivularis ?) covers a rather exposed turret 17 feet high ; this is hardier than any other kind. The sweet-scented Verbena also grows to a great size ; while the common Laurel by its side perishes, and will only grow when sheltered from the wet. Shrubs not requiring a wall would be most useful. *F. A. P., St. Bride's Hill, Haverfordwest, Pembrokeshire.*—[We hope some one will give our correspondent the benefit of his experience, and that he will tell us what Fuchsia rivularis is.]

Societies.

Meeting at Worton Cottage, *Aug.* 28.—Messrs. Chater and Son, of Haverhill, Suffolk, produced the following varieties of Hollyhocks in fine condition : a single bloom of the Queen of England, noticed in our report of last week ; Beauty of Haverhill, silvery lilac, of fine form and size ; Fairy, externally a light-coloured variety, the ground colour of a darker shade ; Sulphurea Perfecta, a new yellow ; Obscura Aurantia (Rivers), a very fine flower, salmon and orange combined ; Black Prince, Eclipse, a very compact flower, veined maroon ; Magnus, Rubida, and Noblissima. These were the only flowers present, with the exception of some Orchids, and a nice display of cut Verbenas and seedling Antirrhinums, from the garden at Worton Cottage. As next Wednesday will be the exhibition-day of the Royal South London Floricultural Society, there will be no meeting here, and the season may be considered as virtually closed In the winter months, when matter for our columns is less pressing, we may perhaps have a few words to say upon these pleasant opportunities, which we can look back upon with unmixed satisfaction.

Royal Chelsea Dahlia, *August* 20.—This, the opening Exhibition of the season, proved very satisfactory.—Class I., open to all growers, 24 varieties : 1st prize, a Silver Cup, value 5 guineas, presented by T. B. Simpson, Esq., was awarded to Mr. Turner, Royal Nursery, Slough, for the following : Fearless, Earl of Clarendon, Sir F. Bathurst, Gem, Toison d'Or, Negro, Queen of Lilacs, Duke of Wellington, Thames Bank Hero, Mr. Seldon, Seraph, Scarlet Eclipse, Marchioness of Cornwallis, Shylock, Queen of the Isles, Richard Cobden, Nouppariel, Mrs. Seldon, Black Prince, Duke of Cambridge Frederick Jerome, Yellow Standard, Louis-Philippe, and Andromeda ; 2d, to Mr. Keynes, Salisbury, for Hon. Sidney Herbert, Cobden, Princess Louisa, Gaiety, Cleopatra, Capt. Warner, Miss Vyse, Purple Standard, Shylock, Magnificent, Sir F. Bathurst, Mr. Seldon, Lord Mayor, Snowflake, Duke of Cambridge, Essex Triumph, Privateer, Duke of Wellington, Yellow Standard, Sarah, Toison d'Or, Queen of Primroses, M. Gouberts, and Buffalo Girl —Class II., private growers, 12 blooms, a Silver Cup, value 5 guineas, presented by T. B Simpson, Esq., was awarded to Mr. Robinson, Pimlico, for Purple Standard, General Negrier, Queen of Lilacs, Duke of Wellington, Lady St. Maur, Richard Cobden, Scarlet Gem, Sir F. Bathurst, Mr. Seldon, Shylock, Princess Radziville, and Duchess ; 2d, to Mr. Black, for Mr. Seldon, Earl of Clarendon, Marchioness of Cornwallis, Thames Bank Hero, Shylock, Fearless, Richard Cobden, Magnificent, Elizabeth, Sir F. Bathurst, Queen of the Isles, Yellow Standard.—Class III , open to all growers, 12 fancy varieties : 1st prize to Mr. Keynes, for Flying Dutchman, Striata perfecta, Conspicua, Comus, Jeannette, La Rosiere, Candidate, Keepsake, Miss Blackmore, Comte de Flandre, Gasparine furstin Reuss, and Madame Basseville ; 2d, to Mr. Turner, for Striata perfecta, Conspicua, Lady Grenville, Elizabeth, Master G. Clayton, Comte de Flandre, Madame Wachy, Brunette, Jenny Lind, Delicata, Henrick von Gagern, and Princess Louisa —Class IV., private growers, 6 fancy varieties : 1st prize to J. Edwards, Esq., Holloway, for Jeannette, Flying Dutchman, Elizabeth, Princess Helena, Highland Chief, and Lady Grenville ; 2d, to Mr. Pope, Chelsea, for Elizabeth, Madame Wachy, Floral Beauty, Postsecretaire Hane, Jenny Lind, and Adolph Dubras.—Class V., private growers only, 6 blooms of new varieties, sold out for the first time in 1850 : equal 1st prize to J. Edwards, Esq., for Earl of Clarendon, Duke of Cambridge, Seraph, Snowflake, Sir F. Bathurst and Queen of the Isles ; 3d, to Mr. Robinson, for Sir F. Bathurst, Queen of Lilacs, Seraph, Earl of Clarendon. Beauty Supreme, and Queen of the Isles ; equal 1st prize to Mr. James, Stoke Newington, for Earl of Clarendon, Magnificent, Sir F. Bathurst, Premier, Beauty Supreme, and Queen of the Isles.—Class VI., private growers only, 6 blooms : 1st prize to Mr. Allen, Shacklewell, for Shylock, Mr. Seldon, Sir F. Bathurst, Capt. Warner, Duke of Wellington, and Fearless ; 2d, to Mr. Pope, for Mr. Seldon, Lady St. Maur, Purple Standard, Fearless, Richard Cobden, and Sir F. Bathurst. Extra prize for the best fancy seedling, not out, yellow tipped white, was awarded to J. Edwards, Esq., for Edwards' Mrs. Hansard, a noble variety, full, and of good form ; three blooms were exhibited. Seedlings.—These were neither very numerous nor very good, no doubt owing to the earliness of the exhibition. First class certificates were awarded to Mr. Keynes for Summit of Perfection (purple), and Hon. S. Herbert (orange and scarlet mottled) ; to Mr. Bragg, for Admiral (pale lilac) ; to Mr. Greathurst, for Lady Franklin ; and to Mr. Edwards, for Mrs. Hansard, yellow tipped white.

Reviews.

Practical Ventilation. By Robert Scott Burn. Blackwoods, 12mo, pp. 208.

This little work consists of five chapters, devoted respectively to, 1st, a few remarks on the necessity and importance of ventilation ; 2d, a short account of its principles, and their application to the ventilation of public buildings ; 3d, the ventilation of private houses ; 4th, that of agricultural edifices ; and 5th, the heating of buildings generally. A recapitulation and an appendix on the ventilation of ships are added. The author expresses a decided opinion that, in the great majority of cases, a very effective ventilation may be obtained, both cheaply and easily, by a proper attention to the laws regulating the motions of heated air, without any of that cumbrous machinery so often recommended if not employed.

The great principle on which every system of ventilation turns is thus laid down. "In ventilating buildings, two things should be borne in mind ; and as upon the proper attention to these depends the success of the plan, particular attention should be taken to see them carried into effect. These are the supply of the interior with fresh air, and the withdrawing it when vitiated. And here we would request attention to the fact, of which the evidence of all experience goes to prove the truth, "that *no foul air can by any possibility be extracted from the interior of any building, however well arranged the means to ensure its exit may be, unless an ample supply of pure air is admitted.* It is the force of air entering, that causes the vitiated air to be expelled. It is necessarily impossible to have ventilation without a movement of air."

Our readers will do well to remember this. How often do we find horticultural and agricultural buildings, which are said to be ventilated, provided either with one opening somewhere near the top, through which the foul air is expected to pass, whilst the lower part is kept carefully closed, or with an opening near the bottom, made for the entry of fresh air, whilst no means are provided for getting rid of the foul. The proper methods of obtaining these two ends the author professes to point out. His explanations are, as he himself tells us, intended for practical men, that is, for those conversant with the art of building ; this has led him into the mistake of being too short for other people, and of rendering his observations less intelligible and clear than he otherwise might have made them. At the same time many valuable hints may be obtained by the uninitiated, and especially from the fifth chapter, which contains some useful information relating to the construction of fireplaces, and the remedies for smoky chimneys. The appendix on the ventilation of ships is well worthy of perusal by those engaged either in building or in sailing in them.

Miscellaneous.

Common Flowers.—Had we not seen the remarkable collection of Messrs. Vilmorin-Andrieux and Co., we should not have believed that so fine an effect could have been produced by annuals grown, nearly all of them, in the open air. What beautiful effects might be had by means of these common plants, many of which are of our climate, if we could only grow and arrange them with the skill of these gentlemen ! Some of the vases in this collection would most certainly not suffer though compared with the most magnificent and attractive objects in the exhibition. The splendid tufts of Schizanthus Grahami and rubens will well bear to be compared with any Pelargonium, even with the splendid Reine des Français which did M. Chauviére such great credit. We appeal to all good judges or men of taste who saw the exhibition, to say whether we are not correct. What could be more graceful than the vases of Rhodanthe Manglesii, Eucharidium grandiflorum, Viscaria oculata, of Clarkia, with its snow white flowers ? What more magnificent than the Snapdragon, with its long spikes streaked with yellow and purple, surpassing anything of the sort we ever saw before ? Messrs. Vilmorin-Andrieux and Co. have a long established reputation to maintain, and most assuredly it suffered nothing by their last exhibition. Had we more room we should be delighted to describe in detail the numerous species which the clever men in this establishment have placed in the first rank among ornamental plants ; we should tarry over the delicate clusters of Grasses grown in pots (Aira pulchella, Stipa pinuata, Briza maxima, Lagurus ovatus, &c.), whose airy, silky, or velvet panicles contrast so well with their hair like foliage ; we should speak of those pretty violet-coloured composites (Brachycome iberidifolia) ; of those Everlastings with their metallic carmine scales ; of those dwarf Wallflowers, with their remarkably strange colours given them by consummate skill ; but the small space that is left us must be devoted to other horticulturists. *Revue Horticole.*

Hollyhocks.—If I were not afraid of advancing a horticultural heresy, I should say that many amateurs prefer Hollyhocks to Dahlias. The Hollyhocks of Belgium and Germany had a great celebrity long before they appeared among us. The collections of the Prince of Salm Dyck, and of M. Van Houtte, of Ghent, have been much admired. In other places varieties have been obtained with leaves more or less lobed, more or less entire, more or less palmate, all with flowers large, full, or coloured differently from those of other plants, being sometimes of a more or less dark mahogany colour, at others of a delicate tint, and varying from the purest white to the darkest glossy black. Some progress has also been made in the cultivation of those plants by ourselves. Since 1830 M. Pelissier, jun., a gentleman of Prado, has cultivated Hollyhocks, and from the seeds of a pink variety has succeeded in obtaining plants with flowers of a delicate rose colour, and which, in consequence of the extreme delicacy of their tints, and regularity of form, may serve both to encourage perseverance and as a good type for seed. In the following year, from the seeds of pink flowers, he obtained a beautiful, brilliant, clear, sulphur-coloured specimen, perfect in every respect. It is from the seeds of those two plants that he has obtained all the other beautiful and remarkable varieties which he now possesses, after a lapse of 10 years from his first attempts. As a

general rule, M. Pelissier prefers flowers with six exterior petals, with entire edges, well open, well set out, of a middling size, of a pure, clean, brilliant colour, and forming a perfect Anemone. Seeds sown in the spring and in unwatered ground, never flower till the second year. Experience has shown that if the seeds are sown in September, and in earth which is kept fresh, flowers may be obtained in June or July following, which are in no way inferior to those of spring-sown seeds. M. Pelissier follows the following plan of procedure. The seeds, which are taken as soon as they are ripe, from good specimens, are sown in September, in a border a foot and a half deep, and composed of good coarsely sifted garden earth, mixed with well worked soil. The seeds, if they are covered lightly with leaf-mould, and the soil is kept fresh, begin to swell at the end of a week; they require little care till spring, as they are not hurt by frost. In the spring the ground must be repricked, occasionally hoed, and frequently watered. As the flowers expand M. Pelissier removes whatever is not conformable to the type he has chosen, or is not of a marked colour, and like a perfect Anemone. It is by doing this every year that he has obtained 20 remarkable varieties, the names and characteristics of which have been kindly furnished by him, and are given below. 1. Souvenir de Malmaison, delicate rose, flower very full; perfection. 2. Géant de Batailles, red, flower very full. 3 Vestale, fine pure white, flower very full. 4. Anais, rose, flower very full; perfection. 5. Chromatella, dark yellow, flower very full. 6. Jeune Euphémie, clear red, flower beautiful, full; perfection. 7. Reine Victoria, cinnamon coloured, shaded, flower very full. 8. Grand Peking, nankeen-coloured, flower very full. 9. Amarante, dark red, flower very full. 10. Isabelle, dark red, flower very full. 11. Grand Colbert, dark rose, streaked, flower full, very perfect. 12. Marie Gabrielle, fleshy white, flower full; beautiful. 13. Matilde, clear cherry, flower very full. 14. Solfaterre, very clear yellow, flower very full. 15. Boule de Neige, beautiful white, flower well rounded, full. 16. Ophirie, yellow with a tint of pink, flower very full. 17. Arlequin, clear, approaching to dark violet, spotted with white. 18. Desprez, white, middle yellow. 19. Proserpine, very dark red, flower very full. 20. Pluton, black, flower very full. *Revue Horticole.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Stove plants which flower upon the young wood may with propriety be shifted now, as they will thereby be much invigorated; and the blossoms also will give evidence of the advantage, by their superiority in size and colour. Those, on the contrary, which flower upon the ripened wood, must be gradually encouraged to go to rest, as the days decrease in light. We would not pot any plants when they are very near their flowering season. Poinsettias which do not flower until January, we would encourage by repotting now, and by supplying them freely with liquid manure; as the floral leaves will be double the size that they would be if less liberally treated. We mention this as an instance of our meaning, as it is impossible to enter more fully into specific directions within the limits of the Calendar. Amaryllids in pots, as they show signs of ripening, should be gradually dried off. The Belladona Lilies in front of the houses, and at the foot of sunny walls, will be benefited by soakings of rich water. The Japan Lilies now coming into flower should have every possible encouragement by liberal waterings of clear rich water, and afford them a slight shade while in bloom.

FORCING DEPARTMENT.

Pineries.—The plants which have been recently potted, or shifted into new soil, are now growing vigorously. This state of things should be encouraged by a liberal temperature, but accompanied at all times by sufficient ventilation to prevent undue elongation of the leaves, and to mature their tissue while the sunlight is powerful enough for this purpose. A less humid atmosphere should be supplied generally, and especially to those intended for fruiting early next spring, as it is very important that they should acquire a strong sturdy habit, and that the accumulation and elaboration of sap be encouraged, rather than the increase of the size of the plant. Assist the swelling fruit with liquid manure, but admit abundance of air, for the sake of the flavour, and to prevent the crowns growing too luxuriantly.

Vineries.—Pay every attention to the preservation of ripe Grapes from the effects of damp, by avoiding the spilling of water about the houses, and by admitting a free current of air in all favourable weather, and accompanied by a little fire during rain or fogs. These houses should now, if possible, be freed entirely from plants in pots, or if any are allowed to remain they should be of kinds requiring little or no water, such as bulbs and other stove plants, which require a dry, cool treatment to lead them to repose. From this time the points of all growing shoots should be stopped, as the leaves produced after this time take from the stored-up energy, without ripening sufficiently early to benefit the Vines in return. Care, however, must be taken not to stop too closely the lateral shoots of Vines which are still growing vigorously, as they are liable in such cases to burst the buds too near the base of the shoots. As the wasps are now becoming troublesome, their ingress should be prevented, by fixing some thin bunting over the moveable sashes. Haythorn's hexagon or gauze net is the best material we are acquainted with for this purpose, as it effectually excludes wasps and flies, while the lightness of the fabric causes it scarcely to obstruct the light and air.

FLOWER GARDEN AND SHRUBBERIES.

Before the season is further advanced, every gardener should calculate, as nearly as may be, whether the extent of his framing conveniences will be sufficient to afford shelter during winter to his stock of established half-hardy plants, as well as to those he is now propagating. If his room is deficient, he must either restrict autumnal propagation within certain limits, or prepare additional pits without further loss of time. Brick pits are of course the most durable, and although expensive in the first outlay, are cheapest in the end. A very common make-shift pit is built of turves, which lasts several seasons and is very warm, but in appearance rather untidy. A sowing of hardy annuals may now be made for flowering early in spring; these will flower as soon as the earlier plants raised in frames next year, and as frame room in spring is generally scarce, it is worth while to economise it; they may be sown in the reserve garden, and afterwards transplanted.

FLORISTS' FLOWERS.

The exhibitions for Dahlias will now be in their zenith, and to procure fine blooms during the past stormy weather will have tested the skill and patience of many an amateur. Early flowers, from which it may be desirable to save seed, should have attention, and as they wither, the decaying florets should be extracted. Seedlings, especially weak late blooming ones, that give any evidence of good quality, though they may not be quite up to the mark in every respect, should be taken care of, to be tried again, as high cultivation another season may cause a more favourable development of their good qualities.—Hollyhocks are now attracting much attention as a florist's flower, and great improvement has been made in them. Save seed from the best. We adopt the plan of removing the upper part of the spike, leaving six or eight of the early blooms. When the plant throws four or five stems, and propagation of the variety is an object, one or more of the spikes of flowers may be sacrificed, in order that the seeds in the axils of the leaves may be more fully developed; the stem may be split and cut in lengths, shortening them on each side of the shoots, and place them under a hand-glass, taking care that the small portion retained is covered with soil, leaving the point of the bud exposed. This plan we have often successfully practised, and recommend it to our readers.

KITCHEN GARDEN.

Late crops of Turnip, Parsley, Spinach, &c., should be thinned before the plants begin to intrude upon each other. The earliest sowing of Cabbage-lettuce may be planted on a border with an east or west aspect, reserving the most favourable situations on the south borders for Endive and the later sowings of Cabbage-lettuce. Two sowings more of the latter should be made at intervals of 10 days. A main sowing should be made immediately of Early Asiatic Cauliflowers for planting under handlights, and preserving during winter in frames; and, at the same time, a little Early York Cabbage should be sown for an early spring crop, and a sowing of Red Dutch Cabbage for main crop next. Transplant late sown Cabbages in rows 8 inches asunder every way; of these, three-fourths will be drawn in a young state, and used as Coleworts; the remainder will be left to produce heads. Endive, Lettuce, &c., should be transplanted as soon as the plants are large enough to be handled.

State of the Weather near London, for the week ending Aug. 29, 1850, as observed at the Horticultural Garden, Chiswick.

Notices to Correspondents.

Back Numbers of the Gardeners' Chronicle: The publisher begs to say that the following may be had. Any subscriber who will forward postage stamps equivalent to as many numbers as are required, will have them sent free by post. The volume for 1847, price 30*s.*, and volume for 1848, price 30*s.* 6*d.*, can still be had. The volume for 1849 is now ready, price 30*s.* The volumes of former years are out of print.

1841—1, 8, 13, 14, 15, 16, 17, 18, 20, 22, 23, 24, 26, 27, 28, 29, 30, 31, 32, 34, 45, 46, 47, 48, 51.

1842—4, 6, 8, 11, 16, 18, 20, 31, 32, 42, 45, 50, 51, 52.

1843—13, 16, 17, 18, 20, 22, 23, 24, 25, 26, 27, 28, 29, 30, 31, 32, 33, 34, 36, 37, 40, 41, 42, 48, 49, 50, 52.

1844—All except 33, 36, 37, 46, 50.

1845—1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 13, 14, 15, 17, 18, 19, 20, 21, 23, 24, 25, 27, 28, 31, 33, 39, 40, 41, 42, 43, 44, 45, 50, 51, 52.

1846—4, 5, 6, 10, 11, 12, 13, 14, 15, 16, 17, 18, 20, 22, 23, 24, 26, 27, 42, 43, 46, 48, 49.

1847—1, 2, 3, 4, 5, 8, 11, 13, 14, 16, 19, 20, 21, 22, 27, 28, 32, 33, 36, 37, 41, 42, 43, 44, 45, 46, 47, 48, 51, 52.

1848—1, 2, 3, 4, 5, 6, 7, 8, 9, 10, 11, 12, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28, 30, 33, 34, 36, 37, 39, 40, 41, 44, 45, 47, 48, 51, 52, 53.

1849—All except 46, 47, 48, 49, 52.

Double Fuchsias: *W W.* They are not at all uncommon.*

Filberts: *Kernel Nutt.* In order to keep these for considerable time, they should be thoroughly dried, packed in dry casks or new flower-pots, with a slight sprinkling of salt, to prevent mouldiness, and then placed in a dry cool situation. The husks should be allowed to remain on them ‡

Fruit-trees: *Westerly Aspect.* As your aspect proves not suitable for Peaches, Nectarines, Apricots, nor even for Plums, better occupy it with the hardier sorts of Pears, such as Knight's Monarch, Suffolk Thorn, Thompson's, Marie Louise, Broom Park, and Eyewood. ‖

Indian-Rubber Tree: *Rus in Urbe.* Do not use a galvanised iron box; far better have a slate box. If you increase the size of the latter, you will increase the tree also, which, we suspect, will be inconvenient. So long as it remains in health, let it remain as it is; if it becomes unhealthy, give it a little guano-water.

Insects: *F A P.* We are obliged to you for the additional Rose leaves. We trust we shall be able to rear the insects inclosed. An analogous case may sometimes be met with at the tips of sprigs of Quickset hedges. *W.—F S.* The plants recently purchased are sadly infested with the mealy bug, and the tradesman who supplied them in such a state ought to be exposed. Spirits of wine is the best remedy. *W. — Y O.* The insects found on the Silver Fir are Lachnus pineti. Pray inform us of the locality where found. *W. —M J B.* We know no previous instance of the larvæ of Cecidomyiæ infesting the interior of Pea pods. Is the loose internal texture, within which some of the larvæ are buried, a fungus or a diseased state of the pod? *W.—W H C.* The insects on the Pea leaves are the slimy grubs of a saw-fly (Selandria æthiops). Syringing with lime water, or powdering the leaves with lime, is the best remedy. *W.*

Ivy: *A D O.* Cut it off above the ground and it will die, or set it on fire, if it is not dangerous to do so. Ferns may be removed if you dig up the very deep roots; what are called roots are nothing but underground stems.

Melons: *X Y Z.* It is not uncommon for the same plants to ripen two crops in one season. Under your circumstances four fruit to each plant will be sufficient ‡

Music: *Hannah.* We would willingly oblige you, but we cannot find room for poetry. We quite agree with you about "silly riddles." It ought not to have been inserted. If you will again send us the question, with your address, we will insert the question, and transmit the answer if we get one. Editors never preserve papers; they are used at once, or are thrown aside and wasted.

Names of Fruits: *J G, Bath.* Your Apricot is not a variety of Moor-park; it is the Turkey. You will find that it has a sweet kernel, that of the Moor-park is bitter. You state that, unprotected, it bears every year a good crop, when others on each side of it fail, an additional proof that the Turkey is a sort worthy of more extensive cultivation.‖—*J G.* The Jargonelle.‖

Names of Plants: *Erzeroum.* 464, Heliotropium villosum; 72, Rindera, near canescens; 96, Rindera; 142, Cerinthe; 228, Cynoglossum; 527, Acroptilon Pieris; 197, Centaurea pulchella; 515, Centaurea, near macrocephala.—*G B.* Apparently a morsel of some Heliophila, near H. arabidoides.—*A Sub* Origanum Dictamnus and Gazania uniflora.—*H R K.* Phacelia tripinnatifida.—*R M.* 1, Polygonum Persicaria; 2, Euphrasia officinalis; 3, Erica cinerea; 4, Hieracium Pilosella.—*P P.* 5, Odontoglossum nævium; the rest next week.—*Cymro.* It is the male Buffalo-berry, Shepherdia argentea.—*S H.* 1, Genista pilosa; 2, Erica tetralix; 3, Scabiosa succisa; 4, Tormentilla reptans; 5, Salix fusca; 6, Betonica officinalis; 7, Agrostis canina; 8, indeterminable—all wretched specimens of the commonest plants.—*L N R.* 1, Epipactis latifolia; 2, Gentiana amarella.—*G Plew, Thornhill.* Symphytum asperrimum, and some starved Anthriscus indeterminable.—*P H Ransom.* It is not possible to name plants sent in such a state; they look like a piece of peat. Here are the names of a few: 1, Croton pictum; 3, Rivina humilis; 6, some Justicia; 5, Nierembergia filicaulis; 2, the white Daboecia vulgaris; 10, Aponsoa incisa? 7, Lycopodium denticulatum.—*Rusticus.* 1, Atriplex patula; 2, Chenopodium ficifolium; 3, Polygonum Persicaria.—*R W C H.* A very fine variety of Stanhopea insignis.—*A Constant Reader.* It is an Agrostis, and the species called A. stolonifera. No species of this genus is worth cultivating where better Grasses will thrive; but in wet heavy land they have their value, on account of the abundance of the herbage they afford.—*Cavanensis.* The plant used in a moorland district in Ireland as an emetic, a small quantity bruised in water for this purpose proving very effectual, is Lycopodium Selago. Its emetic qualities are well known.—*E Graham.* Aster Tripolium.

Onions: *Sub.* Sow in a sheltered situation, and transplant in spring.‡

Pine-apples: *D H, Bilston.* You will find the information you seek in our weekly "Calendar of Operations."‡

Planting: *Gallicus.* We should certainly plant Coniferous plants, as well as other evergreens, now. Our experiment with them last year was perfectly successful.

Potatoes: *J S S, Hinckley.* A fine Potato certainly; but we cannot judge of its value without the experience to be gained by growing it.—*Birkhurst.* We believe the best course to pursue, where they are undoubtedly blighted, is to mow the stems down, to put 3 or 4 inches of earth over the ground, to roll it down with a heavy roller, and to leave them in the ground till they are ripe.‡

Roses: *F A P.* You may thin out the wood of your Noisette and Boursault Roses, &c, in the manner you propose with advantage. They will be both neater in appearance and will flower better.‡

Scarlet Geraniums: *Sub.* They may be wintered in a dark place, but it must be dry and free from frost ‡

Misc: *Lady M.* Salvia Regla should be treated just like S. splendens. Your Fuchsia serratifolia should be in bloom now. The principal points to be attended to in its management are to prevent over-luxuriance, and to get its wood well ripened.‡

SEEDLING FLOWERS.

Calceolarias: *J P.* Novel in appearance, being all more or less striped with yellow, orange, and bright brown. A step in the right direction; but if we may judge from the partially shrivelled specimens sent, they all want improvement in shape.*

Dahlias: *T B.* A large finely-formed flower, of great depth, and having a compact centre. It is one of the largest flowers we have seen. It is, however, much of the same shade as Mrs. Seldon.*

Heliotrope: *S V.* A pretty variety in the way of Voltaireanum.*

Lilies: *Kent Florist.* A highly coloured variety of Lilium lancifolium speciosum.*

Petunia: *J T R.* Unexaminable, on account of the bruised condition in which it was received.*

QUEEN'S COLLEGE, CORK.

SCHOOLS OF ENGINEERING AND AGRICULTURE.

THE SESSION for 1850-51 will commence on the 15th of OCTOBER.

Prospectuses, with details of the several Courses of Lectures in connection with these Schools, the Fees payable, &c., may be obtained by application to the Registrar, or to the Professor of Engineering or Agriculture.

Boarding Houses, licensed by the President, have been established in Cork, where Students are received and comfortably provided for on moderate terms, and their religious and moral conduct watched over by the Deans of Residences.

By order of the President,

Aug. 31. FRANCIS ALBANI, Registrar.

BURBIDGE AND HEALY'S COOKING APPARATUS, combining Sylvester's Patents.—This cooking apparatus possesses greater general advantages than any yet submitted to the public, both as regards strength of material and workmanship; in fact, the laws of heat are so applied as to produce the greatest effect with the least consumption of fuel, without destruction to the apparatus. B. and H. can safely recommend it, from experience, as unquestionably superior to anything of the kind hitherto made. May be seen in daily use at the Craven Hotel, Craven-street, Strand; Stevens' Hotel, Bond-street; Greenwich Hospital; University College Hospital; and is in use by upwards of 200 private families, and at the Manufactory, 130, Fleet-street, London. A prospectus can be forwarded upon application, detailing particulars and price.

MANURES.—The following Manures are manufactured at Mr. LAWES's Factory, Deptford Creek:

Corn and Grass Manure, per ton	...	...	£10 0 0
Clover Manure, do.	...	...	11 0 0
Turnip Manure, do.	...	...	7 0 0
Superphosphate of Lime	...	...	7 0 0
Sulphuric Acid and Coprolites	...	...	5 0 0

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 15*s.* per ton; and for 5 tons or more, 9*l.* 10*s.* per ton, in dock. Sulphate of Ammonia, &c.

THE LONDON MANURE COMPANY beg to offer as under:

LONDON MANURE COMPANY'S WHEAT MANURE FOR AUTUMN SOWING.

CONCENTRATED URATE. SUPERPHOSPHATE OF LIME. PERUVIAN GUANO. SULPHATE OF AMMONIA. TURKEY AND AGRICULTURAL SALT, GYPSUM, and every artificial Manure; also a constant supply of English and Foreign LINSEED CAKE of the best quality.

The London Manure Company will guarantee the Guano they supply to be free from the slightest adulteration.

Bridge-street, Blackfriars. EDWARD PURSER, Secretary.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

E. DENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses, when completed charged, from 1*s.* 3*d.* to 1*s.* 6*d.* per superficial foot, according to size and quantity; on one principle the roof is formed without wood or putty, and on another principle with wood rafters, and the glass put in with putty. Patent Sashes, requiring no paint, from 7*d.* to 9*d.* per foot. HEATING BY HOT WATER.

HOW TO KEEP A HORSE FOR LESS THAN ONE SHILLING PER DAY.

"Do you bruise the Oats you give your horses?" "No."

"Then you lose one bushel out of every three, and your cattle do not half so well."

MARY WEDLAKE AND CO.'S OAT-BRUISING MILLS. Superior Chaff Engines, simple in construction, doing from 50 to 500 bushels daily, and more. Almost all brewers and coachmasters in London use these implements.

118, Fenchurch-street, London. A pamphlet on the above, by sending 12 postage stamps. Chaff-cutters, Linseed, Bean, and Malt Mills.

CHEAP AND DURABLE ROOFING.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

F. M'NEILL AND CO., of Lamb's-buildings, Bunhill-row, London, the Manufacturers and only Patentees of THE ASPHALTED FELT FOR ROOFING Houses, Farm Buildings, Shedding, Workshops, and for Garden purposes, to protect Plants from Frost.

At the Great National Agricultural Shows, it is this Felt which has been exhibited and obtained TWO SILVER MEDAL PRIZES, and is the Felt SOLELY patronised and adopted by

HER MAJESTY'S WOODS AND FORESTS,
HONOURABLE BOARD OF ORDNANCE,
HONOURABLE EAST INDIA COMPANY,
HONOURABLE COMMISSIONERS OF CUSTOMS,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANIC GARDENS, REGENT'S PARK,

And on the Estates of the Dukes of Sutherland, Norfolk, Rutland, Newcastle, Northumberland, Buccleuch (at Richmond), the late Earl Spencer, and most of the Nobility and Gentry, and at the ROYAL AGRICULTURAL SOCIETY'S HOUSE, Hanover-square.

It is half the price of any other description of Roofing, and effects a great saving of Timber in the construction of Roofs. Made to any length by 32 inches wide.

PRICE ONE PENNY PER SQUARE FOOT.

*** Samples, with Directions for its Use, and Testimonials of seven years' experience, with references to Noblemen, Gentlemen, Architects, and Builders, sent free to any part of the town or country, and orders by post executed.

☞ The Public is cautioned that the only Works in London or Great Britain where the above Roofing is made, are

F. M'NEILL AND CO.'S

Patent Felt Manufactory, Lamb's-buildings, Bunhill-row, London, where roofs covered with the Felt may be seen.

The new Vice-Chancellor's Courts, at the entrance to Westminster Hall, were roofed with F. M'NEILL and Co.'s Felt about two years since, under the Surveyorship of Chas. Barry, Esq., R.A. Her Majesty's Commissioners of Woods and Forests are so satisfied with the result that they have ordered the Committee Rooms at the Houses of Parliament to be roofed with their Felt. Quantity altogether used, 24,000 feet.

NOTE.—Consumers sending direct to the Factory can be supplied in lengths best suited to their Roofs, so that they pay for no more than they require.

Every information afforded on the construction of Roofs, or any proposed particular application of the Felt.

PERUVIAN GUANO.—As Agents of the Peruvian Government for the importation and sale of this valuable MANURE, we think it right, for the protection of consumers and respectable dealers, to apprise them that the adulteration of the article is still extensively practised, and to recommend them to apply either to ourselves, to our agents, Messrs. GIBBS, BRIGHT, and Co., of Liverpool and Bristol, or to dealers of established character, in whose honesty and fair dealing they can place implicit confidence. ANTONY GIBBS and SONS.

STEPHENSON AND CO., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

The Agricultural Gazette.

SATURDAY, AUGUST 31, 1850.

MEETINGS FOR THE FOLLOWING WEEK

THURSDAY, Sept. 5—Agricultural Imp. Society of Ireland.

IN adjoining pages, REPORTS OF THE CROPS will be found from most of the counties in England, Scotland, and Ireland. We regret to see from them that the Wheat crop through most of the southern and midland counties of England, and generally through Ireland, has been very seriously injured by mildew, so that a return much under the average will be the general experience in our principal Wheat-growing districts: and in the North, since these returns have been received, very great injury, as appears from the following communication from Mr. GREY of Dilston, has been done by the wind.

"*Dilston, Newcastle-on-Tyne, Aug.* 26.—Since the time that I answered your circular, enquiring as to the state of the crops and probable produce in this part of the country, I think it right to inform you that the opinion I then gave has been greatly altered by the effects of the most disastrous wind that has ever occurred in the memory of the oldest inhabitants. It began to blow violently on the afternoon of the 18th, and continued till noon of the 20th. A great breadth of grain was ripe, but little had been cut, owing to the showery state of the weather. The result is most calamitous, especially in the north part of Northumberland, and the counties on the other side of the border. In some situations farmers are cutting the straw for thatching hay stacks and other purposes without threshing it. As far as an opinion can be formed, I think it likely that one-fourth of the crop in the district I have named has been wasted, and that very great loss has been sustained over a great extent of country, though in a less degree This must be considered as a great public calamity, and one which farmers were never less able to overcome than at present. *John Grey.*"

Excepting the extent to which the injury here estimated so highly may have been general, the crop of Wheat and of other grain in the north seems to be good. Oats, generally, and especially in Ireland, are a great crop. The returns regarding the Barley crop are various, agreeing in one thing, however, that its *extent* is not so great as in past years.

Green crops are generally good; Turnips being, however, in some instances affected with the "Finger and toe" disease. Potatoes are almost universally affected with the blight, which, however, at the date of these reports, especially in Ireland, seem not yet to have seriously affected the tubers. The districts where it has proved most destructive lie along the south coast of England. In proof, nevertheless, of its activity, we have, since the returns to our circular, in many instances received subsequent reports altering the estimate originally made of the crop, and in every case referring to the rapid strides which the disease appeared to be making.

IN a former Number we referred to the general LAND DRAINAGE AND IMPROVEMENT COMPANY which has been recently formed under an Act of Parliament, passed in the session of 1849, and intituled "An Act for the Incorporation of the General Land Drainage and Improvement Company, and for facilitating the execution of Land Drainage and other Improvements;" and it is hardly possible to name a measure more importantly affecting the landed interest than this. The objects to which its operations may extend, and the character of the direction to which its administration is confided, ensure its usefulness. The powers conferred upon the company may be stated under three heads, viz.:

"1. Of contracting for and executing all works for draining, irrigating with sewer water or otherwise, warping, reclaiming, inclosing, fencing, building on and otherwise improving flooded, uninclosed, waste, and other lands, with money to be advanced by the company or by other parties.

"2. Of performing works and improvements under contract with commissioners of sewers, local boards of health, corporations, trustees, and other public bodies.

"3. Of purchasing, improving, and reselling lands."

They thus possess the power (refused by the House of Commons to the Government last session) of charging land under disability with the cost of erecting farm-buildings; and they are enabled to purchase, improve, and resell land which has hitherto been considered indissolubly tied by the fetters of entail.* Here, then, is a wide enough field for their operations; and that it will be well cultivated, neither the profitable nature of the operations themselves nor the character of the officers whose services have been secured, permit us to doubt.

It may be desirable to give a simple illustration of the mode in which the Act is to be carried into effect. We quote the following from the Company's prospectus:

"Take the case of a nobleman or gentleman, *who is tenant for life of a settled estate*, which is mortgaged or charged with portions, and part of which consists of farms in the occupation of tenants, and needing improvement by drainage. It would be inconvenient to him to advance the amount required to drain the farms, and he is therefore desirous of availing himself of the assistance of the Company.

"The first step, after the Company had entertained his application, would be for them to make an accurate plan, specification and estimate of the proposed improvement.

"On his being satisfied with the plan and the cost of the works, he would enter into a provisional contract with the Company for their execution of the works at the estimated cost.

"Having done so, application would be made to the Inclosure Commissioners to sanction the proposed improvement, and on their favourably entertaining the application they would cause the land and the plan, &c. to be inspected and examined by an assistant commissioner or an engineer, and he would report his opinion thereon.

"On the commissioners being satisfied that the proposed improvement 'would effect a durable improvement in the yearly value of the lands, which will exceed the yearly amount proposed to be charged thereon,' they would sanction the provisional contract, which would thereupon become binding.

"The landowner being, in the case supposed, desirous of avoiding any outlay by himself, and of having the whole expense charged on the inheritance of the lands, would agree with the tenants for their paying the whole or a part of the yearly charge, in the shape of increased rent, and would give notice by advertisement, and to the mortgagees or incumbrancers on the estate, of his intention to apply for such a charge. On application to the Inclosure Commissioners, they would make in the first instance a provisional order, and (after, if they thought fit, an inspection by an assistant commissioner, or an engineer, to ascertain the due execution of the works), eventually an absolute order, charging the expense and the costs of the contract, inspection, &c., on the inheritance of the lands improved.

"The total amount of the charge is not to exceed the value of the improvement to the inheritance, and the charge is to be by way of terminable annuity, *not exceeding as regards drainage* 50 *years, or as regards farm or other buildings* 31 *years.*

"In the case supposed, the landowner would have his farms drained and permanently improved without the expenditure by himself of a single shilling; though, of course, in many cases, he might be willing to ease his tenant by bearing a portion of the yearly charge. The tenant would reap the immediate advantage of the improvement, on payment of such an increase of rent as would still leave him a new profit. The remainder-man, after a few years, would find the estate permanently improved, and freed from the temporary charge."

We shall hereafter describe more in detail the *modus operandi* in cases where farm buildings are to be erected on entailed estates. In the meantime, it may satisfy some of our readers, if we state to them, that we have been informed, on good authority, that there will be no lack of funds. With business men and capitalists managing such a valuable Act as the one referred to, it cannot be doubted that profit will be made; and when profit is to be made, there is always the wherewithal to secure it, if the public have confidence in the management.

* The company are empowered, by agreement, to purchase *any* flooded, uninclosed, waste, and other lands which landowners may be willing to sell, and to improve the same, and to resell the same to such landowners or any other persons; but the total quantity held by the company at any one time is not to exceed 1000 acres.

REPORT ON THE CROPS.

From our own Correspondents.

SCOTLAND. COUNTY.	WHEAT.	BARLEY.	OATS.	GREEN CROPS.	POTATOES.	STOCK OF OLD WHEAT.	WHEAT HARVEST GENERAL.	AUTHORITY.

A DAIRY STOCK.

I recommend the following mode of managing a milk stock, the principles of which are followed by the best milk selling farmers. Curry and wisp the cattle once a day, give water twice a day, when in the stall, and an hour's airing in the yard. Let the food be given to them at exactly the same hour every day, and likewise the water. When food is given, and any cow does not take to it readily, take it from her and let her be without any until next feeding time (this is the way man should do to remain in health). Never pamper immediately after calving. At milking time the master or mistress should assist, or be present, in order to see that the milkers milk briskly, and without talking. A great deal depends on these two points. A milker may sing or whistle, but not talk, but then it must be tuneable. There is an old saying, that the last drop is the richest, and should be drawn. This is wrong, for the last drop from a good milker never does come. I have seen milkers pulling at the udder for the "last drop," while a weakly constituted cow has been nearly sick. A mother who has suckled children can understand this, and yet I have known thoughtless mothers to forget it when milking cows. In dripping a cow, a milker finishes with his right hand, by taking the teats in rotation, and getting what he can out; and when he gets hold of a teat, if he can get milk twice, he must try that teat again after he has gone them round; but if he can only get milk once, he should give up, for the last drop which ought to be taken is then come: and if more after this is got, it is a pull upon the milk veins, and is no richer than milk taken at the first, or rather, it is of an average quality. If a milk farmer intend to follow his business to the best advantage either he or his wife must themselves milk, or be present during the time of milking. One of the best managers I am acquainted with, always did the dripping himself, and left the others to do the regular milking.

The proper temperature for a dairy, where butter is made, will be from 50 to 60 degrees, according to the temperature of the weather. There should be plenty of air circulating through it. If it be too warm where the cream stands, it will lift in the cream mug, and the butter will be rancid; and if it be too cold, the cream will not get sufficiently acid for churning in proper time; in this case the butter will have what we call a bingey taste. Bad dairyers to insure good butter will churn the cream before it is acid, but this is a waste of labour, inasmuch as the cream, in this case, must be churned until it is acid, before the butter will separate from the milk. When churning commences the cream should be at from 62 to 68 degrees, according to the temperature of the weather, or of the room. No water should ever be used about butter in making up, as water left in butter is just as bad as milk, and it will soon make the butter bad. Nothing but labour, by working the butter, will produce real solid sweet butter, and make it keep sweet. The following is a statement for eight years, previous to 1840, of the stock, produce, &c., of a dairy farm in the neighbourhood of Rochdale. The farm is on the mixed system of dairying, that is, part of the milk is sold in the new, part skimmed, the cream being churned, and the skim-milk and butter-milk sold as well as the butter.

Year.	No. of Cows kept.	Quantity of Butter produced	Quantity of New Milk sold.	Value of Butter sold.	Value of Milk sold.	Total value of Produce.	Average produce of each Cow.
		lbs.	Qrts.	£ s. d.	£ s. d.	£ s. d.	£ s. d.
1833	28	6608	5334	359 16 2	345 8 5	705 4 7	25 3 8½
1834	28	6695	6890	364 10 5	347 13 9	712 4 2	25 8 8
1835	27	6733	7735	366 11 7	328 5 11	694 17 6	25 14 7½
1836	25	6112	9380	357 15 8	353 2 0	710 17 8	28 8 8½
1837	25	6010	11390	376 5 0	334 19 10	711 4 10	28 8 11½
1838	24	5929	9391	347 2 2	340 4 10	687 7 0	28 11 1½
1839	25	5618	4743	328 19 4	313 13 1	642 12 5	25 14 1¼
1840	23	5530	2444	346 0 0	371 5 11	717 10 11	31 3 11¼

In addition to the above there were about 150 lbs. of butter, and 1000 quarts of milk annually consumed in the house; value about 15*l*. The cows were kept on pasture in the summer, with about one quarter bushel of grains each daily; in the winter on hay. Potatoes, Turnips, and grains, with Bean flour or Oatmeal. On an average 11 cows were changed (bought and sold), every year, at about 6*l*. loss for each cow changed. The farm was an entire Grass farm, consequently all the provender had to be purchased, and cost, on an average, 150*l*. per year. *Rothwell's Agriculture of Lancashire.*

Or as 14 to 10. *M. Sandford.*

The Cow Parsnip as Food for Stock.—The only species of this plant indigenous in our country is the Heracleum sphondylium. Other species have been introduced, and those who have had occasion to travel by the Great Western Railway may have observed some fine specimens of the Heracleum sibericum on the bank of the approach to the Paddington terminus. Mr. Taunton informed M. Vilmorin, in the communication I referred to at page 523, that he had, for some years, been in the habit of sowing varieties of Heracleum in the autumn in patches amongst his Wheat. The young plant shoots in the following spring, and for the last four years, he says, "I have fed them off regularly with sheep three times in the course of the year. I begin them in April, when they furnish me with the first green food I have to succeed my Turnips and other root crops. Young sheep that have never before fed on it seem to dislike it at first, but those that have eaten it the previous year devour it greedily, as also do the young stock in a very short time; and so well does it agree with them that I give them nothing else for the remainder of the year." Mr. Taunton observed that sheep eat all the different species presented to them, without any apparent preference of one to the other. The H. sphondylium and H. sub-villosum seemed to be liked by cows, horses, and pigs; but there are some other kinds which the latter animals will not touch. The H. asperum seemed to be the most relished by the stock generally. In poor calcareous soils the plant will not attain that height and luxuriance of growth which distinguish it in its own indigenous deep rich earth. It requires a light soil into which its roots can run deeply down. Where Mr. T. had trenched the land the plants grew to the height of from 6 to 9 feet; but when sown on a hard shallow calcareous soil, its size, even after the lapse of three or four years, was quite insignificant. Therefore to prepare the land properly for it, the ground should be ploughed to, at least, the depth of 1 or 1½ foot; or, better still, it should be trenched even more deeply with the spade. The H. asperum, grown in a sandy, ferruginous soil, and deeply trenched, proved to be biennial, and died as soon as its fructification was over; whilst, in a calcareous soil, where it was fed by off by sheep (whether it was that the hard subsoil, arresting the spreading of its roots, prevented its running to seed, or that the same result was caused by the browsing of the sheep), it was as long lived as the other varieties, and, like them, for five years has not once run to a head. It is not easily destroyed where it has once established itself. A piece of ground, in which the plant had been too thinly sown, was ploughed up and harrowed for a fresh sowing. None of the old roots seemed to be injured by the operation; on the contrary, they shot out with increased vigour, seeming to prove that, in an extensive cultiva-

tion of the Heracleum, it should only be grown in land where it is intended to remain for several years; for it would be extremely difficult to get rid of it without far more trouble and expense than a mere ploughing Mr. Taunton had reason to believe that the productiveness of the crop of Heracleum would, after previous manuring, be even increased by a good ploughing and harrowing, but had not actually put this opinion to the test of experiment. It would be very expensive to trench any considerable extent of land for its cultivation; and yet, without that process, the advantages to be expected from its rapid growth and gigantic size could scarcely be looked for. In a deep loamy soil it might be cultivated with less labour and expense, for its roots would be able to spread themselves freely. A root of the H. asperum, dug up by Mr. T., was longer and larger than any Parsnip he had ever seen; and he mentions, on the authority of an able chemist, that the roots of the Heracleum contain more saccharine matter than those of any other plant of the same family, although to the taste they are not as sweet as the Carrot. The different species of Heracleum mentioned by Mr. Taunton are—H. sphondylium, sub-villosum, asperum, capsicum, hispanicum, longifolium, amplifolium, and one which he suspects to have been a hybrid between the H. sphondylium and asperum, as the two plants were growing near each other in his garden. The new plant was remarkable for its vigour and size, and presented many features of the H. sphondylium, but was more luxuriant and of a deeper colour. What has Mr. T.'s experience of the Heracleum been? *Wallia.*

Mowing v. *Reaping.*—In one of your recent numbers appeared some remarks by "R. V.," on the relative advantages of mowing and reaping corn. The writer was evidently a strong advocate for the latter practice, and, as strong advocates frequently do, somewhat exaggerated the data upon which he based his comparison. Now as harvest operations are pretty generally commenced throughout the kingdom, and as the weather seems to be very unsettled, I venture to ask you to give insertion to the results of my experience in the matter, and thus give to those concerned in such questions an opportunity of judging how far their individual circumstances may be best suited for the one or for the other practice. My object being more to place the practice of mowing in a fair light before your readers, than to oppose "R. V.'s" assumptions, I will briefly describe my own harvest arrangements, which are now in active play, and which have been tested by the past two years' experience on the same farm. Economy of labour being as necessary in the manufacture of corn as of calico, I have endeavoured to arrange mine so that the manual labour employed shall be suitable for the particular portion of the work required—that a man shall do a man's work, and a child a child's work, and that there shall be harmony throughout the whole machinery. I have 10 scythes at work. Each mower cuts in, and lays the mown corn up against the standing corn. He is closely followed by a child, as small as you please, whose work is merely to draw bands and lay them down in a straight line, ready for the sheaves; then follows a stout girl (or boy), who takes out the mown corn in her arm, and lays it in sufficient quantity for a sheaf on the band already prepared for it. I now require a good active man as bandster. He follows as closely as he can after the sheaves are laid, and firmly binds them, leaving them lying on the ground, whence they are lifted by another man, whose work is to place them in stooks in the usual manner. One bandster and one stooker are found to be sufficient for every two mowers. The binding is the hardest work, and the men generally change places with the stookers at dinner time. Taking the corn crop through—Wheat, Barley, and Oats—I find that each scythe can easily get through two acres a day, and at that rate the other hands employed are kept steadily at work. The cost of this I give you in the exact wages I am now paying—the mowers, 3*s.* per day; children drawing bands, 6*d.* to 8*d.*; girls taking out corn, 1*s.* to 1*s.* 2*d.*; bandsters and stookers, 2*s.* 2*d.* Thus a day's work with 10 scythes would be as follows:

10 Mowers, at 3*s.*	1	10	0
10 Children, at 8*d.*	0	6	8
10 Girls, at 1*s.* 2*d.*	0	11	8
10 Bandsters and Stookers, at 2*s.* 2*d.* ...	1	1	8
3 Rakers, at 1*s.* 9*d.*	0	5	3
	£3	15	3

This sum, taking 20 acres as the work done, would amount to about 3*s.* 9*d.* per acre; for Wheat alone it would be somewhat higher. Taking 15 acres as the day's work (and we are now cutting more than that), it would give about 5*s.* per acre as the cost. These wages include the usual allowance for beer. As a matter of cost there can be no question between the two modes; and as "R. V." has given its disadvantages, I will conclude by attempting to show its advantages. By mowing you are enabled to concentrate the strength, and get through the harvest much more quickly. By this division of labour you nearly double the effective power of the individual, and thus halve the cost; and you have all the labour under the eye at the same time. You leave far less on the ground than by reaping, as the horse-rake goes over the field after the stooks are lifted, and thus takes up anything that the drag hand-rakes may have left. The corn is ready to carry sooner than if reaped; the stubble is left much cleaner, and the land is ready for the plough directly the crop is carried. The only practical disadvantage that I can admit is the extra work in threshing, and this even is reduced to a very small amount where steam power is available. The carting, stacking, and thatching are of course affected in direct proportion to the length of stubble left by the two operations under comparison—but taking the average difference in the stubble at 6 inches, and the height of the plant at 4 ft. 6 in., it would only give in bulk about one-ninth, or 11 per cent., and in weight only about 5 per cent. of increase. This would, I think, be fully counterbalanced by the cost of mowing the reaped stubble (2*s.* 6*d.* per acre) and of carting it home at a time when the teams are most wanted in the fields. *W., August* 19.

Irrigation.—In looking around me I see streams flowing from the Hastings sand with its oxide of iron falling as a sediment, and from the chalk and oolite formations cold and bright as crystal, each striving for superiority, but little beneficial effect is perceptible on these tenacious clays, if it is not led over the land at the time it carries in suspension the sediment occasioned by floods. But if we travel into Wilts we there see the beautiful clear streams, that issue from the same chalk range, rousing the Grass in early spring amidst snows and frosts. Water flowing from the same strata, and which has passed through no different strata, must be nearly alike in composition, therefore we must look to the natural drainage of the Wiltshire meadows for these differing effects. That which is held in solution by the water cannot be extracted by mechanical means, therefore drainage is necessary in the clays of Dorset, that the water may pass through the soil, which would retain what is otherwise lost. Thorough drainage, an equal division of the irrigating water, and a quicker flow of it over the land, that it may more readily carry away and give off to the air the unwholesome gases generated by the plants, and by the decay of vegetable matter, would effect more than many imagine is possible in these retentive clays. *Geo Summers, Stoke Wake, Dorset.*

The Allotment System at Crowland, Lincolnshire.—Knowing that this influential means of assisting the poor had been for some time in operation at Crowland, I have made inquiries of parties appointed to superintend the occupation of the land, and am happy to find they are enabled to give so satisfactory an account of the tenants. In 1831 a memorial was presented to Thos. Orby Hunter, Esq., the then proprietor of the Postland estate, by several farmers and tradesmen, setting forth that on account of the distress and privation to which the labouring poor were reduced, they hoped he would take into consideration an allotment of land for the use of the labourers of Crowland. This appeal was generously met by the worthy gentleman, who granted 57 acres at 40*s.* an acre rent. One hundred allotments were marked out, of half an acre each, and 25 of about a rood; they were placed under the control of a committee, and a liberal subscription was raised to defray incidental expenses. The property now belongs to the Marquis of Exeter, who continues the management, rent, and tenantry, according to the original plan. The first occupants were selected indiscriminately from among the poor, to test how the utmost benefit could be derived from the adoption of the system; those who did not strictly conform to the rules were discharged, although comparatively few have forfeited their occupation, and not one conviction for dishonesty has occurred among the tenants since the scheme has been established. My chief informant is Mr. Marfleet, the very intelligent and philanthropic treasurer, who is enthusiastic in recommending the extensive adoption of the system in other places; he says the rents are paid pretty punctually, a small premium being awarded for payment on or before the day appointed, which premium is received by four-fifths of the tenants or allottees; half the occupation only is allowed to be in Wheat, the other half Potatoes; but from the failure of Potatoes, other crops have been for the last year or two cultivated, Carrots or Mangold Wurzel, or Beans or Peas. The present appearance of the cropping is described as flourishing, and the land as being in excellent order; the effect of the occupation has been most beneficial on the conduct and character of the occupiers, and the advantages which may be said to extend beyond them, as, in order to be duly qualified for a vacant occupation, a character for honesty and industry is indispensable, and the successful applicant is esteemed fortunate in obtaining an allotment. The land is not allowed to be underlet to a sub-tenant, nor is the Wheat allowed to be sold. Spade husbandry is recommended, but much of the ploughing and carting is done by the employers of the men when a team can be spared, attendance at some place of worship on a Sunday is insisted on, and "no occupier to work on his own land after 6 o'clock in the morning, nor before 6 o'clock in the evening, without leave from his employer; nor be allowed to work on his allotment during the day, when he has refused other work in the morning;" occupation to terminate on the party leaving the town; allowance to be made for seed and labour; no other land to be held with the allotment; a footpath 10 inches in width to be kept on each side next the land marks. Sixpence per half acre is charged for destroying moles, repairing roads, &c.; most of the tenants keep a pig. My friend Mr. M. is so thoroughly convinced of the utility of these allotments, after an experience of 20 years, that he strongly recommends the system for general adoption by all who can appropriate land on similar terms for the improvement of the condition and social habits of the labouring poor. A printed code of rules embracing the above-mentioned and some minor regulations are agreed to and signed by the tenant. *J. W., Peterborough.*

Bacon.—In reply to your correspondent "A. B.," I beg to say I have been in the habit of smoking hams and bacon with pyroligneous acid for several years, and the flavour it communicates has been generally approved. I procure the acid from the chemist, who prepares it of the proper strength and flavour, Westphalia or any other that may be preferred. The hams are cured in the usual way, and, when ready to take out of the brine, are either hung up or set against the salting pan to drain for a couple of days. The acid is then well rubbed over the hams, and they are dried as usual. Two or three tablespoonfuls of acid will be sufficient for a ham about 20 lbs. weight, according as much or little of the smoky flavour is required. *Mary.*

English and Scotch Farming.—I beg to apologise to the readers of your *Gazette* for a mistake at p. 475 concerning the pigs at Sandingburgh, and have likewise to thank Mr. Hutchinson for sending me a note stating my mistake as soon as he observed it in print. He certifies that his words to me were as follows—"Pigs have given me annually a sum of 200*l.* to 300*l.*, all bred by myself, and fed on the produce of the farm." I likewise find that your correspondent "Investigator" hopes for some detailed information concerning the stock and crops at Sandingburgh. "Investigator" must be far behind in feeding cattle for the butcher when he states being "very far" from realising 18*l.* or 20*l.* for his two-year olds. We, in our poor county, often sell our two-year olds at that price, and some as high as 22*l.*; therefore, he must have a bad stock of cattle, or, poorly fed. *H., Aberdeenshire.*

Farm Memoranda.

THE PARISH OF ANAHILT.—The subject of the present sketch is situate in the northern portion of the county Down. Resting on the clay slate formation, the soil is argillaceous, and the surface uneven, being in some parts undulating and in others interspersed with low conical hills. At the commencement of the present century the state of agriculture in this parish was extremely backward: the Potato was the only green-crop cultivated, and even that to a limited extent, whilst the implements of tillage were of the rudest and most primitive description, the wooden plough and wheel car being in general use. But a small breadth of Wheat was at that time sown, the principal grain crop being Oats of a description called Blantyre. Barley was also grown in some instances, and on most farms a patch of Flax. The sowing of Clover and other artificial Grasses was unknown to the bulk of the farmers, so that neither in summer nor winter was there any house feeding provided for the cattle, which in all seasons were allowed to roam abroad over bare and impoverished fields, that scarcely afforded them the means of existence. It may be readily imagined that under this mode of treatment the cattle were of a very inferior kind, and that the supply of manure at the disposal of the farmer was extremely small. This limited supply, after manuring the Cabbage garden, was spread upon a portion of ley ground, which was planted with Potatoes "sodded," or in lazy beds. The following year the Potato ground was sown with Oats and Flax; the Oat crop being repeated until the land was completely exhausted, when it was left out "to rest" as it was called, and another portion of the farm subjected to the same process. By this system of management, the land when laid out for grazing was filled with Couch-grass and other weeds. This defective culture did not, however, induce that poverty among the people that might naturally be supposed; rents were low, and the smaller farmers and their families were employed at the linen manufacture—the men in weaving—and the females in spinning and preparing the Flax: thus combining manufactures with agriculture, which enabled them to enjoy a considerable share of comfort and independence. From the time to which we allude up to the peace of 1815, the high prices obtained for farm produce, owing to the French war, produced what may be called a fictitious prosperity amongst the farming classes, but it does not appear that during this period the system of farming was materially improved. About the date above referred to, the Anahilt Farming Society was established, under the auspices of that distinguished advocate for agricultural improvements, the late lamented Marquis of Downshire; annual ploughing matches were held; iron ploughs, carts, and other improved implements of husbandry were introduced, and a new impetus appears to have been given to the progress of improved cultivation. Although this improvement was not so rapid as might be wished, it has on the whole been progressive. Drainage, though in general partial and inadequately performed, began to be more attended to; old zig-zag and useless ditches were levelled, and straight quick-set fences substituted where required; small patches of Turnips were sown, and the cultivation of the Grasses for Hay and green feeding gradually became general. As a consequence of the introduction of improved implements, the farming operations were performed with more skill and neatness, while the homesteads of the farmers assumed a greater degree of taste and order. This progressive improvement continued up to the falure of the Potato crop in 1845. The system of farming generally pursued was, however, anything but commendable; few of the farmers cultivated Turnips or other root crops as winter feeding for their cattle, devoting all the manure produced on their farms to the Potato crop, of which they raised considerable quantities, and which constituted the chief food of themselves and families, the surplus being sold or used to raise pork for the Belfast

market, and also, to a limited extent, as food for cattle and horses. During the last 20 years the Wheat crop has been more extensively grown, and latterly something more approaching to a proper rotation of cropping has been observed; and on some farms house feeding during the entire year has been adopted. For this purpose a succession of green crops—Turnips, Mangold Wurzel, Rape, Clover, and Vetches are kept up; and the collection of manure, both liquid and solid, is carefully attended to. The rotation pursued on those farms is the five-course shift, Rape and winter Vetches being succeeded by Potatoes or Turnips. It is to be regretted that the above practice is not general, as the previous system of taking two, and in some instances three, consecutive crops of grain, still obtains to a considerable extent; whilst the raising of green crops, the house-feeding of cattle, the collection of manure, and the cleansing of the land from weeds, are still very inadequately attended to. The farms in this parish vary in extent from 5 to upwards of 100 statute acres; the occupiers of small farms employing their leisure time at the cotton manufacture, the weaving of linen being almost given up, owing to the extremely low wages paid to linen weavers. From the foregoing outline, it will be seen that although the parish of Anahilt has made considerable advances, and has borne the pressure of the last four years as well perhaps as any locality in Ireland, there is still great room for improvement in the mode of tillage generally prevailing. Knowing that the people are intelligent, frugal, and industrious, we have no doubt that when the present unsettled state of agricultural affairs shall have passed away, the farmers of Anahilt will not lag behind in the march of improvement. It has been said that "the first step to improvements is the desire for improvements," and we are aware that in this parish the desire is fairly awakened. *John P. Hagan, in the Journal of the Chemico-Agricultural Society of Ulster.*

MR. KNOWLES' FARM NEAR BURY.—Joshua Knowles, Esq., Stormer Hill, Tottington, near Bury, is another of the class of spirited and determined improvers; having to combat against the unfavourable circumstances of a high altitude, an inferior climate, and an indifferent soil. As an example of what can be done in so unfavourable a situation, I shall here give the management of his farm, of which he is part owner and occupier, and part occupier only. The following is what I wrote upon going over the farm in the autumn of 1843. I have frequently been on the farm since, the last time being in the autumn of 1848. It is still carried on in the same spirit, and with the same results; the only difference being, that he now occupies more land than he at that time did. The farm contains 101 statute acres, one half of which is tolerably level. The soil of this part is mostly a strong loam, resting upon clay. The surface soil is from 10 to perhaps 18 inches deep. The remaining part of the farm lies at a considerable angle, and is much undulated. The surface soil upon this part of the farm is thin, and the subsoil a stiff clay. The lowest part of the farm will be about 350 feet above the level of the sea, and the highest part nearly double that height. The average fall of rain will be 40 inches at the least. Of course, the climate, either as to cold or moisture, is not a good one, and little adapted for the cultivation of corn. In the neighbourhood, there is a good demand for milk and butter; and the whole of the produce is converted into these articles, except that which is required for the keep of horses. The whole of the farm has been drained by the present occupier. Most of the old crooked fences are levelled, new ones planted where required, and good occupation roads made. The buildings have also been made substantial and convenient, and are mostly new. Two tanks have been made for urine and dung water, each 10 feet by 10 feet, and 4 feet deep, and are so situated that the liquid can be drawn off at the bottom into a water cart, and taken to the land. This is spread upon the meadow land, which consists of 50 acres, kept in a highly productive state by irrigation with water from a brook, or with liquid and solid manure. One meadow has had eight good crops of Grass cut from it during the last three years. Last year, there were 26 acres of Italian Rye-grass and Clover cut for soiling horses, and for hay. Part of this had been sown in the spring of that year, another part in the spring of 1842, and the remainder in 1841; but two years appears to me to be long enough to allow it to remain growing; for, in the third, it is generally thin of plants. For the first and second years, it was cut three times each year. In 1842 these were 13 feet in length, at three cuttings, from a field sown that spring, in the month of March. In the following year a field of 7½ acres kept 70 head of cattle for 15 days, beginning on the 9th of June. On July 28 the second cutting was commenced, there being an exceedingly full crop. In the same year there were 8 acres and 2 roods of Swedish Turnips, and 4 acres and 1 rood of Oats; no Wheat or Barley, a few Potatoes, and 10 acres of permanent pasture. There are also woodland, gardens, and pleasure ground, to the extent of 3 acres or more. The rotation is as follows:—1st, Turnips or Potatoes after Italian Rye-grass and Clover, or Oats; 2d Italian Rye-grass and Clover, cut for soiling or hay; 3d year the same; and the 4th also the same, except a part in Oats. The stock kept during that year consisted of 40 milk cows, one bull, 13 heifers, stirks, and calves, and 16 horses. There is a print and bleach works connected with the farm, in which a considerable number of horses are employed. Within these few years there have been 19 acres marled, and also a considerable portion of lime used within the previous eight or ten years. The ploughing is always deep, whether the surface soil be shallow or not; but only one furrow deep, not subsoiled or trenched. The Turnips and Potatoes are cultivated in ridges, these being from 30 to 36 inches from centre to centre, with the intervals deeply horse-hoed, several times previously to the tops closing. The Turnips in the rows are thinned to from 12 to 15 inches distance. A heavy dressing of manure is given to the crop, which is a mixture of stable dung, night soil, and ashes. The quantity is about 35 tons on an average to an acre. In 1842 the Turnip crop was upon the highest and worst part of the farm, and the crop averaged 33 tons per acre, being a very even clean crop. It took the prize from the Manchester Agricultural Society. On the second day of August in the following year, I was upon the farm, when the Turnip crop had the appearance of being the heaviest crop I had ever seen; but I was informed that the mildew took them in a few weeks after, which prevented them getting anywhere near the weight they otherwise would have been; but, notwithstanding this, the crop would yield 30 tons per acre, as I have been told. A few years previously to the date of these occurrences, the field which was sowed with Turnips in 1842 was not worth the rent of 10*s.* per acre. In the year 1843, Mr. Knowles had a premium awarded him by the Manchester Agricultural Society, for the best cultivated farm, as owner. Although he was merely the owner of a part, he could not compete as an occupier only. *Rothwell's Agriculture of Lancashire.*

Notices to Correspondents.

DAIRY MANAGEMENT: *T B.* would be glad of some information on a dairy subject. His butter has been soft and oily for several weeks, a fault it has never had before, though he has the same cows, the same pasture, and the same dairy maid. The cows are fine animals, of the Jersey breed; the cream is churned twice a week, in a wooden box-churn, in a cool place. He is not aware of any change in the plan, which, till lately never failed in giving a large supply of the finest butter.

ITALIAN RYE-GRASS: *Exeter* It may be fed after harvest, if very forward, without harm to the plant.

MANGOLD WURZEL: *W N R.* You will not injure the roots by taking their lower leaves just before they turn yellow.—*Pen.* Sprouted Mangold Wurzel must be pulled up and given to the pigs. The early seeding of the root may be owing to too early sowing. Pulling off the leaves, whether "lower" or not, will injure the plant, if they are still young and growing. If they are on the point of withering, they may be pulled, because they are then probably of more use as food directly, than they are in assisting the growth of the root.

RAPE: *P.* Your note did not contain your address. The question would have been answered before if it had been received. Sow 3 lbs. of Rape seed in rows 12 inches apart on a soil in good tilth; and you may sow 2 or 3 cwt. per acre of Peruvian guano broadcast the day before, and harrow it in. You will yet have a useful crop for sheep in spring, but it is getting late.

SALT: *B.* Apply about 2 cwt. of salt per acre during rainy weather in April. If the sun has killed the root-weeds, you may plough them in.

SCYTHES: *E J C.* Messrs. Drummond, of Stirling, advertise cradle scythes for harvest work. To mow and tie a crop of 30 bushels with ordinary bulk of straw, is worth here about 7*s.* 6*d.* to 8*s.* per acre, men earning 2*s.* 6*d.* to 3*s.* 6*d.* during a good harvest day. Bagging is a little dearer, and reaping 1*s.* to 1*s* 6*d.* per acre dearer.

STADDLES FOR CORN: *A Country Curate.* We should prefer the iron to the stone staddles were it not for the greater expense of the former.

Markets.

COVENT GARDEN, Aug. 31.

Vegetables are abundantly supplied; Hothouse Grapes and Pine-apples plentiful; the supply of Peaches and Nectarines from the open walls but middling. Gooseberries are nearly over. Oranges and Lemons though scarcer are sufficient for the demand. Plums and Pears are still received from the Continent in great abundance. Filberts are plentiful. Carrots and Turnips may be had at 3d. to 6d. a bunch. Potatoes are good and cheap. Lettuces and other salading are sufficient for the demand, and so are Mushrooms. French Beans are scarcer. Cut Flowers consist of Heaths, Pelargoniums, Carnations, Picotees, Asters, Fuchsias, Mignonette, Dahlias, Verbenas, Bignonia venusta, Stephanotis floribunda, Heliotropes, Calceolaria viscosissima, Japan Lilies, and Roses.

HOPS.—FRIDAY, Aug. 30.

Messrs. PATTENDEN and SMITH report that the demand for fine 1848 and 1849 Hops continues good. Duty 200,000*l.*

SMITHFIELD, MONDAY, Aug. 26.

We have a large supply of Beasts; however, trade is good for the best qualities. All kinds meet with a fair demand. The number of Sheep and Lambs is also large; late rates are well maintained. Although Calves are plentiful, choice ones are freely disposed of at rather more money. From Holland and Germany there are 931 Beasts, 4900 Sheep, and 216 Calves; from Scotland, 100 Beasts; and 2300 from the northern and midland counties.

Per st. of 8 lbs.—	s	d	s	d	Per st. of 8 lbs.—	s	d	s	d

					Pigs	...	3	0 — 4	0

Beasts, 4184; Sheep and Lambs, 31,620; Calves, 332; Pigs, 255.

FRIDAY, Aug. 30.

The supply of Beasts is good; trade is dull at rather lower prices. The number of Sheep is large for the time of year; the demand is limited, at about 2d. per 8 lbs. reduction. There is very little inquiry for Lamb, only a few choice ones are saleable. Calves are plentiful; inferior are much lower, and trade scarcely so good for the best. From Germany and Holland there are 420 Beasts, 1990 Sheep, and 319 Calves; from Scotland, 50 Beasts; 300 from Leicester and Northampton; and 93 Milch Cows from the home counties.

Beasts, 1117; Sheep and Lambs, 12,860; Calves, 602; Pigs, 245.

MARK LANE.

MONDAY, Aug. 26.—There was a fair supply of Wheat from Essex this morning, but it consisted almost entirely of the new crop, quality good. The show on the Kentish stands was small, and chiefly old; the sale was slow, and last week's prices barely maintained. There was an improved demand for foreign Wheat, at a reduction of 1*s.* to 2*s.* per qr., but holders being generally firm restricted business.—Barley meets a good sale at our extreme quotations; there were a few samples of new at market, quality better than expected; they were sold at 28*s.* per qr.—Beans and Peas are inquired after, at late rates.—There is a good demand for Oats, and the turn is in favour of the seller.

FRIDAY, Aug. 30.—There has been a fair arrival of Wheat this week, but small of all other articles. This morning's market was thinly attended, and Millers continue to hold off from purchasing.—Prices of Wheat, Beans, and Peas are unaltered from Monday, but good fresh Barley and Oats are the turn dearer.—The Flour trade is heavy, but holders are not disposed to accept lower prices.—Business to some extent has been transacted in Indian Corn afloat, at 27*s.* 6*d.* to 28*s.* 6*d.* per qr. for Galatz.

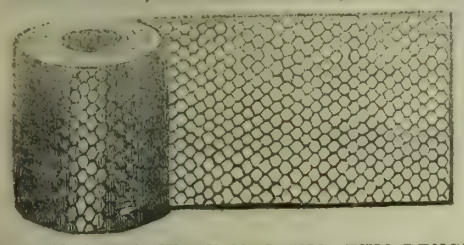
LIVERPOOL, FRIDAY, Aug. 23.—The weather since Sunday has been boisterous and cold in this district, and the operations of harvest have been checked. The prices of grain and Flour, however, have been scarcely affected. The weather is fine again to-day. The demand for Wheat and Flour is languid, but holders are firm at Tuesday's prices. Oats and Oatmeal are both dull of sale, and easier to buy. Barley, Beans, and Peas each find a good demand at full prices. Indian Corn is more in favour, and 27*s.* per 480 lbs. was made of American yellow corn to-day, which is an improvement of 6*d.* per qr. Arrivals into Liverpool from the 20th to 22d Aug., inclusive: Wheat, 11,323 qrs.; Barley, 15 qrs.; Malt, 798 qrs.; Oats, 153 qrs.; Beans, 4 qrs.; Indian Corn, 1800 qrs.; Oatmeal, 955 sacks; and 5520 sacks and 12427 barrels of Flour.—TUESDAY, Aug. 20.—We have had moderate supplies of grain, meal, and Flour from Ireland and coastwise this week, but have good arrivals of Wheat and Flour from abroad. The business of the week has been to a fair extent in most of the leading articles, but without much variation in prices. At this morning's market we had a larger attendance of buyers than for a length of time. A considerable extent of business was transacted in Wheat, at the extreme prices of last Tuesday. Flour was in good request, at late rates. Barley, Oats, Beans, and Peas were each likewise quite as dear. There was rather more inquiry for Indian Corn, and not much being offered, it advanced 1*s.* per qr. on this day se'nnight. Present prices: Wheat, English red, per 70 lbs., 5*s.* 10*d.* to 6*s.* 4*d.*; white, 6*s* 0*d.* to 6*s.* 7*d.* Barley, Scotch and Irish, per 60 lbs., 2*s.* 10*d.* to 3*s.* 1*d.* Malt, English, per qr. pale, 48*s.* to 52*s.* Oats, English and Scotch, per 45 lbs., 2*s.* 7*d.* to 2*s.* 9*d.* Beans, English, per qr., 28*s.* to 32*s.* Peas, do. do., 27*s.* 6*d.* to 30*s.*

FOR WATERING GARDENS, BREWERS' USE, &c.
FLEXIBLE INDIA-RUBBER HOSE PIPES.

JAMES LYNE HANCOCK, Sole Licensee and Manufacturer of the PATENT VULCANISED INDIA-RUBBER PIPES and TUBING.

These Pipes are well adapted for Watering Gardens, conveying Liquid Manure, racking Beer and Cider, Gas Fittings, Chemical and all purposes where a perfectly sound WATERPROOF and FLEXIBLE PIPE is required.

Hot Liquors or Acids do not injure them. No oil or dressing is required in using them. They do not leak from remaining out of use, are permanently Flexible in all Temperatures, and are therefore particularly suitable for Fire Engines; and, from their not leaking, are found exceedingly useful in conveying hot or cold water to baths in dwelling houses and such like purposes.



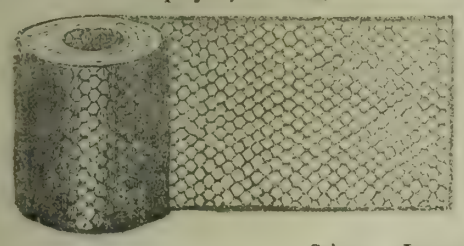
A LIGHT VULCANISED INDIA-RUBBER HOSE is now manufactured for conducting Water and Fluids, at the following prices per foot:

Size.	¼ in.	½ in.	¾ in.	1 in.	1½ in.	2 in.	2½ in.	3 in.
1 ply ...	0s. 5d.	0s. 6d.	0s. 8d.	0s. 10d.	1s. 0d.	1s. 2d	1s. 4d.	1s. 6d.
2 ply ...	0 8	0 9	1 0	1 2	1 5	1 8	2 0	2 3
3 ply ...	0 11	1 0	1 3	1 6	1 10	2 2	2 9	3 3

N.B. Vulcanised India-Rubber Garden Hose fitted with roses, jets, and branches, complete, with union joints ready to attach to pumps or water cisterns.

All orders or letters addressed to J. L. HANCOCK, at the Manufactory (and Warehouse), Goswell-mews, Goswell-road, London, will meet with immediate attention.

WIRE NETTING, ONE PENNY PER SQUARE FOOT.



GALVANISED WIRE NETTING, TWO-PENCE PER SQUARE FOOT.—This article requires no painting, the atmosphere not having the slightest action on it. It was exhibited at the late Metropolitan Cattle Show, and was highly eulogised both for its utility and pretty appearance, and acknowledged to be the cheapest and best article ever produced. It forms a light and durable fence against the depredations of hares, rabbits, and cats, and is peculiarly adapted for Aviaries, Pheasantries, and to secure poultry; and by the galvanised requiring no paint, it answers admirably for training all kinds of creeping plants. Large quantities always kept in stock, of 18, 24, 36, and 48 inches wide; it can, however, be made to any dimensions desired. Patterns forwarded free of expense.

12 inches wide	3d. per yard.	30 inches wide	7½d. per yard.
18 " "	4½d. "	36 " "	9d. "
14 " "	6d. "	48 " "	1s. "

Galvanised do., 1d. per foot extra.

Extra strong Imperial Wire Sheep Netting, 3 feet, 1s. 6d. per running yard; if galvanised, 2s. Also every description of Wire Nursery and Fireguards. Wire House-lanterns and Shades, Fly-proof Dish Covers, Meat Safes, &c.; Window Blinds, 1s. 10d. per square foot, with bolts complete, in mahogany frames; Gothic Garden Bordering, 6d. per running foot; Flower Trainers, from 3d. each; Garden Arches, 20s. each; Flower Stands, from 3s. 9d. each; Galvanised Tying Wire for plants and trees, Dahlia Rods, and every description of Wirework; Weaving, for the use of paper-makers, millers, &c.—At the Manufactory of THOMAS HENRY FOX, 44, Skinner-street, Snow-hill, London.

GALVANISED WIRE GAME NETTING.—7d. per yard, 2 feet wide.

	Galvanised.	Japanned Iron.
2-inch mesh, light, 24-inch wide ...	7d. per yd.	5d. per yd.
2-inch " strong " ...	9 "	6½ "
2-inch " extra strong " ...	12 "	9 "
1½-inch " light " ...	8 "	6 "
1½-inch " strong " ...	10 "	8 "
1½-inch " extra strong " ...	14 "	11 "

All the above can be made any width at proportionate prices. If the upper half is a coarse mesh, it will reduce the price one-fourth. Galvanised sparrow-proof netting for pheasantries, 3d. per square foot. Patterns forwarded post-free.

Manufactured by BARNARD and BISHOP, Market-place, Norwich, and delivered free of expense in London, Peterborough, Hull, or Newcastle.

THE HIPPOPOTAMUS presented by H. H. the Viceroy of Egypt to the Zoological Society of London, is exhibited daily from One to Six o'clock, at their Gardens in the Regent's Park. The Band of the First Life Guards will perform, by permission of Colonel Hall, every Saturday, at Four o'clock. Admission One Shilling, on Mondays Sixpence.

INTERESTING FACT.—The following singular and authentic case of restoration of the human hair is worthy of observation, more particularly as it relates to an article of high and universal repute during the last half century. "Mr. A. Hermann, of Queen-street, Soho, had been quite bald for some time past, and had tried various preparations for the recovery of his hair, but without any beneficial result. He was then induced to try the effects of 'Rowland's Macassar Oil,' and after daily applying it for about two months, he, much to his gratification, had his hair quite restored, and now possesses a beautiful head of hair. This fact speaks too strongly for itself to require comment."—*Bell's Weekly Messenger.*

ROWLAND'S MACASSAR OIL.—The unprecedented success of this does very in restoring, preserving, and beautifying the Human Hair, is too well known and appreciated to need comment. For Children it is especially recommended as forming the basis of a Beautiful Head of Hair, and rendering the use of the fine comb unnecessary. Price 3s. 6d.—7s.—Family Bottles (equal to 4 small), 10s. 6d., and double that size, 21s. per bottle.

*** Each bottle of the genuine article has the words ROWLAND'S MACASSAR OIL engraved in two lines on the Wrapper; and on the back of the Wrapper nearly 1500 times, containing 29,028 letters.

Sold by A. ROWLAND and SONS, 20, Hatton Garden, London; and by Chemists and Perfumers.

THE ELEMENTARY CATECHISMS.
Just published, price 4d.,

THE CATECHISM OF GARDENING.

CONTENTS.—The Rise and Progress of Gardening in England—The Soil and Situation desirable for a Garden—On Enclosing and Laying-out a Garden—On the Preparation of the Soil—Manures—The Growth of a Plant from Seed—Kitchen Garden—Rotation of Crops—The Fruit Garden—Propagation of Fruit Trees—Varieties of Fruits and Vegetables—The Flower Garden—Flowering Plants for Windows—On Pruning—On Weeding—List of Plants suited to Pots in Windows—List of Tools necessary in an ordinary Garden.

The above is by an eminent writer on subjects connected with Rural Economy, and will be found a most useful as well as interesting little work.

Also, just published, forming part of the same series, and at the same price, each containing 64 pages, strongly stitched in neat cover,—SANITATION THE MEANS OF HEALTH; GEOGRAPHY, first lessons; HISTORY OF ENGLAND in a few days).

This cheap series of Catechisms are all well written, carefully prepared books, are eminently adapted for schools for the poor, and equally so for home instruction.

A CASE OF SEVERE DEBILITY AND LIVER COMPLAINT CURED BY HOLLOWAY'S PILLS.—Extract of a letter from R. Coogan, Esq., professor of languages and mathematics, 142, Upper Dorset-street, Dublin, dated Aug. 1, 1850. To Professor HOLLOWAY.—"Sir—Wishing to testify my gratitude for the incalculable benefit which I have received by taking your excellent Pills, I feel that I am but paying a just debt in acknowledging that I have been restored to perfect health solely through their use, after suffering for five years general Debility, Bile, and disordered Liver. I am now so strong that neither change of weather, colds, or indulgence of any kind ever affect me."—Sold by all Druggists, and at Professor HOLLOWAY'S Establishment, 244, Strand, London.

DR. LOCOCK'S ANTIBILIOUS WAFERS are the only Safe Remedy for all Bilious Affections, Heartburn, Sick Headache, Giddiness, Pains in the Stomach, Flatulency or Wind, and all those complaints which arise from Indigestion or Biliousness. They do not contain calomel or any other mineral. Sold at 1s. 1½d., 2s. 9d., and 11s. per box. Testimonial—"Gentlemen—We have much pleasure in bearing testimony to the very great efficacy of Dr. Locock's Wafers; we have no hesitation in saying this from our own experience, and they continue to give the same satisfaction wherever they are introduced, &c. Signed, J. R. ALLAN and Co., 42, Kirkgate, Leith, Aug. 17, 1850." Also, Dr. LOCOCK'S PULMONIC WAFERS, for Asthma, Consumption, Coughs, &c. To avoid Counterfeits, observe the words "Dr. LOCOCK'S WAFERS," in the Government Stamp.—Sold by all Medicine Vendors.

IMPORTANT INFORMATION.

DR. ROBERTS'S celebrated OINTMENT called the POOR MAN'S FRIEND, is confidently recommended to the Public as an unfailing remedy for wounds of every description, a certain cure for ulcerated sore legs (if of 20 years' standing), cuts, burns, scalds, bruises, chilblains, scorbutic eruptions and pimples in the face, sore and inflamed eyes, sore heads, sore breasts, piles, fistula, and cancerous humours, and is a specific for those afflicting eruptions that sometimes follow vaccination. Sold in pots at 1s. 1½d. and 2s. 9d. each. Also his PILULÆ ANTI-SCROPHULÆ; confirmed, by more than 40 years' experience, to be without exception one of the best alterative medicines ever compounded for purifying the blood and assisting Nature in all her operations: hence they are useful in scrofula, scorbutic complaints, glandular swellings (particularly those of the neck, &c.) They form a mild and superior family aperient, that may be taken at all times without confinement or change of diet. Sold in boxes at 1s. 1½d., 2s. 9d., 4s. 6d., 11s., and 22s. each.—Sold wholesale by the proprietors, BEACH and BARNICOTT, at their Dispensary, Bridport, and by the London Houses; and retail, by all respectable Medicine Vendors in the United Kingdom.

RURAL CHEMISTRY. By EDWARD SOLLY, Esq., F.R.S., F.L.S., F.G.S.; HON. MEMB. ROY. AGR. SOC. ENG.; Professor of Chemistry to the Horticultural Society of London; Lecturer on Chemistry in the Hon. E. I. Co.'s Military Seminary at Addiscombe, &c.

London: J. MATTHEWS, 5, Upper Wellington-street, Strand and may be ordered of all booksellers.

STRATTON'S CELEBRATED AGRICULTURAL REPOSITORY, ESTABLISHED A.D. 1750.
IMPORTANT NOTICE TO AGRICULTURISTS, IMPLEMENT-MAKERS, WHEELWRIGHTS, EMIGRANTS, TIMBER-MERCHANTS, IRON-MERCHANTS, CONTRACTORS, ENGINEERS,
AND THE PUBLIC GENERALLY.

MESSRS. BARNARD, THOMAS, AND Co., in consequence of the Terms of the Dissolution of the Partnership of Messrs. Stratton, Hughes, and Co. (Successors to Mr. RICHARD STRATTON), Patentees and Manufacturers of WHEELS, CARTS, WAGGONS, and AGRICULTURAL IMPLEMENTS, and GENERAL AGRICULTURAL ENGINEERS, CLARKE-STREET, BRISTOL,

will have the honour of submitting to PUBLIC COMPETITION, without reserve, in the early part of OCTOBER next, the Valuable and Extensive MANUFACTURED and UNMANUFACTURED STOCK of this First-rate Establishment.

The MANUFACTURED STOCK consists of every description of Cart and Waggon, with all the most recent improvements in Liquid Manure Collectors and Distributors, Drays, Trolleys, Light Spring Carriages, Sugar Carts, Tillage Implements (including the celebrated Norwegian Harrow), West Indian Implements, Horse-hoes, Reaping and Harvesting Implements, Barn Implements, Corn-crushers, and all other Machines for preparing food for cattle; Draining Tools, Dairy Utensils, Horticultural Implements, Cider Presses, Potato-pulping Machines, Jacks for lifting carriages and heavy weights, Stable Implements, Rick Ventilators, Stone and Bone-breaking Machines, Trucks, Barrows, Harness, a quantity of Milner's Patent Safes, and a variety of Models and other articles, partly of their own manufacture and partly selected from the workshops of the most celebrated makers.

In the UNMANUFACTURED DEPARTMENT there is an extensive Stock of PRIME and THOROUGHLY-SEASONED ENGLISH and AMERICAN OAK, ELM, ASH, PINE, and DEAL TIMBER, with a large assortment of LANCEWOOD SHAFTS, WOODEN STOCKS, SPOKES, FELLOES, &c.

Also, English and Welsh Bar Iron, Hoop Iron, Bradley's Rods, Spring Steel, Hoop Tyre, Iron Naves, Axles, Wheels, Castings of every description, with a LARGE and GENERAL ASSORTMENT of IRONMONGERY, and other articles too numerous to detail.

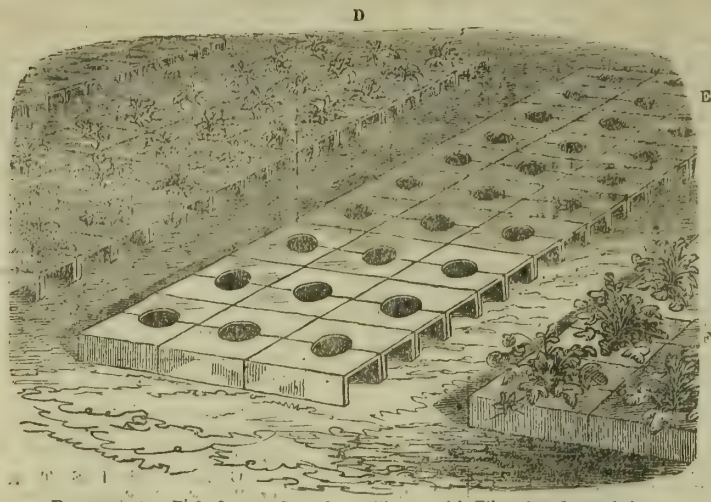
Messrs. STRATTON and Co. have for many years been successful Competitors for the Prizes of the Royal, North Lancashire, Yorkshire, and other Agricultural Societies, especially for Carts, Waggons, Ploughs, the Norwegian Harrow, &c. They possess the Patent Right in

STRATTON'S PATENT HOLLOW WROUGHT IRON READ'S PATENT SUBSOIL PLOUGH,

And in various REGISTRATIONS for TUMBLER and LIQUID MANURE CARTS, and other articles.

They are also Agents for most of the Patented articles and Implements of other makers, specimens of which will be found in the Stock, and are the principal Manufacturers of Carts, Waggons, and Agricultural Implements in the West of England. A stock of this description, and of such magnitude and importance, has rarely, if ever, been offered for Sale by Auction. Descriptive Catalogues, with the days of sale and viewing, will be announced as early as practicable.

Messrs. B., T., and Co. are also instructed to offer for SALE by PRIVATE TREATY, the LEASE of the extensive PREMISES, with the PLANT, MACHINERY, IRON FOUNDRY, SMITHERY, &c.



These Premises cover more than an acre of ground, and are admirably adapted in every way for a Wheelwright's, Cart, and Carriage Builder's business on a large scale, combined with the Manufacture of every kind of Agricultural Implements. They are also highly suitable, with slight alteration, for building Steam Engines, Railway Carriages, &c.; and are also well adapted, by position and arrangement, for division into four or five distinct properties, in each of which a lucrative business may be successfully carried on. They are bounded on the east side by the line of the proposed new street from the Railway Station to Stoke's Croft, which will probably form one of the most important thoroughfares in Bristol, and exceedingly improve the value of this property.

All further particulars may be obtained on application to J. BARKER, Esq., Solicitor, Broad-street, Bristol; to Messrs. COLLEY, SMITH, HUNTER, and GWATKIN, Lincoln's-inn, London; or of the Auctioneers, Bristol.

TO BE LET, with possession at Michaelmas next, about 3 acres of NURSERY GARDEN, well stocked, and in good order. A comfortable House upon the ground. The whole to be had on moderate terms. It is a more than usually neat occupation in the town of Stowmarket, near the Railway from London to Norwich and Bury St. Edmund's. An industrious person of good character, well acquainted with his business, and able to command 500*l.*, would be treated with on application to MRS. THOMAS PRENTICE, Stowmarket, Suffolk.

WANTED, to rent or purchase, a COUNTRY RESIDENCE, furnished or unfurnished, near to the parish Church, and not far from a Railway station. The House must be in park-like grounds, commanding views of the sea or inland scenery, and consist of good Drawing and Dining-rooms, Library, three best Bed-rooms, besides Servants' rooms, Stabling, Gardens, and the usual Offices, suited to a small respectable family, without children.—Address, with full particulars of price, situation, &c., J. H., Mr. Simmons' Library, 64, Edgeware-road, London.

A Representation of ROBERTS'S Plan of growing Strawberries on his Patented Tiles.

D represents a Bed of young Strawberry Plants, with Tiles placed round them.
E shows a Bed with Tiles placed down without the plants.
F shows the end of a Strawberry Bed with the fruit and foliage upon the tiles.

A Representation of ROBERTS'S Plan of growing Celery, with his Patented Sockets.

A represents two rows of Celery in the trench before the Sockets are used, with the horizontal tube placed between them for the purpose of watering.

B shows two similar rows with the Sockets placed round each head of Celery prior to earthing against them.

C shows the Celery earthed up, as it appears about the end of September.

THE above Drawings have been engraved in consequence of the inventor having received information from many parties that the directions given in his Pamphlet have not been attended to, because of the difficulty which many gardeners have of comprehending written instructions. A New Edition of the Pamphlet, containing the Inventor's method of cultivating various other Fruits and Vegetables, can be had, free, on enclosing three postage stamps to Mr. JOHN ROBERTS, 34, Eastcheap, London.

"Familiar in their Mouths as HOUSEHOLD WORDS." *Shakespeare.*

Office, 11, Bouverie-street; and all Booksellers and Newsmen.

CHELSEA.—IMPORTANT SALE OF NURSERY STOCK.
TO NOBLEMEN, GENTLEMEN, AND OTHERS, ENGAGED IN PLANTING.

MR. D. A. RAMSAY has received instructions to submit to public competition, by Auction, on the Premises, opposite Cremorne Gardens, King's-road, Chelsea, about the last week in September (without reserve), by order of Messrs. W. DENNIS and Co., to clear about 5 acres of the land required for building purposes. The Stock comprises a large assortment of fine Evergreens, large Irish Ivies and other creepers in pots, 300 varieties of the finest Prize Gooseberries, a large quantity of Mulberry Trees of all sizes, the collection of Standard, Dwarf, and Pillar Roses, choice Deciduous Shrubs, Ornamental Trees, &c. The Stock on view till the time of sale; and for further particulars, see future Advertisements.

Brompton Auction Ground, Fulham-road, Brompton.

This day is published, price 2*s.* 6*d.*, No VII. of

PAXTON'S FLOWER GARDEN.

Edited by DR. LINDLEY and JOSEPH PAXTON,
And Illustrated by highly finished Plates and Woodcuts.
London: BRADBURY and EVANS, 11, Bouverie-street.

FULHAM ROAD.
TO GENTLEMEN, NURSERYMEN, AND OTHERS.

MR D. A. RAMSAY has been favoured with instructions from Mr. J. Shearman, to submit to public competition (his lease having expired), on the premises, near Queen's Elm, Fulham-road, Brompton, about the first week in October, a portion of the VALUABLE NURSERY STOCK, comprising Standard and Dwarf-trained Peaches, Nectarines, &c., a large quantity of fine Evergreens, Deciduous Shrubs, Ornamental Trees, &c. A choice assortment of Standard and Dwarf Roses, &c. Further particulars in future Advertisements.—Brompton Nursery, Fulham-road, Brompton.

ORCHIDS AND PITCHER PLANTS.

MR. J. C. STEVENS begs to announce for Sale by Auction, at his Great Room, 38, King-street, Covent-Garden, on FRIDAY, Sept. 6, at 12 o'clock, the COLLECTION OF ORCHIDS of a Gentleman, comprising Established Plants in good health of most of the popular East Indian, Mexican, and South American species; also a few rare Pitcher Plants, including Nepenthes sanguinea.—May be viewed the day prior and morning of sale, and Catalogues had.

DALSTON NURSERY.
GREAT SALE OF GREENHOUSES, PITS, &c.
TO NOBLEMEN, GENTLEMEN, NURSERYMEN, BUILDERS, AND OTHERS.

MESSRS. PROTHEROE AND MORRIS are instructed, by Mr. J. SMITH, to submit to public competition by Auction, on the premises, Dalston Nursery, Middlesex, on MONDAY, September 2, at 12 o'clock (in consequence of the premises being required by the London and Birmingham West India Dock Junction Railway Company), the erection of 14 Greenhouses, several Pits, and one, two, and three-light Boxes, the greater portion of which are glazed with green glass; also a considerable quantity of Bricks, Paving Stones, Hot-water Pipe, Furnaces, &c. May be viewed prior to the sale. Catalogues may be had of the principal Seedsmen in London, on the Premises, and of the Auctioneers, American Nursery, Leytonstone, Essex.

N.B. The whole of the choice Greenhouse Plants (including the Camellias, ranging from 18 inches to 10 feet, beautifully set with bloom buds) will be sold by Auction the latter part of September.

HERTS.—VERY SUPERIOR FARMS TO BE LET, FROM MICHAELMAS NEXT.

MR. HURLEY, FARM AGENT and VALUER, is instructed to Let TWO CAPITAL FARMS, situate as above, within 26 miles of London, and close to a Station of the Great Northern Railway, and a principal Market-town.—No. 1 consists of 456 acres of sound Arable Land, producing the best qualities of Wheat, Barley, &c., and very congenial to the growth of Turnips, and capable of carrying a large number of sheep to the acreage, with 70 acres of rich meadow together with a very genteel Residence, and requisite Farm Buildings attached. Rent, 18*s.* per acre. Tithe and rates very low.—No. 2 consists of an excellent Farm Residence and Outbuildings adjoining, centrally situate, and about 286 acres of first-rate land. Rent, 21*s.* per acre. Rates and tithes very low. Valuations moderate.—Apply (enclosing two stamps) to the Auctioneer, 62, Nelson-square, Blackfriars-road, London.

SUSSEX.—FARM TO BE LET AT MICHAELMAS NEXT.
RARE OPPORTUNITY.

MR. HURLEY, ESTATE AGENT and SURVEYOR, is instructed to Let a small FARM, near Tunbridge Wells, south of London, of 61 acres, one-third Meadow, the rest Pasture and Arable Land; neat Farm-house and Homestead, two Barns, Stabling, &c., and two Cottages let at 10*l.* and 11*l.* a year each; Gardens, &c. Rent, for the whole, 59*l.* per annum, upon Lease, for 7 years and upwards. Tithe and Rates 4*s.* 6*d.* per acre.—Apply immediately, enclosing two stamps, to the Estate Offices, 62, Nelson-square, Blackfriars-road, London.

FIRST-RATE FARM TO BE LET, NEAR WINDSOR, BUCKS, AND WITHIN 20 MILES FROM LONDON.

MR. HURLEY has to Let a really splendid FARM, in this desirable locality, in first-rate condition, and containing about 160 acres of rich Meadow and Arable Land, with excellent Residence and Farm-buildings.—Apply for terms to the Agricultural Agency Offices, 62, Nelson-square, Blackfriars-road, London.

Also other excellent smaller Farms in the neighbourhood.

SUSSEX.—To be Let, a superior FARM, 230 acres, in the parish of Twineham, 168 acres arable and 41 acres meadow; the greater part has been thoroughly drained last year under the inspection of the Inclosure Commissioners; the timber and many of the hedges have been removed, and the land lies in large open fields; it is excellent wheat and bean land, but not of heavy tillage; most of it is fit for turnips; 15 acres of old pasture have been broken up this year, and the tenant will have the liberty to break up more. A good roomy Farm House, about 5 miles from the Hassocks Gate First Class station; only 7 miles from Brighton.—Apply to MR. HURLEY, Farm and Estate Agent, 62, Nelson-square, Blackfriars-road, London.

N.B.—Tenant may propose his own terms. Valuation very trifling.

Printed by WILLIAM BRADBURY, of No. 13 Upper Woburn-place, in the Parish of St. Pancras, and FREDERICK MULLETT EVANS, of No. 7, Church-row, Stoke Newington, both in the County of Middlesex, Printers, at their office in Lombard-street, in the Precinct of Whitefriars, in the City of London, and published by them at the Office, No. 5, Charles-street, in the parish of St. Paul's, Covent-garden, in the said county, where all Advertisements and Communications are to be ADDRESSED TO THE EDITOR.—SATURDAY, AUGUST 31, 1850.

WILLIAM DENYER, Seedsman and Florist,

82, Gracechurch-street, near the Spread Eagle, London.

N.B. Descriptive and Priced Catalogues can be had on application.

ROBERTS' STRAWBERRY TILES.—The following list of distinguished noblemen and gentlemen comprehends but a few, who have not only approved, but highly commended these Tiles; and also further confirmed their opinion of them, by giving second and third orders for more of them (in some instances amounting to above a thousand). To remove the doubts of the sceptical as to the merits of the above invention, the Patentee is permitted to make reference to the undermentioned, as well as some hundreds more, whose names will be forwarded, if required. A pamphlet, with further particulars, will be forwarded free on application (enclosing three postage stamps), to Mr. JOHN ROBERTS, merchant, 34, Eastcheap, London.

The Lord Bishop of London
His Grace the Duke of Buccleuch
His Grace the Duke of Rutland
The Earl of De La Warr
Sir Henry Dryden, Bart., Daventry
Sir Claude Scott, Bart., Guildford
Chas. Mills, Esq., Hillingdon
J. Ladbroke, Esq., Epsom
Charles Hoare, Esq., Dawlish
— Alexander, Esq., Ipswich
James Dunlop, Esq., Malton
W. Cotton, Esq., Leytonstone
F. Pilch, Esq., Ipswich
H. Langton, Esq., Peckham

And hundreds of others who have given these tiles a fair trial.

NOTICE TO "FAIR PLAY."—If "Fair Play" will give his name and address, and state where his garden is situate, I will pay him for the tiles on delivery to me, and also the loss sustained on his fruit, on proof from any respectable persons of his assertions being correct.

JOHN ROBERTS, 34, Eastcheap, London.

MESSRS. STANDISH AND NOBLE'S new descriptive CATALOGUE OF SELECT HARDY ORNAMENTAL PLANTS is just published, and may be had for four postage stamps. Besides a Treatise on the cultivation of American Plants, it contains a Plate and Description of the Funebral Cypress, Notices of Cephalotaxis Fortunii, Cryptomeria japonica, Quercus sclerophylla and inversa, Viburnum plicatum and macrocephalum, with many recent introductions from the north of China, quite new to English gardens.

Messrs. S. and N. take this opportunity of stating that they give Designs for Laying out New Grounds and Plans for Improvements; also Estimates for all kinds of Planting, whether ornamental or economic.—Bagshot Nurseries, Sept. 7.

WATERER'S DESCRIPTIVE CATALOGUE OF AMERICAN PLANTS, &c.

HOSEA WATERER begs to announce his new descriptive CATALOGUE OF AMERICAN PLANTS, CONIFERS, ROSES, &c., is just published, and may be had by enclosing two stamps for postage to HOSEA WATERER, Knap Hill Nursery, Woking, Surrey.

☞ Everybody who has any idea of planting the ensuing autumn should possess themselves of this Catalogue.

A LIST OF NEWLY INTRODUCED PLANTS NOW OFFERED FOR THE FIRST TIME BY JAMES VEITCH AND SON, EXETER:

Escallonia macrantha, 21*s.* each; one over to the Trade on three.

Ixora salicifolia, 21*s.* each; ditto.

Dipladenia urophylla, 21*s.* each; ditto.

Hoya coriacea, 10*s.* 6*d.* each; ditto.

Dipteracanthus spectabilis, 10*s* 6*d.* each; ditto.

Oxalis elegans, or Oxalis elegans major, 5*s.* each, or three for 10*s.* 6*d.* of either.

Calceolaria grandis, 5*s.* each, or three for 10*s.* 6*d.*

IXORA SALICIFOLIA (TRUE), WILLOW-LEAF IXORA.

MESSRS. VEITCH AND SON are now prepared to send out strong plants of the above beautiful and distinct IXORA, received by them from Java through Mr. Thos. Lobb. It is a lovely free-blooming species, flowering in a very young state, and at the Chiswick Exhibition in July last received the first prize for new and rare plants—the Silver Gilt Medal. It is figured and described in Curtis's "Botanical Magazine" for July last.

Strong well established plants 21*s.* each; one over to the Trade on three.—Exeter, Sept. 7.

ROSES.

EDWARD DENYER, NURSERYMAN, Loughborough-road, Brixton, near London, begs to inform Noblemen, Gentlemen, &c., that his superb collection of Autumnal Roses is now in full bloom. E. D. likewise invites an inspection of his unrivalled collection of Fruit Trees and Evergreen Shrubs, in quantities, of the finest growth. Orders taken for them at this time, and delivered in November next.

E. D. informs his friends that he has no seed shop in London.

"BRITANNIA" STRAWBERRY.

JAMES JACKSON, in offering his new seedling Strawberry BRITANNIA to the public, can with confidence recommend it to Gentlemen and Market Gardeners, as being a Strawberry that cannot fail to give general satisfaction, as it has a combination of excellent qualities not to be met with in any other at present in cultivation, being a very strong grower and an abundant bearer. It is as late as the Elton Pine, and much larger. It ripens well in any situation, and is of excellent flavour, and of a deep sea let colour. It grows a large size, and has generally six or eight fruit on one stem. Strong plants of this superb Strawberry will be ready in September at 4*l.* per 100.—Application to be made to JAMES JACKSON, Gardener, Marfleet-lane, Hull; Mr. M'INTOSH, Seedsman, &c., Hull; Mr. DANIELS, Hessle-road Nursery, near Hull; or to Mr. HAIRS, Seedsman, 109, St. Martin's-lane, London. As the stock is limited, early prepaid orders will be promptly attended to. The usual allowance to the Trade.

CHOICE FLOWER SEEDS for present and autumn sowing, free by post, with directions for sowing, treatment, &c. Descriptive Catalogues sent on application. The following, saved from large collections of new and choice varieties, each, per packet.

Remittances requested from unknown correspondents. Post office orders to be made payable to

BASS and BROWN, or to STEPHEN BROWN,

Seed and Horticultural Establishment, Sudbury, Suffolk.

HYACINTHS AND OTHER ROOTS.

RENDLE'S NEW PRICED CATALOGUE OF BULBOUS ROOTS

Is just published, and can be had on application, gratis.

It contains a *descriptive* List of all the best Hyacinths, Tulips, Iris, Ranunculus, Anemones, Crocus, Liliums, Gladiolus, Ixia, &c., with some excellent *cultural advice* as to the best method of growing them. It will be found of great service to all growers.

The "Collections of Seeds" sent out by us having given such universal satisfaction, we have been induced to offer the following "Collections of Roots," which we are certain will please every purchaser.

For the List of Roots contained in the Collections, see our new Book Catalogue.

COLLECTIONS OF BULBS.	£	*s.*	*d.*
No. 1 Collection, all the most approved sorts ...	3	0	0
No. 2 Collection, containing smaller quantities ...	2	0	0
No. 3 Collection, for a small Garden	1	0	0

For details of Collections, see below.

100 Hyacinths in 100 very fine sorts.	Purchaser's selection	3	0	0
100 Hyacinths in 50 fine sorts.	Purchaser's selection ...	2	10	0
50 Hyacinths in 50 superior sorts	ditto ...	1	10	0
50 Hyacinths in 25 superior sorts	ditto ...	1	5	0
24 Hyacinths in 12 superior varieties	ditto ...	0	12	0
12 Hyacinths in 12 superior varieties	ditto ...	0	6	0

Where the selection of Hyacinths is left to W. E. R. and Co., they request to be informed whether they are intended for water, pots, or the open ground; also whether single or double Hyacinths are preferred. When the choice is left to them they generally send about two-thirds double, and one-third single, which gives a greater variety. Purchasers may rely upon really good sorts being selected when the choice is left to ourselves, and we will guarantee to give them satisfaction.

For Catalogues, and further information, apply to

WILLIAM E. RENDLE AND Co.,

Seed Merchants, Plymouth.

N.B. Our Hyacinths and other roots have just arrived from Holland in excellent condition

TO ORNAMENTAL PLANTERS.

WHITLEY AND OSBORN respectfully beg to call attention to their PRICED CATALOGUE OF HARDY TREES AND SHRUBS for the ensuing season, which may be had on application to them at their Nursery, Fulham, near London.

N.B. If collections or large selections are taken, a deduction from the prices affixed would be made, and also when a large number of a sort are taken.

AMERICAN PLANTS.

JOHN WATERER'S CATALOGUE OF AMERICAN PLANTS, ROSES, CONIFERS, &c., is now published, and may be had gratis on application. It describes the colours of every Rhododendron worthy of cultivation, thus affording purchasers every facility in making selections.

American Nursery, Bagshot, Surrey.

EXHIBITION OF LILIUM LANCIFOLIUM, OR THE BEAUTIFUL JAPANESE LILY.

HENRY GROOM, CLAPHAM RISE, near LONDON, by Appointment FLORIST TO HER MAJESTY THE QUEEN, and to HIS MAJESTY THE KING OF SAXONY, begs to invite the Nobility, Gentry, and Public, to inspect his unrivalled collection of this most SPLENDID HARDY LILY, which is now in flower. For elegance of form, delicious fragrance, and freedom of flowering, it is not surpassed by any plant in cultivation. May be viewed every day (Sundays excepted). Admittance gratis.

MESSRS. VEITCH AND SON'S CATALOGUES OF NEW AND RARE PLANTS, STOVE AND GREENHOUSE PLANTS, GERANIUMS, AMERICAN PLANTS, &c., &c., are now ready, and can be had, on pre-paid application, by enclosing two postage stamps.—Exeter, Sept. 7.

NEW SEEDLING STRAWBERRY—MYATT'S "SURPRISE."—This is a variety raised from the British Queen, which it resembles, though of a more robust habit, and a very free bearer, producing a greater abundance of those large angular-shaped Strawberries than any other variety, and finishing off the last fruit of a good size, price 50*s.* per 100.

Also Myatt's Eleanor, 5*s.* British Queen, Globe, Mammoth, Comte de Paris, Hooper's Seedling, Keens' Seedling, Swanston's Seedling, Elton Pine, 3*s.* 6*d.* Fertilised Hautbois, 5*s.* Cuthill's Black Prince, 10*s.* 6*d.* per 100. Kitley's Goliah, 3*s.* 6*d.* per doz., or 20*s.* per 100.—Manor Farm, Deptford.

KITLEY'S GOLIAH STRAWBERRY. — The merits of this Strawberry are now so well known, as being hardy, large, fine in colour, a most excellent flavour, and forces well, that all parties who have seen it growing, or tasted the fruit, have expressed their entire satisfaction with it. This is the fifth season it has fruited in the same bed, and the plants are now perfectly healthy, and likely to continue much longer in bearing; the fruit this season have been as large and more abundant than from younger plants.

From the *Gardeners' Chronicle*.—"STRAWBERRIES: *J. K.* Your Seedling Strawberry, Goliah, judging from its size and appearence, is worthy of cultivation."

From the *Gardeners' and Farmer's Journal*.—"STRAWBERRIES. *J. K., Lyncombe Vale*.—We have great pleasure in bearing testimony to the exquisite flavour of your Seedling Strawberry, 'Goliah.' In our opinion, it combines the piquant flavour of the Strawberry with the richness of the Pine, the delicious aroma of which it partakes in equal proportion to taste. Apart from the Queen of Fruits, we certainly do not remember anything in this way that conveyed to our senses so delicious a treat as the noble fruit to be known to the world as 'KITLEY'S GOLIAH STRAWBERRY.'"

Strong well-rooted plants are now ready at 3*s.* 6*d.* per dozen, or 1*l.* per 100, on prepaid application only to JAMES KITLEY, Bath; Messrs. Low and Co., Clapton Nursery; Mr. J. G. Waite, Seedsman, 181, High Holborn, London; Messrs. Garraway, Mayes, and Co., Bristol; Messrs. Lucombe, Pince, and Co, Exeter; and Messrs. W. E. Rendle and Co., Plymouth.

Lyncombe Vale Nursery, Bath, Sept. 7.

BEAUTIFUL BOUQUETS OF FLOWERS may be preserved perfectly fresh and blooming, for several days, in GLASSES adapted for gentlemen's coat button-holes, any part of a lady's dress, the hand, or for plaiting into the hair; and are forwarded to any part of the Kingdom, post free, in a box containing one dozen of the various kinds, on the receipt of postage stamps value 2*s.* 6*d.*, by JACKSON and TOWNSON, 89, Bishopsgate-street Within, London.

THE BLACK PRINCE STRAWBERRY, now sending out at 10*s.* per 100.

Also PRACTICAL INSTRUCTIONS FOR THE CULTIVATION OF THE POTATO, containing the Competition Essay for the Prize of 1000 francs offered by the Belgian Government. Also Instructions on the Management of Asparagus, Seakale, Rhubarb, Vegetable Marrow, Scarlet Runner, Strawberry, Melon, and Cucumber; Chicory and Lamb Lettuce as Salads; the Lisianthus Russellianus, and the Tree Mignonette. The Destruction of Woodlice and Green-fly; and Peat Charcoal as a Manure. By JAMES CUTHILL, Horticulturist, Camberwell, London.—Printed for the Author, and sold by him only. Price 2*s.*; or, by post, 2*s.* 4*d.*

GRAPE VINES IN POTS FOR FORCING.

J. WEEKS AND CO., King's-road, Chelsea, beg to call attention to their splendid collection of Grape Vines, all struck from eyes, now two and three years old, the finest Plants that have ever been offered for Sale, consisting of 60 varieties, all of the best sorts, warranted true.

THE HAMBURGHS AND MUSCADINES being the best for early forcing in pots, this is the best time for Gardeners to have them, so as to get the eyes ripe and prominent. This Nursery is well worthy of a visit, as all modern Horticultural improvements are in full operation.

J. WEEKS and Co., King's-road, Chelsea.

HOLLYHOCKS.

H. LANE AND SON, Great Berkhampstead, Herts, have about 30 varieties of fine DOUBLE HOLLYHOCKS, without names, which can be depended upon as splendid sorts, at 6*s.* per dozen. They will be ready the end of September, and orders sent out in rotation as received.

BULBOUS FLOWER ROOTS CHEAP.
Carriage free, as see below.

The best sorts of fresh imported Hyacinths, Tulips, Irises, Gladioli, Anemones, Crocuses, Ranunculus, &c., may be had at much less than the usual prices, in valuable assortments, as under.

For particulars of the above assortments, see Messrs. SUTTON'S Priced Catalogue, just published, which may be had on application, inclosing one penny stamp, to JOHN SUTTON and SONS, Reading, Berks.

If Hyacinths only are required, Messrs. SUTTON'S best selection may be had at 10*s.* 6*d.* per dozen, with names and colours.

N.B. Parcels of not less than 10*s.* value are sent, carriage free, to any station on the Great Western, South-Western, or South-Eastern Railways, or to any office in London or Bristol.

HORTICULTURAL BUILDING AND HEATING BY HOT WATER.
WARRANTED BEST MATERIALS AND WORKMANSHIP AT THE LOWEST POSSIBLE PRICES.

J. WEEKS AND CO., King's-road, Chelsea, Horticultural Architects, Hothouse Builders, and Hot-water Apparatus Manufacturers. The Nobility and Gentry about to erect Horticultural buildings, or fix Hot-water Apparatus, will find at our Hothouse Works, King's-road, Chelsea, an extensive variety of Hothouses, Greenhouses, Conservatories, Pits, &c., erected, and in full operation, combining all modern improvements, so that a lady or gentleman can select the description of House best adapted for every required purpose.

THE HOT-WATER APPARATUSES (which are efficient and economical), are particularly worthy of attention, and are erected in all the Houses, Pits, &c., for both Top and Bottom Heat, and in constant operation in the Stoves.

The splendid collection of Stove and Greenhouse Plants are in the highest state of cultivation, and for sale at very low prices. Also a fine collection of strong Grape Vines in pots from eyes, all the best sorts.

Plans, Models, and Estimates of Horticultural Buildings; also Catalogues of Plants, Vines, Seeds, &c., forwarded on application.—J. WEEKS and Co., King's-road Chelsea London.

HOTHOUSES AND CONSERVATORIES made and fixed complete in all parts of the Kingdom, at a considerable reduction. One, two, and three-light Cucumber and Melon Boxes and Lights of all sizes, kept ready for use, packed, and sent to all parts of the Kingdom; warranted best material. Garden-lights of every description, at JAMES WATTS', Hothouse Builder, Claremont-place, Old Kent-road. Reference may be had to the Nobility, Gentry, and the Trade, in most of the counties in England.

CROWN, SHEET, AND ROUGH PLATE GLASS, FOR HOTHOUSES, CONSERVATORIES, &c.

The Improved Patent Rough Plate, made by Messrs. Hartley and Co., can be supplied from this Warehouse, of every size and substance, at the same prices as at the works.

100 and 200 feet cases of large Sheet Glass, from 2½*d.* per foot. Small ditto, 10*s.* 6*d.* per 100 feet, packed in boxes ready for immediate delivery. Curators of Botanical Societies, Florists, Railway Agents, and others requiring large quantities, will, on sending dimensions, receive estimates at the lowest prices.

GLASS MILK PANS, CREAM POTS, Lactometers, Bee Glasses, Fish Globes, and all kinds of Dairy Glass, Propagating Glasses, Hyacinth Dishes, Cucumber Tubes, and every other description of Garden Glasses.

PATENT GLASS PENS, self supplying, never blot, never soil the ruler, and will write continuously for 12 hours.

Also, Glass Rulers, Glass Inks for office-stands, desks, &c. Stationers and Schools supplied. Wholesale Warehouse for Ornamental Shades, Lamp Shades, Gas Glasses, Genuine White Lead, Paints, Colours, and Pumps for Farm purposes.

Our Catalogue of 18 folios is the most complete ever published. No Gardener or Farm Bailiff should be without one. May be had Gratis on sending two postage stamps to Messrs. COGAN and Co., 48, Leicester-square, London.

MITCHELL'S MINERAL BLACK PAINT.—This antiseptic Paint is intended for Park Fencing, and for all farming purposes; it is particularly adapted, by its prevention of dry rot in timber and repellance of damp, for Barns, Stables, Outhouses, Weather Boarding, Hop-poles; also for Carts, Waggons, &c., particularly the Wheels, and for Iron Hurdles, Iron Railings, and all Wood or Iron Work in exposed situations. For Brick Walls it is highly serviceable as a preventive of damp, and also for Walls intended for Fruit Trees, as, besides preserving the Wall, it increases the heat in all situations exposed to the sun, and prevents the harbouring of insects. It is also an excellent covering for Canvas, or Cart Tilts, Roofing, &c. Sold in casks containing from 1 cwt. to any quantity, at 17*s.* 6*d.* per cwt., quite ready for use, by

JAMES PHILLIPS and Co. (the sole agents), 116, Bishopsgate-street, Without, London.

HARTLEY'S PATENT ROUGH PLATE GLASS.

JAMES PHILLIPS AND CO., 116, Bishopsgate-street Without, beg to hand their list of Prices of the above description of GLASS.

OLD FEATHER BEDS RE-DRESSED, AND PURIFIED BY STEAM WITH PATENT MACHINERY.—This new process of dressing not only removes all impurities, but by expanding the feathers the bulk is greatly increased, and consequently the bed rendered much fuller and softer.—Charge for dressing, 3*d.* per lb. Old and Mothy Mattresses effectually cured and removed, fetched and returned, carriage free, within five miles.—HEAL and Son's List of Bedding, containing full particulars of weights, sizes, and prices, sent free by post on application to their factory, 196 (opposite the chapel), Tottenham-court-road, London.

GLASS FOR CONSERVATORIES, HORTICULTURAL PURPOSES, &c.

T. MILLINGTON'S SHEET GLASS, which is of the best description, varying from 16 to 32 ounces, at from 2*d.* per foot and upwards; 100 feet and 200 feet cases of large Sheet Glass, for cutting up, at 2½*d.* per foot. British Plate Glass, from 1*s.* 2*d.* to 2*s.* per foot, according to size. Patent Rough Plate Glass, from ¼ to 1 inch in thickness, from 4*d.* per foot upwards. Glass Slates and Tiles. Milk Pans from 12 to 24 inches diameter, from 2*s.* to 5*s.* each Cucumber Tubes, from 12 to 24 inches long, at 1*d.* per inch. Lactometers, 7*s.* 6*d.* each. Wasp Traps.—Lists may be had, on application at the Warehouse, 87, Bishopsgate-street Without, same side as the Eastern Counties Railway.

WANTED, ALEXANDER RUSSELL, a Gentleman's Gardener, formerly in the employ of Geo. Robins, Esq., then in the service of E. Brande, Esq., of Turnhamgreen; then with Lord Lonsdale, of Barnes, Surrey; and latterly with — Lumley, Esq., "the Chancellor's," Hammersmith. The said ALEXANDER RUSSELL is a native of Scotland, speaks with a broad Scotch accent, is about 55 years of age, 5 feet 4 or 5 inches in height, round shoulders, with a downcast look, and red whiskers. Information as to his place of residence (if living), or place of burial (if dead), to H. F., at Mr. Luff's, Boot-maker, Kew, Surrey, will be handsomely rewarded.

YARMOUTH BLOATERS.—GENUINE AND OF THE FINEST QUALITY.

Yarmouth has for centuries been justly celebrated for its well-known "Yarmouth Bloaters," the delicacy of which, when obtained in their genuine state, requires no comment. Such an opportunity is now offered; and they can be forwarded to any part of the kingdom (on receipt of a post-office order), at 10*s.* per 100, or 6*s.* per 50 (package included).—All orders to be addressed to Mr. FREDERICK BROUGHTON YOUELL, Church-square, Great Yarmouth.

PIMLICO SLATE WORKS.—Cisterns, Filters, Milk and Salting vessels, Corn and Flour Chests, Sinks, Dairy and Larder Shelves, Malting and other Flooring, Skirting, Refrigerators, Garden Edging, Flower Boxes, Pine pit Linings, Hot-bed Frames, moveable Cattle Sheds, Coping, Drain Stones and Traps, Steps and Risers, Balcony Landings, Roofing Slates, ridge roll and flap; Waste Slate for drains, Sun Dials, Fountains, and all descriptions of plain Slate Work in Town, or direct from Mr. MAGNUS'S Works in North Wales.

ENAMELLED SLATE Chimney-pieces, Billiard Tables, Console and other Table Tops, Mural Tablets, &c., in imitation of marble, surpassing the choicest marbles in beauty and durability, at less than half the cost of the commonest descriptions. Price Lists forwarded on application to Mr. MAGNUS, 39 and 40, Upper Belgrave-place, London.

BAKER'S PHEASANTRY, Beaufort-street, King's-road, Chelsea, by special appointment to her Majesty and H. R. H. Prince Albert.—ORNAMENTAL WATER FOWL, consisting of black and white swans, Egyptian, Canada, China, barnacle, brent, and laughing geese, shieldrakes, pintail, widgeon, summer and winter teal, gadwall, Labrador, shovellers, gold-eyed and dun divers, Carolina ducks, &c., domesticated and pinioned; also Spanish, Cochin China, Malay, Poland, Surrey, and Dorking fowls; white, Japan, pied, and common pea-fowl, and pure China pigs; and at 3, Half-moon-passage, Gracechurch-street, London.

THE BLOOD.—Our bodies have been entirely formed, *are now forming, and will continue to be built up during life from the blood. What the sap is to the tree the blood is to the animal frame; and inasmuch as the strength and verdure of a tree are dependant on the moisture derived from the root, the health and vigour of the body are indispensably connected with a pure and free circulation of this important fluid. It is this that must feed the flame of existence; and unless its replenishments are freely and purely communicated, the vital fire becomes clouded, burns dimly, and is ultimately extinguished. The grand object is to keep this precious fluid (the blood) in a pure and healthy state, for without this purity, disease will show itself in some way or other.*

PARR'S LIFE PILLS.

It is universally admitted that this medicine will purify the blood better than any other, and will conquer any disease.

None are genuine unless the words "PARR'S LIFE PILLS" are in WHITE LETTERS on a RED GROUND, on the Government stamp, pasted round each box; also the fac-simile of the signature of the Proprietors, "T. ROBERTS and Co., Crane-court, Fleet-street, London," on the directions.—Sold in boxes at 1*s.* 1½*d.*, 2*s.* 9*d.*, and family packets at 11*s.* each, by all respectable medicine vendors throughout the world.

IMPORTANT INFORMATION.

DR. ROBERTS'S celebrated OINTMENT called the POOR MAN'S FRIEND, is confidently recommended to the Public as an unfailing remedy for wounds of every description, a certain cure for ulcerated sore legs (if of 20 years' standing), cuts, burns, scalds, bruises, chilblains, scorbutic eruptions and pimples in the face, sore and inflamed eyes, sore heads, sore breasts, piles, fistula, and cancerous humours, and is a specific for those afflicting eruptions that sometimes follow vaccination. Sold in pots at 1*s.* 1½*d.* and 2*s.* 9*d.* each. Also his PILULÆ ANTI-SCROPHULÆ; confirmed, by more than 40 years' experience, to be without exception one of the best alterative medicines ever compounded for purifying the blood and assisting Nature in all her operations: hence they are useful in scrofula, scorbutic complaints, glandular swellings (particularly those of the neck, &c.) They form a mild and superior family aperient, that may be taken at all times without confinement or change of diet. Sold in boxes at 1*s.* 1½*d.*, 2*s.* 9*d.*, 4*s.* 6*d.*, 11*s.*, and 22*s.* each.—Sold wholesale by the proprietors, BEACH and BARNICOTT, at their Dispensary, Bridport, and by the London Houses; and retail, by all respectable Medicine Vendors in the United Kingdom.

ANOTHER EXTRAORDINARY CURE OF A WOUND IN THE LEG BY HOLLOWAY'S OINTMENT AND PILLS.—Andrew Milton, Ostler, residing at Barton, about two years ago, bruised his shin, and being of a full habit of body, a severe inflammation ensued, which defied every effort to subdue; afterwards, an obstinate wound formed, and notwithstanding various treatments, it would not heal, and his leg became so bad that his surgeon urged him to have it amputated; but not wishing to lose his limb before giving HOLLOWAY'S Medicine a trial, he commenced, and he has reason to be grateful that he did, for by their use he has effected a sound and perfect cure.—Sold by all Druggists, and at Professor HOLLOWAY'S Establishment, 244, Strand, London.

FIRST CLASS SEEDLING GERANIUM.

RUNDLE'S BEAUTY OF MONTPELLIER.—This beautiful flower was exhibited at the Chiswick Horticultural Fete, May 18, 1850, and was very much admired, and was also noticed by all the leading publications; a description of which will be found in the *Gardeners' Chronicle*, by Professor LINDLEY; in the "Florist," by Mr. Beck; and in the "Gardeners' Magazine of Botany," by Mr. Glenny; all of whom speak in the highest terms of praise. Two Seedling Plants were also exhibited at the Royal Devon and Cornwall Horticultural Show, two days previous to the Chiswick Show, and won a Seedling Prize. It was noticed by the editor of the *Plymouth Herald*, and as it gives a good description of it we extract it.

"One of the principal attractions at the Show was a magnificent Seedling Geranium, raised by William Rundle, Esq., Montpellier House, Devonport, and for which an extra prize was awarded. It attracted the attention of every florist, and was undoubtedly one of the best flowers in the room. The ground colour is a bright pink, with a *pure white centre*, extending over one-third of the upper petals. It has a rich and velvety crimson maroon spot, beautifully tinted, and shaded off to the ground colour. It is an extra-sized flower, of good shape and substance, like Lyne's celebrated flower, *Forget-Me-Not*. In fact, it has very much the habit of this sterling flower, being of a short, robust growth, and throws its fine flowers well above the foliage."

Further description would be unnecessary, more than for us to say, that we are certain it will give the most complete satisfaction to every customer, and we can recommend it with the same confidence that we introduced Lyne's *Duke of Cornwall, Forget-Me-Not*, and Arnold's *Virgin Queen*. *These are all sterling flowers and are much admired even at the present day.*

Price 20s. each. One given over three to the trade.

Good strong plants will be ready about the middle of October. Apply to WILLIAM E. RENDLE and Co., Nurserymen, Plymouth.

Our new descriptive Catalogue of Geraniums, Azaleas, Camelliss, Fuchsias, &c., is just published, and can be had on application for one penny stamp.

SEEDS FOR PRESENT SOWING.

JOHN CATTELL has new seeds of the undernamed, now ready to send out in packets (postage free), at the prices annexed.

CALCEOLARIA, fine impregnated, warranted to give a good variety of sorts, with directions for their culture, 2*s.* 6*d.*

GERANIUM, from new kinds, sent out last year, of florist and fancy varieties, separate, or half of each, at the purchaser's option, 18 seeds, 2*s.* 6*d.*

GERANIUM, from scented sorts, 6*d.*

New spotted NEMOPHILA MACULATA, 6*d.* Old sorts, ditto, 3*d.* SCHIZANTHUS RETUSUS, 6*d.*

RHODANTHE MANGLESII, 1*s.*

Bulbs of Tropæolum brachyceras and tricolorum grandiflorum, worth the attention of the trade. Remittances to accompany orders from unknown correspondents.

Westerham, Kent.

BECK'S SEEDLING PELARGONIUMS.—No more remittances can be received for ROSA or SILK MERCER, as all the present stock is engaged.

Catalogues may be had on application to J. DOBSON, enclosing a stamp.—Worton Cottage, Isleworth, Sept. 7.

EXOTIC NURSERY, KING'S ROAD, CHELSEA.

MESSRS. KNIGHT AND PERRY have great pleasure in soliciting the attention of their Patrons to their NEW LABURNUM, L. autumnale, which, from its peculiar property of flowering profusely at this season, and continuing in bloom throughout the autumn, must be considered one of the most important as well as most beautiful acquisitions that has been made. It may now be seen in full flower at the Nursery.

They also respectfully invite an inspection of their healthy stock, free from insect, of FRUIT TREES, trained and untrained, which (combining the advantages of unusually elaborate attention to their culture, both in root and branch, with a particular method of labelling, to ensure the accuracy of the kind) are very excellent and cannot fail to afford complete satisfaction wherever supplied.

They likewise beg to observe that their Stock of VINES, raised from eyes obtained from the fruiting plants of the most celebrated growers in the country, is larger than ordinary, and of first-rate excellence.

SUPERB HOLLYHOCKS.

J. CHATER AND SON beg to announce that their New Descriptive Catalogue of the above flower is now ready, and can be had by enclosing a postage stamp.

Also, Choice Pansy Seed, 1*s.* per packet.

Nursery, Haverhill, Suffolk.

SLATE WORKS, ISLEWORTH, MIDDLESEX.

EDWARD BECK Manufactures in Slate a variety of articles for Horticultural purposes, all of which may be seen in use at Worton Cottage, on application to the Gardener, Sundays excepted. Priced lists of plant tubs and boxes forwarded on application.

The Gardeners' Chronicle.

SATURDAY, SEPTEMBER 7, 1850.

MEETINGS FOR THE ENSUING WEEK.

COUNTRY SHOWS.—Tuesday, Sept. 10: Hampshire Horticultural, and Shacklewell Dahlia.—Wednesday, Sept. 11: Manchester Botanical and Horticultural, Glasgow West of Scotland Horticultural, and Berkshire Horticultural.—Thursday, Sept. 12: Salhouse Village Horticultural, and Bath Horticultural.—Friday, Sept. 13: Darlington Horticultural.

WE have little conception in this country of the cold which the ORANGE TREE is capable of enduring, and we never think of trusting it in winter to any less effectual protection than a solid brick building warmed by artificial means. Nevertheless it is certain that on the Continent the trees are preserved by simpler shelter through winters to whose severity we have nothing to compare. It is related that upon reopening an hotel in Paris, which had been closed during two years, at the time of the great Revolution, it was found that part of the Orange trees left in the hibernatory without water or artificial warmth of any kind were still alive.

The other day, upon turning over some old letters, we found one dated Dec. 11, 1837, from the late Sir AUGUSTUS FOSTER, which puts the hardiness of the Orange tree in a still stronger light. Writing from Genoa, he says:

"Being under the impression that single Orange or Lemon-trees, or rows and groups of Orange or Lemon-trees might with care be brought to grow out of the ground in England like other plants, I have thought it might be worth while to mention to you the success which has now for several years attended a plantation that I made of seven Orange-trees in a much colder climate, in the garden of my country residence, on the hill of Turin, facing the highest range of the Alps. I was led to make the experiment from having by accident in the first year of my arrival at Turin, seen the way in which the Orange-trees in boxes were treated in the cellars of a Piedmontese nobleman's house during winter, where they were placed for several months, without light, or heat, or water, and exposed to severe cold, which almost every winter reaches to —12° or even —16° of REAUMUR's thermometer (+5° to —4° FAHR.). My group of Orange-trees were taken out of boxes, and planted in earth prepared for the purpose, in the year 1826. In the very severe winter of 1828-9, three of them perished, but not of the cold so much as the damp, for they were examined, and seen to be still safe in February, after the frost had reached above 15° of REAUMUR (—2° FAHR.), and perished a few days later from a return of the cold, attended by the drippings of a previous thaw. I had the three which died replaced, and from that time to this they have flourished and increased in size. I have them covered with a round cabin of planks, roofed with straw on the outside, at the end of October or beginning of November, and uncovered in April. They bear abundance of Oranges and Lemons, the former occasionally becoming eatable with sugar. At no other place in this country am I aware that the experiment has been tried, unprotected by a wall. But with a wall and a covering of wood and straw, to be taken off in the summer, I can scarcely doubt that the plants might be made to grow, without the clumsy accompaniment of large wooden boxes, in an English garden."

These statements afford abundant materials for speculation. They establish beyond all doubt the fact that in the north of Italy the Orange tree bears a degree of winter cold unknown in England. For this it is prepared by the complete ripeness of its wood, a state to which it will not arrive in this climate in the open air. But are we therefore to infer that it will not live with much less shelter than it now receives? Such an inference is so little justified by other well-known facts, that we submit to those who have Orange trees at their command the probability of their surviving the winter in barns, or dry out-houses, or under wooden screens where no artificial heating is applicable. Dryness in such an experiment is the first condition to secure; darkness is the second. The Orange tree will bear to be deprived of water during the whole of its season of rest, provided its roots are kept in the earth they grew in; how much dryness, beyond this, they will bear, is shown by the long exposure to the air which they undergo in the shops of the Italian warehousemen in London; and experience tells us that the effect of cold upon plants is feeble in direct proportion to their dryness. All trees kept in the dark, or at least kept where no sun can shine upon them, will bear without injury a degree of cold which would be fatal to them if exposed, when frozen, to the direct rays of the sun. Camellias, Chinese Azaleas, Indian Rhododendrons, and many New Holland plants, take no harm in cold pits in winter, provided those pits face the north. Some of them live out of doors perfectly well during winter, if under north walls. Why not the Orange also? It may be, indeed, that its constitution has some peculiarity that unfits it, more than the plants just named, for bearing severe cold; but that is completely negatived by Sir AUGUSTUS FOSTER's statement. We therefore regard the experiment of wintering Orange trees in cold houses, where the sun is excluded, as one offering reasonable chance of success. We shall test it ourselves, and would recommend it to others.

There is another part of the foregoing letter to which we cannot so readily assent. It is suggested that Orange trees on walls, properly sheltered, may be made to grow in the open ground. That we much doubt, unless upon raised borders, which shall be made to receive all the heat which air and solar rays can communicate. Cold as the winter may be in Piedmont, the summers are hot in proportion; and the earth must have a very different temperature from that of England. The mean temperature of Genoa in August is 75.92°, that of London is only 62.18°; and if we take these to indicate the temperature of the soil at a foot below the surface, we shall find more than 13 degrees of heat against us—a very large and important difference, for which we can provide no natural compensation. The success of planting Orange trees in the open ground, as Peach trees are planted, is therefore very problematical.

If the attempt is to be made, we would suggest that the border should be quite *above* the ground level, and placed upon a solid floor of concrete or pavement. It may be also a question whether some important gain would not be effected by fixing over the sloping border sheets of pierced zinc painted black. This is however a contrivance of which there is no other experience than what Mr. WILLIAMS gained at Pitmaston in Melon growing; and therefore we do not insist upon it.

SOME time since our attention was called to a curious case of hypertrophy in a crop of Peas observed by Dr. DICKIE, in the county of Aberdeen, and a somewhat similar case occurred last year in the great conservatory at Kew, on the leaves of more than one species of *Pleroma*. In the former case bodies, probably due to incipient fermentation, resembling the yeast fungus, were present; in the latter no such bodies were observed. But in an eruptive disease on the leaves of *Eranthemum pulchellum*, lately transmitted by one of our correspondents, where the external appearance is almost identical, the presence of a well-formed fungus is beyond all doubt. The under side of the leaves is spotted with little pale dirty white, or fawn-coloured pustules, which exhibit at first a cellular structure, and appear to be in that state a mere exuberant growth of the cellular tissue of the leaf, containing no trace of filaments, or anything like fructification. It is not, however, clear, when the further history of these pustules is taken into consideration, that they are really an altered state of the cells, and not a cellular tissue proper to the parasite; because not only is the stroma of many *Sphæriæ* distinctly and closely cellular, but even where no visible stroma exists, as, for instance, in *Sphæria herbarum*, the early stage of growth before any fructification is formed, exhibits simply a mass of cells, and as it approaches maturity the central cells are absorbed, while asci are developed from those near the walls. In a very curious genus, lately communicated by Dr. MONTAGNE, after the absorption of the central cells, the basal cells are transformed into spores, as in some Algæ.

In the production before us, the whole pustule is at first shapeless, and confused with the tissue of the matrix. After a time however the surface is rough, with a greater or less number of points, reduced rarely to one or two, which are the ostioles of so many perithecia. There are no asci, but myriads of very minute subelliptic spores are produced on short delicate sporophores, without any trace of asci. The fungus is therefore a Sphæronema, taking the genus in a certain degree of latitude; and it is very possible that at a certain stage of growth the spores ooze out, forming a globule or cirrhus at the tip of the ostiole, a circumstance dependent entirely on the degree to which the perithecia are susceptible of collapsion. Not having seen specimens in their place of growth, we cannot state positively that the case is so. For the same reason it is impossible to affirm what is the predisposing cause of the production of the parasite—which not only disfigures the leaves, but makes the flowers droop and turn brown before they are well expanded—or to suggest any remedy. The only parties capable of doing so are those who can watch its growth; and when once the real nature of the substance is ascertained, their observations, if made with care and tolerable acuteness, will be worth a thousand times more than any speculations in the closet. It is a cheering fact that the cultivator's eye is turned to every anomalous appearance, because it shows an increase of intelligence, and the very act of inquiry and expectation of a reply keeps the faculties on the alert, and stimulates to further observation. We would, however, strongly urge the wisdom of not leaning entirely upon others, but trusting a little as well to native powers of observation. It is well to know whether any anomalous appearance is due to a fungus or insect, or whether it is some diseased affection produced by outward conditions, or by innate constitutional weakness. But these points being ascertained, it is to the first observer of the affection that we may justly look for available information.

The species being undescribed may be characterised as follows: *Sphæronema deformans;* parasitic on living leaves; perithecia oblong, growing several together from a pallid pustule, which is rough with the free ostioles; spores minute subelliptic. *M.J.B.*

HOW TO MISMANAGE A GARDEN.

CHAPTER V.—It would be a great injustice to mismanagement if it were limited to withholding manure. The possession of that article is often as useful to the mismanager as the want of it.

A man who has nothing but good management to recommend him takes many precautions to secure manure in different states, and to apply it in a particular manner. He has his strong manure for Cabbages and Asparagus, his mild manure for flowering plants, his liquid manure for little delicate creatures. He attaches importance to the time when it is applied, and the manner, and the quantity. Nothing can be more fanciful than his mode of dealing with

it. If he has a tap-rooted crop to bring on he puts it deep in the trench under the seed; if he has a leaf crop he lightly forks it in.

A mismanaging genius despises all this; he finds no occasion for distinguishing what is strong from what is weak; manure is manure, and what is good for a Rose is good for a Geranium. As for the time of using it, why any time will do; if too late, it will do the plants no harm to wait; if too soon, at all events it is ready for them when they do want it. "Manure can't be wasted"—that is his maxim. It may as well be in the soil as anywhere else; and that is true, for if a crop is not ready to feed upon it, it is pretty certain that weeds enough will spring up to assist in its consumption.

Of all the "fancies" which the mismanager despises most, is that of putting manure into the bottom of trenches under the seed of tap-rooted plants; for how is manure to do the seed any good if so far away from it? The mismanager therefore puts it on the top; a plan which among other merits has this—that you can see it, and see what becomes of it. It is true that the genius generally finds his Carrots and Parsnips all forks and fibres, while the manager has roots as straight and as long as a foot rule; but then it is not the way of manuring that makes the difference; it is all the fault of the soil.

A dull-witted gardener, who uses liquid manure, gives it to his plants day by day, as they grow, a little at a time, and very weak; it is astonishing how much trouble he takes with his patients; one would think that he was feeding his children. The bold practitioner, on the other hand, proud of his mismanagement, drenches his plants with "good strong stuff;" one watering is enough for him; and pretty often enough for his plants, unless, indeed, he administers it when they are at rest, and then maybe it will be washed away from the roots before it can do any harm, especially if the plants are in pots.

In no department of his art does the talent of another sort of mismanager appear more conspicuous than in his application of manure. He finds it gives greenness and vigour to his Vines and Pear trees; he sees his yellow lawn speedily darkened by its invigorating influence; and he infers that so likewise his pallid Conifers, cramped in pots, or steeped in a bog, will soon be restored to the bright green colour for which they are valued. It happens, indeed, that they become yellower than before, and probably die outright; but it cannot be the manure that did it; some good-for-nothing fellow has poisoned the trees.

But the triumph of skill, with the mismanager, is his preparation of his manure. He gets stable litter, and throws it in a heap, treads it well, and leaves it till its inside is as full of ashes as an Apple of Sodom; he lets it heat well, to drive the rankness out; and leaves it exposed to rain, in order that it may be kept well together; he cuts a trench round it, to drain off the water; and when at last he has a pile of nice black, scentless matter, his operation is perfect. It has been observed, indeed, that, in gardens where this kind of manure is employed, the crops are not nearly so good as in places where another system is followed; but that is evidently because of the hungry soil which the mismanager has to work. He takes credit to himself for getting something in such a place; and well he may, all things considered.

In purchasing ready-made manure, a genius is still conspicuous. To strengthen that which is home-made, in the manner described, it is advisable to buy some guano, a capital material, which seems to suit all sorts of crops. But it is so troublesome to send to the county town for it, the penny post is so expensive, that he puts off ordering it till the season is well nigh gone. By great good luck, a very respectable gentleman gives the genius a call, for the express purpose of saying that he has brought a lot of guano to a railway station close by; price very low, quality capital, the sample is beautiful; it is not half so strong smelling as what his neighbour bought at twice the price. Of course, the mismanager, eager to save his master's money, and his own trouble, makes a bargain with the civil gentleman, and is supplied on the spot. Somehow or other, however, it turns out that the guano does not do much good; he can't see, after all, where it was put; it is plain that it doesn't suit his land, and he sagely determines to have no more of it. As for the garden on the other side the road, where such an amazing crop of Beet was had where the guano was put on, that is no rule; because everything seems, somehow, to grow well there. *Κῆπουρος.*

GARDENS IN HOLLAND.

Having been engaged by a Dutch nobleman of Brabant to arrange his gardens, I had an opportunity of looking over the crops of that district, and subsequently of those of Holland, visiting Mr. Van Houtte's establishment at Ghent, the Leyden Botanic Garden, and also of being present at the sale of plants belonging to his late Majesty, at the Hague. This ground has been gone over so frequently, and even recently by that acute amateur "Dodman," that I have but little hope of adding anything new, nevertheless the impressions formed by different writers ought to be compared, to enable those who stay at home to form a judgment of the practices of their neighbours, and to improve upon our own, where practicable. Having watched the Potato disease carefully in my own grounds, and that of my neighbours in the county (Kent), I was most anxious, upon landing at Ostend, to mark what difference, if any, existed in the state of the plant, as it regarded period of attack, variety of sort, or effect of change of soil. At a glance I perceived that the disease was more forward than I had a few hours before left it upon our own coast; for I did not see one plant with a green leaf, either then or subsequently in a run of 200 miles. At first the persons I inquired of said that the tubers were uninjured, it would only lessen the crop by contracting their size; and thus for a few days they were buoyed up by illusory hope, soon, however, to know how fallacious were their dreams; the fatal truth became too apparent, the disease of stem and leaves had infected the winter store. Judging from what I saw, not more than one-third of a crop can be reckoned upon at this time, with the chances that more would decay. Some of the most active were digging them up and shipping them off; and so hastily was this going on, that a field was dug in panes and then ploughed before the intervening portions were dug up. Cabbages and Broccolies were planted and Turnips were sown, the land having been previously manured.

The labourers of Holland do not so immediately depend upon Potatoes as ours do for a winter's store, for they eat salted Cucumbers, Cabbages, French Beans, and even Peas and Beans, all of which are put into tubs or large earthen vessels and weighted down with boards having stones for weights placed upon them. In this pickle the vegetables ferment, and the scum is carefully taken off at least twice a week, which appears to be all that is requisite. On these pickled vegetables they feed when the garden crops have mostly passed away. But it is curious to see how differently the Dutch labourer feeds now to our own. I saw many purchasing salted Cucumbers and Beets, and a cut of bread (black Rye-bread), on which they dined. Some, indulging in a little more luxury, added one or two eggs boiled hard. Meat in any form seems little used, and my friends told me, it would not be difficult to find many persons of mature age who had never tasted it. But Cucumbers, Carrots, Turnips, Cabbage, Lettuce, and Onions seem the staple articles of consumption during summer. Happy would it be if our Irish peasants would adopt a similar habit; it would make them more industrious, and wholly avert the horrors of famine. In other respects the Dutch are worthy of our imitation, for they do not try to grow crops for which their land is unfitted. If the Dutch farmer sought compensation for growing Wheat, wheaten flour must be at an enormous price; but he prudently grows Oats, Rye, and Buckwheat instead, for all of which his sandy land is appropriate. Then, as the cattle are housed in winter, an abundant supply of Turnips, Mangold Wurzel, and Clover is prepared for them. The pasturage about Schiedam, and for many miles around it, is of the very finest description, giving food to thousands of the finest black cattle I have ever seen. They have a practice here also of feeding them from tubs, containing grains after they have passed from the distillery, which no doubt adds much to their healthy appearance.

This is not the place to talk of pictures, although one passing remark upon the celebrated bull of Paul Potter may be allowed. This, as all the world knows, is a marvel of art, and as such stands unrivalled to the present day. But let us look at the breed, and compare it with those living animals of which I have just spoken, and truly we may say, "if the painter's art could no further go," the grazier's could, and the result is obvious to the spectator and profitable to the proprietor.

Except in the woods of the Hague and at those of Haarlem there are literally no large trees, although the woods are lined on each side by long avenues of Poplars and Willow Pollards, "such as the Flemish painter loves." But the Oak and Beech thrive here marvellously, attaining more growth in 20 years than ours do in 30. Their management of copses differs from our own. It seems that the inspector pays annual visits, and directs which are fit to cut down. This cutting usually takes place every six years, but wherever an Oak has been planted it is left till 12, and so comes in at the alternate falls. This is done for the maiden bark, which is stripped, cut into short lengths, and packed in bags chiefly for the English market. Whilst speaking of trees, it may be well to notice a practice the Dutch gardener has in the removal of large trees, whether of Oak, Beech, Elm, Poplar, or Lime, and which seems to answer well—namely, that of pruning all the branches off close to the stem; so that if you purchase trees with good handsome heads in the nurseries, when you receive them they are branchless, and perhaps 20 feet high. I noted those that had recently been planted, and could but remark how large a portion has taken root-hold. Many acres of blowing sand have been planted with Scotch Pines and Spruce Fir, with here and there a patch of Pinaster and Taurian Pine. The trees thrive well at first, but as thinning is wholly neglected, in a few years the whole have to be cut down, there not being a tree on an acre fit to form timber. I have frequently regretted that many plantations I had formed as a youth have been suffered to go to ruin, but here the practice is universal.

In looking over the gardens of the gentry I could but remark that the taste for curious trees appeared to be of earlier date than with us, for in many situations on a minor scale (not like our Syon House), were large trees of variegated Oaks, and others that had been grafted, and which now were goodly timber. The paucity of shrubs and evergreens was very remarkable, and the gardeners tell us that they will not live in their climate; but this is not so, for I found flowering shrubs, and even Rhododendron, Box, Holly, Bay, and Laurestine where they had been properly introduced. The reason of failure is, that they attempt to make them grow under large trees that have been thickly planted. Failing in this, the gardeners have recourse to young forest trees, and it is no uncommon thing to see a garden laid out in what they call English style, where the beds are wholly composed of young Oaks, Acacias, Hornbeams, or Beeches, under the large trees, and where, according to our notions, Lilacs, Syringas, &c., would have been more appropriate. In any one garden I visited I never saw a Magnolia; but the Tulip trees are of beauty far beyond the average of our own in foliage, and they flower profusely.

In the fruit tree department we have nothing to learn—our wall trees are generally better trained than theirs. Peaches and Nectarines are grown upon reed fences with wooden copings, and I did not see any novelty in the training of the Apples, Plums, or Pears.

In the kitchen gardens that I saw, more care appeared to be bestowed upon the culture of Carrots, for there were generally not less than six sowings of the Horn variety, so that they insure a plentiful supply of young ones the whole summer. The varieties of French Beans were grown more luxuriantly than with us; indeed, at first, I mistook them for Hops. The white Cucumber seems much to be preferred to the green, and I could imagine the horror of an English gardener, if placed with a Dutch one as a censor at a show. On the sandy lands the gardeners are saved much anxiety, for slugs and worms are wholly unknown. As the disease on Grape Vines has become so prevalent in the south-eastern districts of England, I was careful to inquire if it was known here; but I nowhere saw a vestige of it, either on those grown in the open air or under glass. A fellow traveller told me it had destroyed many vineyards in the Rhineland. In a short time, if it is deemed worthy, I will continue my remarks upon Van Houtte's nursery, the Leyden Botanic Garden, and the plants of his late Majesty of Holland. *William Masters, Exotic Nursery, Canterbury, August* 10.

[We are sure that our readers will be greatly obliged to our intelligent correspondent for as much more information as he may be willing to favour them with.]

BRITISH ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.

Thursday, *Aug.* 1.—Section D.—*On the Per-centage of Nitrogen as an Index to the nutritive Value of Food,* by Dr. A. Voelcker.—The object of this paper was to show that the usual estimation of the nutritive qualities of an article of food is frequently attended with inaccuracies, which renders it desirable to modify our present methods in this respect in many cases. A circumstance which leads to considerable error is, the presence of ammoniacal salts in the juices of plants. In order to prove experimentally the presence of ammoniacal salts in larger quantities than hitherto suspected, and to avoid the objection that they might result from a partial decomposition of albuminous substances during the analysis, the author chose fungi for his experiments, which are rich in nitrogen and known as being highly nutritious. The species used was Agaricus prunellus, a species which is edible, and remarkable for forming most beautiful fairy rings. After having separated all soluble protein compounds by means of basic acetate of lead, which re-agent throws down these completely, the amount of nitrogen still present in the juice of these Agarics, in the form of ammoniacal salts, was found to be 0.204 per cent. for the fresh fungi, or 1.82 per cent. for the dry fungi. The whole amount of nitrogen in the same Agarics, collected at the same time, determined by combustion, was found to be 0.74 per cent. for the fresh fungi, or 6.61 per cent. for the fungi dried at 212° Fahr. Deducting from the last stated numbers the quantity of nitrogen found to exist in the juice in the form of ammonia, we find that only 0.536 per cent. of nitrogen in the fresh, or 4.799 per cent. of nitrogen in the dry fungi, exists in the state of protein compounds, and that nearly one-third of the nitrogen obtained by direct combustion exists in the form of ammonia in the juice, or at all events in a form in which the nitrogen adds nothing to the nutritive value of the fungi. The nutritive value of fungi has thus been overrated considerably; and there can be little doubt that the same is the case with many vegetables, which, according to the author's experiments, contain sometimes considerable quantities of ammonia in the form of ammoniacal salts.—Dr. Christison remarked that he had long been convinced that there was a considerable fallacy in the methods of determining the value of nitrogen, and he hoped Dr. Voelcker's communication would direct inquiry in a more satisfactory direction.—Dr. Daubeny made some observations on this paper; and particularly noticed the researches of Prof. Hoffman on the substitution of ammonia, or of its elements, for carbon, which it appeared to him pointed

to some laws in connection with the processes of assimilation of nitrogenous materials by growing vegetables.—Dr. R. D. Thomson offered some objections to the reception of the doctrine that nitrogen was the principal source of nutrition, since it is found that blood and the other animal constituents contain many other substances.—Dr. L. Playfair was pleased that Dr. Voelcker had pointed out a source of error in the determination of nitrogen. Having been engaged in examining the dietaries of a large number of extensive establishments, he should lay the results before the meeting.

VILLA AND SUBURBAN GARDENING.

The kind of soil which suits one sort of vegetable is often unsuitable for another. Carrots, for example, can only be produced in perfection in deep, light, sandy loam; and where this description of soil does not obtain, some means must be adopted to change or modify the existing staple. Lighten or deepen it as the case may require, so that the character of the soil may be modified, to suit the culture of this esteemed and valuable root. Road-scrapings, or sharp sand, will be found valuable for lightening stiff clays. Lay on a heavy coating, and afterwards well incorporate it with the existing surface for at least 18 inches or 2 feet downwards. Perform the work in autumn, and throw up the land into deep ridges, so as to fully expose it to the winter's frost. If the ground is naturally poor and unproductive, recourse must be had to manure. The best for Carrots, if it can be procured, will be well decomposed stable manure and rotten leaves. These should be well mixed together in autumn, exposed in narrow ridges to frost, and occasionally turned over during winter, in order to kill all insects and their eggs; for it is in such dry and warm materials that they take up their winter quarters. In the process of turning the manure heaps, a little salt may be occasionally sprinkled over them, which will also assist in exterminating slugs and other insects, and stimulate the crop afterwards.

These preparations having been carried into effect, and a full crop of Carrots the object in view, the ground should be again turned over during dry weather in January or February, but on no account touch it unless the soil is dried up by frosty winds. The ridges should be halved, that is, the half of two ridges turned into the furrow, and a new ridge formed, thereby exposing the centre of every ridge to the action of the atmosphere. This may appear a tedious operation, but where the production of good Carrots is a desideratum, the labour will be amply repaid.

The best time to sow for a principal crop is from the 20th of March to about the 10th of April. Much, however, will depend upon the weather. If heavy rains, or boisterous weather prevail, the work had better be delayed until the land is in proper *tilth*. The performance of an operation of this kind under adverse weather, is to propitiate a failure; for as a general rule, no operation of seed sowing should be performed unless those conditions evidently essential to success are secured. *Pharo.*

Home Correspondence.

Garden Gossip.—I too have a double-flowering Geranium, more surprising than "Willmer's Surprise," and I look upon the "matter of high gardening interest," in the acquisition of a race of double Geraniums, for bedding out, as only a question of time, and I take blame to myself for not having double Geraniums in abundance by this time, for I have repeatedly seen seedlings having from six to nine petals, but never with ten. These, however, did not come up to my ideas of bedders, and I destroyed them; for, to say the truth, I overlooked the idea of "the tendency to become double being increased." But now that you have pointedly made the suggestion, breeders will be more alive to the subject. I ought to have said, however, that I did keep one seedling with, I think, seven petals; and a very beautiful bedder it will be; it is from an only seed obtained in five years' class crossing with Diadematum rubescens—or D. superbum of the London gardens—the finest of all our bedding Geraniums. If any of your friends along the Valley of the Po were to undertake to originate a new race of double Geraniums, or an improved race of single ones, this should be the mother plant; but our climate is too moist for it to perfect seeds. It was in the hot summer of 1846 that I obtained the one seed from it which produced my favourite seedling, which I have called Diadematum regium. I tried many experiments with the mother plant, thinking that I could thus overcome its aversion to seed, and even to influence the constitution of the seedlings, if they should come; but I believe that this latter is a wrong notion, although many of us believe in it. Whether it was from the effects of these, or any of the experiments, I cannot tell, but one day last May I observed a curious formation of the stipules on one branch, something like the jagged calyx in your figure (p. 515), and by-and-bye flower-buds appeared with fringed envelopes, and at last a perfect double flower opened. Now was the time to collect all my philosophy to one point. What was to be done? Here was the wonder of the age staring me in the face, and if I let slip the opportunity of perpetuating the monstrosity, the like may not happen again for this generation. "Thinks I to myself," at last, something has caused a disarrangement in the formation of the parts; but as the season advances, and the plant gains more strength, this branch may possibly be able to regain the wonted character of its parent, and the best plan will be to cut it off from all communication with the parent, and so force it to form a community of its own likeness. The branch was accordingly cut off, cuttings made of it, and now they are all safely rooted, but whether they will show double blossoms remains to be seen. I think they will; indeed, I have no doubt on the point. I took the double blossom round the garden, but none of our gardeners could say what plant produced it. Now, it strikes me that if this Willmore Surprise originated at Oldford, near Birmingham, Mr. Cole's fingers had more to do with its doubleness than all the Hollyhocks in the country, and I wonder that he should allow such absurdity to pass through his garden gate. He is one of my pupils, whose diligence and attention to my vagaries in crossing flowers I shall always remember with gratitude. Moreover, he is the only young man I ever had to whom I could confide the issue of an experiment in that way with confidence. "It never rains but it pours." Two months after the appearance of this double Geranium, the double Calystegia pubescens from China turned single with me, and a very pretty flower it is—quite a charming hardy twiner, but I have not been able to seed it yet.—Beaumontia grandiflora: I am well pleased to learn that your worthy correspondent "A Devonian" has flowered this magnificent climber, or rather twiner, in his conservatory. Those who try to flower it in the stove are fighting against the air, and yet I have flowered it partially in the Orchid house, on the starving plan. I took the covers off a piece of old flue which passed by the side of a division wall which separates the Orchid house from an intermediate house; the length of flue is 8 feet, the depth 18 inches, and the width 14 inches. This was filled with rich compost, and the Beaumontia planted in it, and also the purple-fruited Passionflower; the latter with its roots thus cramped in the stove, and the top carried into the intermediate house, does very well, producing fruit and only half the usual growth of shoots and leaves, which render it almost troublesome under more favourable circumstances; being a free grower it receives the best part of the confined border, and leaves my favourite Beaumontia on short commons, but that has caused it to flower in the stove over the Orchids. Perhaps "A Devonian" would like to know that I once cut off a branch of the Beaumontia from the top of the conservatory with 29 flowers on one head, 17 of which were open at once; but he must be aware that these flowering branches should be cut back to a couple of joints in succession as they are done flowering. I do not know of any novelty in conservatory climbers, but there is a host of splendid Bignoniads yet to be introduced from the Brazilian forests, some of which would also do in our conservatories as well as this Beaumontia. *D. Beaton.*

Spot on Geraniums.—It is now very generally acknowledged that this disease is a fungus, generated probably by exposure to wet and cold, and curable, I believe, not by any nostrums, but by better treatment, as my experience appears to confirm. The annoyance I had suffered from this disease for several years past at length induced me to destroy my whole stock of Geraniums, excepting a few diseased plants, which I placed in a greenhouse having a span roof. In this situation several of them have remained unmoved for the last eight months, in full health, free from the "spot," and without being drawn up, although standing all the while upon the floor; while others not diseased, and standing on a stage under a lean-to glass roof facing the south, have, in six weeks only, lost much of their vigour, and become drawn up. Such appear to be the advantages of equable treatment and of span roofs. I may add that, although bees have been carefully excluded from both the houses, shading has not been resorted to in either; and that the petals of the Geraniums so treated have, nevertheless, not fallen off earlier or faster than when shading was formerly practised in the lean-to house. *C.* [Who says that it is a fungus?]

Potatoes.—Our Potatoes were planted here (the north of England) in March, which is considered late for planting them. They were well manured with the haulm of Peas, flower seeds, &c., which had been trodden down by pigs in the pig-yard, and mixed with good cow-dung. When the first Potatoes were lifted, they were very sound, and they continued in that condition until the 22d of August, when it was found that two lines, each about 20 yards in length, were attacked by disease, and we feared that the whole would soon become affected, for the tops were beginning to die down to the ground. We were, however, agreeably surprised to find, on a thorough examination, that the whole, with the above exception, were as sound as at first, and quite ripe, to which the dying off of the tops is to be attributed. They are as yet quite free from disease (being still examined every day), and we are led to think that they will now escape. The two lines referred to as having been attacked were immediately under the shade of a row of tall Poplars, which, when there is rain, throw the drip upon the Potatoes, and render the ground sour and heavy. This, I think, is sufficient to cause the speedy increase of disease. *S. F., Gateshead Nursery, Durham.*

Fuchsia spectabilis and other sorts.—Few, if any, have succeeded satisfactorily with respect to the management of this fine Fuchsia. Some of our best plant-men complain that they cannot grow it. Messrs. Veitch have never brought it to anything like perfection. Many might therefore be led to believe that it is uncultivable; but I have found the reverse to be the fact. My plant measures 6 feet 6 inches in height, 9 feet 3 inches in circumference, and has been in flower, more or less, since the middle of June. Has any one a finer specimen? This plant was received from Messrs. Veitch, last year, when it was only about 3 inches high. Some complain of Fuchsia serratifolia not flowering with them. I flower plants of that species both in a small and large state. My finest plant now stands 8 feet 3 inches high, by 9 feet 4 inches in circumference. Fuchsia corallina is a noble variety for pot culture. My finest plant of it is 12 feet high and 12 feet in circumference; 10 or 12 might be selected, not one of which would be under 10 feet in height. Fuchsia Comte de Beaulieu is another fine variety. My finest plant of it stands 6 feet high, by 8 feet 2 inches in circumference, the latter measurement being at 3 feet from the pot. The above are all in flower here at this time, and many who have visited Garnstone-park can bear testimony to the correctness of my statements. If any one has succeeded in growing and flowering these kinds of Fuchsias better, I shall feel grateful for their instructions as to the management of Fuchsias in pots. At another time I shall have much pleasure in giving my mode of growing and flowering the Fuchsia, provided no better success has been obtained by any other grower. *D. Kidd, gardener to D. P. Peploe, Esq., Garnstone-park, Hereford, Sept.* 3.

Inutility of Garden Rakes.—I am inclined to think that rakes are in a garden purely mischievous, keeping the surface of the soil in a state ill-suited to what grows in it, encouraging a false ambition of decorating that which is essentially ugly, do what you will, and leading the gardener to keep bare the spaces between the permanent flowers in the borders. I am disposed to order my gardener to use the hoe only. What is your advice on the subject? My soil is mostly very light. *O. F.* [The principal use of rakes is to render soil neat, and to prepare ground for seed.]

Luminous Insects.—Last night, about 10 o'clock, as I and my son were passing through a dark lane near this village (North-house, near Bideford), my attention was attracted by two well-defined phosphorescent spots shining clearly through a tuft of Grass by the road-side. On attempting to take up one of these (glow-worms as I supposed), I found that the luminous matter was a fluid which spread about under my fingers upon the ground, and which, on being rubbed upon my hands, covered them with light becoming for a time brighter by friction, but gradually dying away, and in less than two minutes becoming extinct. On proceeding to examine the other spot, I was somewhat startled at seeing it glide away in a serpentine course across the road like a little stream of phosphorescent quicksilver. On putting my finger upon it its progress was at once arrested, and I found it was an insect, and although too dark to see its character as such, I felt sure it was no glow-worm from its great comparative strength, and also from its persevering attempts to bite my hand. On bringing my captive to candle-light, I found it to be, as I had indeed already suspected, one of the centipede genus, of whose phosphorescent endowments I remember to have read. But what was the luminous fluid, which left neither odour, colour, nor trace of any kind upon my hands? Am I right in supposing it to be an excretion of the animal or of its mate? I enclose the insect, that you may inform me and your non-entomological readers of its species. *M.* [The luminous properties of Scolopendra (Geophilus) electrica have long been known, as indeed indicated by its specific name. The insect above alluded to, however, is distinct, being the Scolopendra (Lithobius) forcipata, which has not hitherto been observed to emit light. This light is produced by a fluid secretion from the animal, and is strongest during pairing time. *W.*]

The large Vine at Sillwood Park, Sunninghill.—This fine old Grape Vine was planted in the year 1815, and its trunk is now 21 inches in circumference. It is planted inside and near the centre of a lean-to house; it has nine horizontal branches, which extend right and left from the main stem; the area they cover is 123 feet by 14 feet. The Grapes are now colouring without the least artificial heat having been applied to them; there is not a square foot but has its bunch of Grapes. I may add that I should be most happy to show the Vine to any one who may be inclined to pay us a visit. *G. Brown, Gardener to Mrs. Forbes, Sillwood Park, Sunninghill, Berkshire.*

Potato Disease.—With respect to the Potato disease, which is very bad in this parish on the heavy soils, allow me to say that both last year and this I planted my Potatoes in drills, throwing in about 3 inches of cinder dust, and then covering the set with about 3 inches more. Last year I had not a peck of bad ones, and I yesterday took up my crop, and did not find 12 diseased ones. The crop is about 14 bushels. *A. F., Bedale.*——Potatoes planted in the beginning of April have this year proved a most excellent and abundant crop, while those planted later are blighted in the tops; notwithstanding this, however, the tubers are not diseased, the only defect is the size, according to the time they were planted, as the blight made its appearance here in the beginning of August, and, as a matter of course, as soon as the tops were blighted the tubers would then grow no larger. They are, however, excellent when cooked. *M. Saul, Garstang, Sept.* 3.

Pond Weeds.—We have a small pond in our garden which used to be supplied by pumping from a well; but in order to have better water for gold fish and some aquatics in pots, we lately, at some expence, brought a constant stream from a higher level, which keeps constantly dripping in and out; we, therefore, hoped the

green Ulva, or some such plant floating, would be banished; but instead of this it has so increased that the water is thicker and greener than when stagnant, though the tank is lined with cement throughout. What can we do to keep this green slimy plant from growing? We have, to-day, cleaned it out and put large pebbles in. Would moving them often be a preventive? *Constant Reader, Sandgate.*

Mildew.—Like the Potato disease, this, as to its cause, seems to defy all the investigations of learned and scientific men. One says it is excess of moisture in the air, or in the soil, or both; while another has just discovered the fact, that to water plentifully, with a large supply of moisture from horse-dung, is an effectual remedy. Who, then, is to decide when doctors disagree? Without, however, speculating too much on this point, I may state that I believe it is produced by a combination of causes. In the first place, there can be little doubt that a free circulation of air, with the houses kept clean and sweet, is a grand preventive, although atmospheric influences have a great deal to do with the evil. I have seen it very bad in Vines, Apricots, Gooseberries, and Potatoes, and even on Maple trees in parks, while, to the unassisted eye, it appeared to be the same sort on all, and I can compare its smell to nothing but to that of the bottom of a hay-rick after being wet through. In regard to its progress, I have found it get much worse after a few days of wet cold weather; and, in Vineries, affecting Hamburghs worse than other sorts of Grapes; even where Hamburghs and Muscats were grown under the same rafters, I have found the Hamburghs very bad, while the Muscats were, comparatively speaking, clean. The grand point, however, at issue is, what will cure it? Sulphur will, if applied in time, and persevered with; but it is neither one, two, nor three applications that will cure it if it is very bad. The house, or houses, ought to be carefully examined every morning, and if there is the least appearance of mildew, the plants affected should be immediately dusted with sulphur, and the application continued until the fungus is completely destroyed. Sulphur fails in a great many cases, because people have not patience to give it a fair trial. *J. T.*

Water Melons.—I beg to offer a few remarks on Water Melons, having grown them and seen them grow in one of the western islands for three years. I sowed the first year in beds adjoining common Melons, and treated them like the latter, but I soon found that I had made a mistake; after getting good strong shoots 5 or 6 feet long, I stopped them as I did those of other Melons, but they produced no fruit on the laterals like the kinds commonly cultivated; in fact they showed no fruit at all. This induced me to examine a field of them which was near me. I found it one mass of leaves and vine, and there was plenty of fruit, but not one on the lateral branches. After that I allowed mine to grow as they pleased, and after letting them run from 10 to 20 feet in length they produced very fine fruit, but it was late. The following year I divested some of their laterals, others I stopped, but I found I could get no fruit except from strong shoots from 10 to 20 feet in length. Last year I tried various other experiments, all of which proved that strong shoots of the above length, with abundance of leaves, were requisite in order to have good fruit. On another occasion I may give the mode of treatment I would pursue with the Water Melon in this country. *George Brown, Chelsea.*

Potato Pit.—The best method I have hitherto adopted in preserving my sound Potatoes good till spring, since the Potato disease of 1845, is by putting a single row or layer of Potatoes about 8 or 10 inches below the surface of the ground, in a dry situation, the same day as taken up, upon a layer of straw, and then covering them well but lightly with mould; I then add another layer of Potatoes, and so on, bringing the heap to a point. I afterwards dig a trench all round the heap or pit, and I place the earth therefrom evenly over the Potatoes, which preserves them from frost during the winter. I then cut a branch from the one made round the pit, which keeps it perfectly dry, and the Potatoes when taken out are equally as good and nicely flavoured as when first taken up. *W. Griffin, Daventry.*

Lapageria rosea.—It may be interesting to know that this plant may now be seen in flower in Mr. Skirving's Nursery, Walton, near Liverpool. *J. M., Walton Nursery, Sept.* 4. [It has also flowered in the garden of a gentleman living near Barnet.]

The Potato Disease first appeared in the crops about the 14th August; but, up to this time (September 3d), the tubers are sound, with a few exceptions, and we are yet in expectation of a full crop. The tops have commenced growing again on some fields. *W. Rothwell, Winwick, Lancashire.*

Shrubs, &c, that will withstand the sea breeze.—I have found the following to withstand it satisfactorily, and they may be of some little assistance to "F. A. P.": Hydrangea japonica, Fuchsia Ricartonii, Abutilon vitifolium, Leycesteria formosa, Veronica decussata, Ribes sanguinea, do. do. var. albida. These will all stand by themselves, without any wall. I venture to guess that what he calls his Fuchsia rivularis is the old Fuchsia radicans, from his description of its growing to the height of 17 feet on a wall, and I hardly know a garden in Wales in which I have not found it. I think in the climate of Pembrokeshire that the Benthamia fragifera might be found sufficiently hardy; it is at any rate well worth the trial. The Araucaria imbricata and Pinus insignis and Quercus Ilex are the best trees as evergreens to afford shelter against the sea breezes. *Cerniwaidd, Aug.* 31.——The following will grow near the sea.

Tamarix gallica	Colletia horrida
,, germanica	Eryngium maritimum
Atriplex Halimus	,, cordifolium
Salsola maritima	,, amethystinum
,, fruticosa	Arabis albida
,, herbacea	Helleborus niger
Hippophae rhamnoides	,, viridis
Crithmum maritimum	Arum maculatum
Convolvulus soldanella	Veratrum niger
Glaux maritima	Cineraria maritima
Ephedra distachya	Arbutus Unedo
Genista sagittalis	Kochia maritima
Scilla maritima	Halocnemum maritimum
Campanula Trachelium	Bupleurum fruticosum

The Fuchsia which he calls rivularis is probably virgata. *J. Rogers.*——The best shrub for planting by the sea side is Tamarisk; it has a beautiful appearance, is very hardy, and requires no support or training. A great quantity of it is grown in the neighbourhood of Brighton, Dover, Ryde, Hastings, &c. *B. W., Brixton.*

Early Shaw Potatoes ripe before the Ash-leaved Kidney.—I planted Early Shaw Potatoes, with Ash-leaved Kidneys, on a piece of ground rather of a stiffish character. The Shaws were certainly in advance of the Kidneys, to my surprise. The Kidneys yielded fairly, but they were employed a long time in making a large quantity of bine. Can any one inform me if I may attribute this failure of the Kidney to mature before the Shaw to the condition of the soil, and whether I could ensure the Kidney to beat the Shaw if I plant it in a loose, open, friable soil, on a warm headland. *A. B.*

A Slug Preserve.—Many contrivances have been invented for catching slugs and other insects in kitchen gardens, and especially among Strawberries; but none will be found to succeed better than Mr. Roberts' tiles. They seem, in fact, as if they had been made for this purpose. They form the finest breeding places for vermin that any man could have discovered. A gentleman asked a Strawberry grower the other day how he liked the tiles. "They are first-rate for catching slugs, and affording a harbour for vermin," was the reply; "but, for other purposes, they are worthless." "Well," says the gentleman, "I had some, in order to test their value, and we thought our Strawberries were not near so good upon them as formerly they were without them." "Well," said the Strawberry-grower, "put them to the purpose for which they are best adapted, *i.e.*, make slug-traps of them." *Jas. Cuthill, Camberwell.*

Societies.

Horticultural, *Sept.* 3.—E. Brande, Esq., in the chair. On this occasion several subjects of interest were produced. Mr. Henderson, of the Wellington-road Nursery, St. John's Wood, sent Vriesia splendens, with a long feather-like spike of scarlet floral leaves; Beaufortia purpurea, a small Swan River shrub bearing little round tufts of purple flowers near the ends of the branches; Eriocnema marmoratum and æneum, two Melastoma-like plants, more remarkable for their handsome variegated and velvety green foliage than for the beauty of their flowers; an attractive yellow-blossomed annual named Microsperma bartonioides; the well-known Æchmea fulgens; the white variety of Achimenes longiflora or Jaureguia; plants of Tigridia canariensis, whose flowers had unfortunately closed before the time of exhibition; the bright salmon-coloured, Geranium, called "Beauty of the Parterre;" brilliant cut flowers of two kinds of hybrid Gladiolus; a blue-flowered Convolvulus from St. Catherine; Messrs. Veitch's variety of Gesnera picta; and an unripe example of the Serpent Cucumber (Trichosanthes colubrina), a fruit which possesses poisonous qualities, but is very ornamental when ripe, on account of its bright red colour. A Banksian Medal was awarded for the five first mentioned plants.—Four kinds of Achimenes, consisting of longiflora, venusta, Skinneri, and grandiflora, were exhibited by Mr. Dobson, gr. to J. Foster, Esq., of Westbourne-grove, Bayswater. Some forced Late Admirable Peaches, remarkably large and fine, and some ripe Mangoes, were furnished by Mr. Scott, gr. to Sir George Staunton, Bart., Leigh-park, Havant, Hants. One or two of the Mangoes were somewhat injured by travelling; but the others arrived unblemished. It was stated that the tree which produced the fruit in question seldom or ever failed to ripen a good crop of excellent Mangoes every year. A Knightian Medal was awarded for these exhibitions.—A curiosity in the shape of a Pine-apple was exhibited by Mr. Steers, market gardener, Teddington. It was an example of one of those Pine-apples, or rather masses of Pine-apple (for one mass will often fill a peck measure), which are to be found in the markets of Batavia, and in which the pips possess the peculiar property of elongating and producing second fruits. In the specimen shown only two of the pips near the base had pushed, and were forming lateral fruit; but these furnished sufficient evidence that the peculiarity would be retained under cultivation in this country. Nothing can be stated as to its quality, for the fruit was not cut up.—Mr. Middlemiss, gr. to A. Pott, Esq., of Bentham-hill, Tonbridge Wells, sent two large coarse-looking Melons, affected with the disease mentioned at p. 516. It has been suggested that injudicious watering may have had something to do with the production of the evil; but Mr. Middlemiss stated that in his case, at least, this could not have been, for his Melons had never been watered. A plant, with six fruit on it, was reported to have four out of the six diseased.—From the Society's Garden came a very fragrant Orchid-like Epidendrum alatum; the Ginger-wort called Roscoea purpurea, Cuphea purpurea, pretty, but hardly sufficiently showy to make a good bedding plant; three Cape Heaths, Beaufortia splendens, the scarlet flowered Aphelandra cristata, three varieties of Achimenes, the gracefully drooping Bæckia patula, Boronia denticulata, the pale yellow Calceolaria cuneiformis, Franciscea Hopeana, and the following Grapes: Black Prince, Chasselas Musqué, and Olwer. The latter is described in the Journal of the Society, vol. iii., p. 307. It is a Rhenish wine Grape, something like the Sweetwater in appearance, and is stated to possess peculiar properties. The Chasselas Musqué is well known to be one of the finest Muscat-flavoured Grapes in cultivation, but it has got the bad character of being liable to crack. It has been ascertained, however, that the cause of cracking is too much moisture in the border, &c., at a certain stage of its growth, and that therefore the evil is entirely under the gardener's control. In the present dry season, not one cracked berry has been observed in the plant which has fruited in the Society's garden. The same establishment also furnished a small green Savoy (Chou de Milan très hâtif d'Ulm), which will be found to be valuable, on account of its being fit for use before the other sorts, and in being tender and good; but it is too small for market gardeners; likewise a red Capsicum, called the Tomato Capsicum, on account of its resemblance to that fruit. With those who are fond of mild Capsicums this will be a favourite. It is stated to be very productive.

Entomological, *Sept.* 2.—J. F. Stephens, Esq., V.P., in the chair. Donations to the library were announced from the Royal Society of London, the Imperial Society of Moscow, the Entomological Society of Stettin, &c., including a biographical memoir on the late Dr. Erichson by Dr. Klug, and an elaborate paper on the blind Annulosa of the Styrian caves, by M. Schiodte. Specimens of the rare Epunda lichenea, from the neighbourhood of Liverpool, were exhibited by Mr. Gregson; also specimens of the very beautiful Rhodaria sanguinalis and a new Elachista, by Mr. Shepherd, from New Brighton. Mr. S. Stevens exhibited specimens of an apparently distinct species of Amphimalla taken at Tenby by Captain Parry; also specimens of both sexes of a fine variety of Papilio (ornithoptera) Priamus, from Richmond river, on the east side of New Holland. Also specimens of Celoma ænea, Pytho depressus, and Rhagium indagator, sent from Perthshire by Mr. Weaver. Mr. Douglas exhibited a very interesting series of minute Lepidoptera from Folkstone, Mickleham, West Wickham, &c.; many of them bred from the larvæ, including several new species of Gelechia.—Mr. Westwood stated that he had recently received a number of specimens of Limexylon navale in the perfect state from Pembroke dockyard, where they had appeared by thousands, the larvæ infesting Oak timber, which had been in dock four years, and had been found uninjured when first received there. He also stated that he had received specimens of Apate capucina from the same dockyard, where it infested the Isturian Oak; and Mr. S. S. Saunders stated that, in the south of Europe, he had only found it inhabiting the trunks of Quercus Ilex. Mr. Westwood also stated that he had reared two species of Astyages (A. nigricella and Hemerobiella) from the case-bearing larvæ which had attacked the Pear trees in the Garden of the Horticultural Society at Chiswick during the past summer.—Mr. White gave an account of the perforation of a leaden water-pipe attached to a piece of American timber by the long-horned beetle Monohammus sutor, which had been reared within the wood. He also alluded to the lead-boring habits of Callidium bajulum, another beetle of the same tribe. He likewise exhibited a box of interesting Indian insects collected by Mrs. Captain Hamilton, including the butterfly, Idæa gaura of Horsfield, together with a drawing of its caterpillar, proving it to belong to the genus Euplæa. This exhibition led to an extended discussion as to the advantages resulting from an investigation of the preparatory stages of Lepidopterous insects, as well as to the relative value of the characters derived from the larva or perfect state of this order of insects. *W.*

Royal Horticultural Improvement of Ireland.—This Society held its last exhibition for the season at the Rotunda, on the 27th ult. It was the dullest period of the season for greenhouse and stove plants, and most of the florists' flowers were also past; competition did not, therefore, run high among either of these classes. Cape Heaths appeared to attract most attention, some of which were, indeed, beautiful examples of their kinds. We have on several occasions seen larger specimens, but rarely have these beautiful plants appeared in better condition, or handsomer, than at the late exhibition. The plant which obtained the first prize, for the best single stove exotic, was a beautiful specimen of Pleroma elegans, which was covered with large bright Tyrian purple flowers. The elegant habit of this plant, with its prettily-shaped dark green leaves and showy blossoms, renders it one of the most desirable subjects for a greenhouse, or cold stove, which has been introduced to our collections for some time. Among Orchids, the curious Peristeria elata was conspicuous; as was also a nice specimen of Stanhopea Wardii, which was suspended from the chandelier in the centre of the room. The varieties of Fuchsia exhibited were very good, and in considerable abundance, and they deservedly attracted much attention. There were several good samples of fruit and vegetables staged, but in no such quantity as might have been ex-

pected at an autumn exhibition. *From the Dublin Advocate of August* 28.

Review.

The Commercial Handbook of Chemical Analysis. By A. Normandy. Geo. Knight, fcap. 8vo, pp. 640.

The person who would undertake, in an age like the present, in which the rapid progress of science, art, and luxury is only equalled by the ingenuity and fraud with which almost every object of commerce is adulterated, "to indicate the falsifications or impurities which, naturally, accidentally, or intentionally, may contaminate the various articles met with in commerce, and to enable the public to detect the nature and amount of these sophistications and impurities," would enter upon a task requiring for its fulfilment an amount of general knowledge rarely to be met with in any one individual, and, we fear, not in the author of the work before us. We are ready to make reasonable allowance for mistakes, which must have been committed by any one, however well acquainted with his subject, in carrying out so difficult a task; but we were not prepared to find so much room for serious criticism as exists in the present volume.

It is evident that the author has a very limited acquaintance with natural history, and most especially with minute anatomy, upon which, above all other things, reliance may be placed most safely in the examination of all raw vegetable products. The mode of detecting fraud is in fact treated of much more in the manner of a chemist than of a naturalist, and far too incompletely even in the former point of view. For instance, while the author has taken the trouble to mention such substances as bromine, succinic acid, and others of interest only to the professed chemist, who would hardly be compelled to seek for information in a work of this sort, no mention is made of such common articles as Senna, of which hardly an unadulterated sample can be procured, or of the still commoner substance, we had almost said article of food, Tobacco, in the preparation of which, perhaps more adulteration is practised than in any other substance that can be named. Senna and Tobacco, which we have only taken by way of example, are not such rare and out-of-the-way things as to demand no attention or be excusably omitted.

Errors, too, are neither few nor far between. It is stated that sugar is extracted from *Arundo saccharifera*; and that "Chocolate is a preparation of the Cocoa-nut, obtained by grinding the nut roasted and shelled," &c. This is new. For our own parts, we always thought that Cocoa or Cacao was the seed of a plant called Theobroma Cacao, the resemblance between which and Cocoa-nut no ingenious naturalist has yet discovered. That this mistake is not a misprint seems to be shown by the context. Again, "*La veno beno* has been represented as being the leaf of a tree, and that tree a climbing plant, well known in the East under the name of Paun, which is clearly a much less pretty, and, consequently, a much less saleable name than *veno beno*. But by whatever name called, *La veno beno* is neither plant nor leaf, but simply a mixture of a very small portion of tea powder (broken tea leaves), with an excessively large quantity (upwards of 90 per cent.) of pulverised catechu." It is possible that various sorts of this trash may be sold in the shops; such samples as we have seen were a mixture of Catechu with various leaves, among which, Rhus coriaria, a powerful astringent, used by tanners, and perhaps Rhubarb, were ingredients. Chicory, we are told, cannot modify the stimulating action of coffee, except by dilution. "Chicory," it is added, "has no other virtue than that of imparting a brown colour to the water in which it is boiled or infused." Does the author mean to say that its tonic, aperient and sedative qualities disappear upon its being roasted? And how does he explain the undoubted fact, that those who cannot drink coffee pure, because of the wakefulness it produces, sustain no such inconvenience from the use of the mixture of chicory and coffee?

As a specimen of useless direction, the following example may be taken. We find it stated that "the purity of fixed oils may be approximatively determined, and the admixture of cheaper oils detected by observing the peculiar odours of the oil when gently heated. For this purpose, a few drops of the oil under examination should be poured in a small porcelain or platinum capsule, and exposed to the heat of a spirit lamp. The odour which is evolved immediately suggests that of the plant or animal from which it has been obtained, and this characteristic is valuable, more especially if observed in conjunction with the genuine oil, and furnishes accurate indications of the presence of Linseed oil, whale oil, train oil, or Rape oil in any mixture. M. Perrot, however, observes that the odour of the oil is not always a safe criterion, since an oil of the same fruit or nut has not always the same odour. This is especially the case with Olive oil, the odour of which differs according to the different places where it has been grown. The same is the case with other oils, if drawn cold, or if expressed under the influence of heat." Now let any one, knowing nothing but what he is told here, try to apply this test; the first part of it comes to this—"heat the oil, notice the odour, if the odour is not that of genuine oil the sample is adulterated;" but an inexperienced person might ask, how am I to know what the smell of genuine oil is? and without this how can I accuse the seller of the oil of having sold me an adulterated article? Supposing, however, this difficulty to be overcome, it is clear that the second part of the above passage practically annuls the first; how is anybody to know whether a given oil has been "drawn cold or expressed under the influence of heat?" If he knows that such is the case, the test is clearly inapplicable; if he does not know that such is not the case, the test is no less practically valueless.

The directions concerning arrowroot are little better; the microscope can indeed enable an observer to distinguish it from its falsifications; but certainly not by such peculiarities as are given by Dr. Normanby. A person who should find himself relying, in a witness box, upon such vague differences as are here given, would speedily discover their unsatisfactory nature. In like manner the method indicated of determining the falsification of tea by other leaves are wholly insufficient for the purpose; and all we are told about so important an article as guano is that the purchaser "should choose it as dry as possible;" on the other hand the reader is furnished with 12 pages of chemical matter relating to the mere qualities of pure guano.

Faults of this kind seriously detract from the utility of the present volume, which, nevertheless, contains a great deal of useful information, and may be made the basis of a work really worth consultation.

Miscellaneous.

Potato Disease in Canada.—We regret to hear that in many places in the neighbourhood of the city the Potato blight has again appeared. We have seen evidence of it in the vicinity of the River St. Charles, and a farmer from there informed us to-day that he had inquired of several farmers from Jacques Cartier and Valcartier, who state that the blight has also there appeared. *Quebec Mercury.*

Live Fences for Enclosures.—It is no easy matter, though very desirable, to be able to enclose land quickly and effectually. Some persons for this purpose use single stems, 4 or 5 feet high, placed crosswise, inclining from right to left and from left to right alternately; this plan is however not a good one as the plants grow irregularly, and the branches sometimes die and leave spaces very difficult to fill up: in order that this plan may succeed, the shoots should be interlaced as the plantation proceeds. Another plan is to make a double hedge; this, however, is objectionable. It often happens that the two lines of plants, though very close, will not grow the one amongst the other, but leave a space between them which destroys the solidity of the whole. Besides, no air circulating in this hollow, the young branches die and leave a sort of passage between the two hedges. To avoid these inconveniences I have adopted the following plan, and with great success. A trench a yard wide, and a little more than half a yard deep, is dug round the place to be enclosed. The earth removed by digging to the depth of one spade is put on the right bank, together with the turf from the surface previously placed there; the earth removed after this is thrown on the other bank: into the bottom of this trench is then thrown all the earth thrown up by the first, and some of that thrown up by the second digging, and the level of the plantation is obtained by means of the turf before mentioned. In the middle of this trench a cord is then stretched and kept in its place by stakes driven into the ground every 10 yards. The planting is then begun. The plants about three years old, and not quite 1½ foot high, are placed on the turf which is introduced among the roots. The latter are then covered with earth, on the top of which is lightly placed some well-worked dung, and the whole is then filled in with the earth remaining on the left bank. The plantation is in the course of the first year dug as much as necessary, and in the autumn rather deeply, not however so as to disturb the layer of dung already spoken of. The second year the same operations are performed, and the plants may be pruned. In the third year, and not before, the plants are cut down to the height of 3 feet. In the fourth year the hedge is formed, and may be pruned first in June and again in September. By this time the hedge will be a much better protection than those planted in the common way are at the end of 8 or 10 years. It must not be supposed that the above method of procedure is costly. My hedge kept in good order costs no more than an ordinary one badly kept up. The earth being well arranged works easily; and the pruning being performed twice a year, takes very little time, as there is no hard wood to cut. *Revue Horticole.*

Vibrio Graminis.—On the 28th of May I noticed that the leaves of the sheep's Fescue Grass (Festuca ovina), and if I recollect aright, of some other Grasses, growing close upon the sea coast, were affected with several purplish swellings, of which I brought away examples for examination. They only appear a little thicker than the leaf in whose substance they originate, and according to their length are squarish or oblong, slightly roughish, stiff and rounded like a piece of wire, and occupy either the entire breadth or are confined to the edges. At first, from finding in the interior only bluish or purplish granules, I felt disposed to attribute them to a fungus; till opening others more carefully, I observed several minute Annelides, coiled up in channels winding amongst the granules. These I subsequently found were Vibriones, of which one species, Vibrio Tritici, as is now well understood, produces the disease called "Ear Cockles," or "Burnt Corn" in Wheat. Others of somewhat similar character swarm in decaying Potatoes and Turnips, and the "eel" of vinegar is an example familiar to microscopic amateurs. Some of the knots contained only a single occupant, but one of the more elongated ones had about half a dozen of various sizes. The worms are white, almost transparent, very minute and slender, just visible to the eye, pointed at each end, the posterior tapered for a very considerable space, contracting as it were by three separate gradations till it terminates in a point; the head end is something like that of an eel, bluntish, and gradually widening out for a considerable way backwards, where there is a greenish annulus, formed perhaps by the commencement of the intestines, as behind this there is a cloudiness all along the middle. I could not perceive the oral opening, but behind the point there is a dusky spot connected by a line with the interior. The young ones are immaculate white, but the old contain a profusion of greenish granules, which may be either the eggs or the undigested food. Although not indicated externally, the body is evidently composed of a series of rings which separate the internal contents; as one in which the skin happened to be ruptured was emptied in a manner corresponding to this structure. The movement of the particles at the wound was a rapid rush, which extended itself by degrees upwards; but there were intervals where the current seemed to be impeded, as if by constrictions, upon passing which it again flowed freely. The worms placed in a moisture agitate themselves to and fro, but are usually rather inactive. The length is about 1 line. The species is probably new, and may be called Vibrio Graminis. According to the observations of Mr. Bauer, Vibrio Tritici is originally introduced, in the young or egg state, into the germinating seed-corn, and after a succession of generations during the passage, is conducted by the propulsion of the circulating fluid up higher and higher, till it reaches the ear. Whether this be the means by which the present species gains access to the position which it occupies, I cannot determine. It is by no means uncommon; and as the parts affected by its presence dwarf the blade, interfere with the healthy flow of the sap, and will probably soon decay, it may be regarded as somewhat prejudicial to the coast pastures, which are principally composed of the Grasses that it attacks. The granules with which the knots are filled give out a brown tincture when moistened. *J. Hardy, in the Annals and Magazine of Natural History.*

Sale of Plants.—A collection of Orchids, and a few Pitcher plants were sold by Mr. Stevens yesterday, at the following prices: Nepenthes sanguinea, 8*l.* 10*s.*; N. phyllamphora, 2*l.* 12*s.* 6*d.*; N. Rafflesiana, 1*l.* 14*s.*; N. lævis, 1*l.* 2*s.*; N. ampullacea, 1*l.* 2*s.*; Calanthe Masuca, 4*l.* 5*s.*; C. vestita, 2*l.* 10*s.*; Lælia superbiens, 2*l.* 7*s.* 6*d.*; Dendrobium Dalhousieanum, 1*l.* 1*s.*; D. Farmeri, 1*l.* 4*s.*; D. nobile, 1*l.* 1*s.*; D. Gibsoni, 1*l.* 1*s.*; Sobralia violacea, 1*l.* 4*s.*; Cattleya Mossiæ, 1*l.* 7*s.*; Aerides odoratum, 1*l.* Other lots, of which there were in all 125, fetched from 10*s.* to 1*l.*

Calendar of Operations.

(For the ensuing week.)

PLANT DEPARTMENT.

Many of the plants intended for winter flowering will have filled their present pots, and are still growing fast; but unless in the case of very small plants, it will be better not to pot them again this season, but to assist them with occasional waterings of liquid manure. The size of the flowering pot must in all cases be regulated by the purpose for which the plants are grown, as in most cases a supply of flowering plants is required for conservatory and drawing-room decoration; and as many of them will be required to fit various ornamental vases, it is necessary to practise the small shift system, making the soil as rich as the plants will bear it; and by such means keeping the pots as small as possible in proportion to the size of the plants; if any further stimulant be required, it must be applied in the shape of liquid manure. These remarks of course apply to quick-growing plants, which are cultivated for a particular purpose, and are afterwards of no particular moment; but those plants which are intended to form fine specimens of superior and skilful cultivation should never be cramped at the roots, except for the purpose of producing a more abundant supply of blossoms upon those which are shy in that respect if grown luxuriantly. Plants may be potted with safety and advantage at any season of the year, when the roots have made such progress into the soil of the last shift as to render the operation necessary, provided always that they are in an active state, and that such activity is not the result of unnatural excitement.

FORCING DEPARTMENT.

Peach-houses.—The trees in the early houses having matured their growth, the foliage is gradually falling off, notwithstanding the care that was taken to preserve it as long as possible. To prevent the littery appearance produced by the falling leaves, a birch-broom should be passed gently up the branches every second or third day, to bring down all the leaves which are ready, that they may be removed instead of being allowed to keep the house in an untidy state. As soon as the leaves are all off, the trees should be untrained, and the shoots washed over with a solution of sulphur and soft soap; taking care to perform both this operation and that of removing the leaves without injuring the young fruit or wood-buds for next year. The glass should be well washed, and the whole of the wood-work of the sashes and rafters either washed very clean or painted; the latter is of course preferable if circumstances permit. The front trellis and the back wall should be painted with oil paint. All this may be done by the ordinary labourers, and is therefore not so expensive as at first might be thought, while it gives the house a respectable

appearance, and effectually smothers every insect, in any stage, which may be lurking about the trees or their supports. As much of the effete soil as the roots will allow should be scraped away from the surface of the border, and replaced with fresh mellow loam, mixed with fine charred refuse, which all plants are fond off. No animal manure should be applied, as the trees can be stimulated to any required extent by using it in a liquid state during the growing season. The concluding operation will be to give the borders a good soaking of clean water, which will keep them sufficiently moist during the dormant season.

FLOWER GARDEN AND SHRUBBERIES.

About a month since we recommended all those who are anxious to make the finest display of flowers next summer, to take notes of the most effective plants for the purpose, and of the habits and peculiarities of each. We would recommend that such a review be carefully repeated, and the present state of the plants noted also, marking particularly those which at that time made a creditable display, but which are now become shabby or indifferent. The object of going over them several times is to distinguish those kinds which commence early in the season, and continue in the greatest perfection to the latest period; that in future arrangements these may be generally if not exclusively used, to the rejection of all those whose beauty is short-lived. In making arrangements of this kind, it is not necessary to include an immense variety; as the symmetrical relationship between the parts not only admits of repetition, but demands that the corresponding parts should be similarly furnished. The object should be to make the *tout ensemble* perfect; and in almost every case this may be done best by a small selection. For example, if a gardener has of each distinct colour, and of the most useful intermediate shades, a few suitable plants of different heights, he may with proper taste make the arrangement of his masses as perfectly beautiful as a thing of the kind can be. The best way to proceed then is to make a list of desiderata, filling it up for the present with the things which approach most nearly to his standard, and substituting other and better things as soon as they come under his notice. One very important point to be attended to in the selection of plants for bedding purposes is the proper balance between flower and foliage, and especially amongst the bright warm colours; a mass of inflorescence is all very well in the distance, when the proper complementary colours also come within the angle of vision from the same point; but those flowerbeds which are intended to please upon close inspection, must be plentifully interspersed with green foliage to relieve the eye from the unpleasant sensation produced by gazing on an intense colour. We would wish to see the principle of methodical arrangement carried far beyond the parterre, that every clump of shrubs may give evidence of the reign of good taste, in the disposition of shades and colours. Many of the finest and most showy herbaceous plants are now in their beauty, and by studying the effect they produce in different situations, it is more easy to decide where they may be introduced with the greatest advantage. The dark masses of Rhododendrons and other evergreen shrubs stand particularly in need, during the summer and autumn months, of some flowering plants, such as Phloxes, Aconitums, Chinese and Noisette Roses, Hollyhocks, &c., planted amongst them, and the latter cannot be placed in a more favourable situation for displaying their charms, than with the deep glossy green of the Rhododendron for a ground colour.

FLORISTS' FLOWERS.

DAHLIAS will yet require abundance of water, should the weather prove dry, and fine blooms may be expected. TULIPS.—A bed or beds should be made for the offsets, and seedlings should be got in as soon as possible; every precaution should be taken, as far as preparation of the compost goes, to insure their healthy growth. The most beautiful blooms are often from maiden bulbs, or the first flowers which the offset produces. Here, too, is the amateur's reserve, from which he drafts, to reinforce his main bed. Let this advice be attended to without delay, as it sometimes happens that weak offsets of very valuable sorts shrivel and perish by being kept out of the ground too long. Pot off rooted Carnations and Picotees, and place on ashes in a shaded and sheltered place. The best florists make an erection, covering with their frame-lights, so as to prevent excessive rain from soddening the soil; regular attention as to watering, &c., must be given.

HARDY FRUIT GARDEN.

Let the young plantations of Strawberries be well attended to by stirring the soil between the plants, and supplying them with plenty of liquid manure, that they may continue to progress at root, and fully employ their leaves in the elaboration of sap. Promote by any and every means their vigorous growth now, and fine fruit next year will be the reward. Alpine Strawberries should be looked to, to see that they are sufficiently moist, as they will soon be found useful in supplying a desirable addition to the dessert. If they are in a state to receive water, supply it in the shape of liquid manure. Plant a few beds of young runners on a north wall for another year; soil a sandy loam, moderately enriched. Look to the buds of fruit trees inserted in July and the early part of August, and loosen the ties. Proceed with forking dung in amongst fruit bushes and Strawberries, and thereby encourage the production of roots near the surface of the ground; these will materially assist in perfecting the growth of the plant, and preparing it for the healthy and abundant development of fruit. Attend to the gathering of fruit as it ripens, and if any of the trees are without names, take advantage of the opportunity of ascertaining their true name, and marking the fruit as well as the plants.

KITCHEN GARDEN.

Preparations should now be made for planting out the young Cauliflowers raised last month. A shallow trench should be formed sufficiently wide to receive the handlights; the soil should be removed to the depth of about 6 inches, and laying it on the edges in a manner similar to a Celery trench. The bottom should then be manured and dug, and spaces, the size of the handlights, marked out; of these, only the alternate ones should be planted, reserving the intermediate spaces to set the tops of the handlights upon, when not required over the plants. The strongest of the young Cauliflowers should then be planted about 4 inches apart; as soon as they are planted, the handlights should be placed over them, having first been put into proper repair. The tops however should never be left on, except in frost, or heavy rains, and even in the latter case, air should be admitted. Early Celery should be earthed up as required; but the main crop must still be deferred till it has arrived at its full growth, as there is yet time. If this method be followed, there will always be less loss by rolling in the latest earthed Celery or Cardoon crops, than in that which has been done early. It is scarcely necessary to say that fine weather should be chosen for this operation, and that the soil should be as dry as it can be reasonably expected at this season.

State of the Weather near London, for the week ending Sept. 5, 1850, as observed at the Horticultural Garden, Chiswick.

Notices to Correspondents.

ANBURY: *O P* will be obliged by an explanation of the meaning of this word, applied to the well known disease in Cabbages and in horses. We suppose that he is dissatisfied with the usual derivation of the word from the Anglo-Saxon *ambre* a wart or tumour.

APPLES: *W J N.* Your seedling Apple is middle-sized, handsome, and beautifully coloured; but in point of flavour scarcely first-rate.‖

BEES: *Anna.* If you wish to take the honey this season from your common straw hive, then the best mode is to destroy them by sulphur. But would it not be more congenial to your feelings to deprive yourself of the honey this year, and keep the present stock for swarms in future years, taking care to place the swarms in the improved straw hives? these hives are most easy of management, and allow you to take about a third of their produce of honey annually without destroying a bee, and which honey is very superior to that from a suffocated hive. *Y.—J W.* Remove the piece of comb, and stop with a bung and piece of linen. There is no occasion to fumigate the bees in order to weigh them; refer to page 592 of present volume. *Y.—Birkhurst.* As you cannot succeed with your bees in straw hives, there is much less chance of success in wooden ones. *Y.*

BLIGHT: *Lady J W.* It appears very extraordinary that your trees should be in the state described; but before forming an opinion we should like to hear the gardener's explanation, with which your ladyship will perhaps favour us.

BOOKS: *A small Nurseryman* will find his new trade unprofitable, if he does not understand it without the help of books. The best to consult is Loudon's "Encyclopædia of Gardening."—*J Kearney.* Read Dr. Lindley's "Vegetable Kingdom." People must be mad who say that plants are composed of insects.

BUDDING ROSES: *Petit Pierre.* Worsted is preferable to bast for tying the buds with. There is no difficulty in budding the Persian Yellow or Harrisonii. It should be effected when the wood is ripe. The same remark applies to Perpetuals. Perhaps the Hybrid China is the easiest class of Roses to bud. For six climbing Roses, for a south wall, in a northern county, choose the following—Hybrid China: Chênedollé, vermilion; Paul Perras, rose; Madame Plantier, white. Noisette: Luxembourg, purplish red; Solfaterre, yellow; Triomphe de la Duchere, rosy blush. ‡—*F A P.* Your question is answered last week, at p. 552.

CHERRIES: *Jane.* The Kentish Cherry is round, juicy—the juice pale, acid. Stalk generally short, and so firmly attached to the stone that the latter may be pulled out of the fruit by it. It is easily distinguished from the Morello; this has a long slender stalk; fruit heart-shaped, with purple juice, acid and astringent.‖

CLUB IN CABBAGES: *W F.* It is caused by an insect. Perhaps the best remedy is putting wood ashes in the holes along with the plants at planting time. ‡

CREEPERS: *Monday.* We would suggest Periwinkles, the large-flowered Tutsan, Helianthemums, Cotoneaster microphylla, Juniperus prostrata, and such rock plants as Alyssum saxatile, Omphalodes verna, Aubrietia deltoidea, and Nonnea lutea.

FIGS: *Gateshead.* You cannot do better than follow the excellent instructions on their culture given by Mr. Markham, of Hewell, in our volume for 1844, p. 228. Few gardeners grow Figs better than Mr. Markham.‡

GRAPES: *W H.* Josling's St. Alban's is a white Grape like the Chasselas Musqué. ‡

HEATING: *C B.* You will probably find a good answer to your inquiry in some of the following pages, viz., 38, 51, 102, and 573, of our volume for 1847, and 53 and 101, vol. for 1848.

HORTICULTURAL SHOWS: *S N.* At a country horticultural show a prize is offered for "the best grown specimen of any plant in flower." A splendid specimen is sent of L. lancifolium rubrum, with nine stems, all growing from one bulb (in the first instance), which has not been divided. *Quere.* Is this specimen disqualified by there being more than one bulb in the pot? [Certainly not.]—*S E.* We doubt whether Amaryllis vittata ought to be shown in a collection of greenhouse plants. ‡

INSECTS: *H O M., jun.* The caterpillar of the elephant hawk-moth (Sphinx elpenor). *W.—Beta.* The rat-tailed larvæ of the bee-like dipterous insect, Helophilus pendulus, found in drains, privies, &c. *W.—Adoxa.* The little flies found in myriads on the blades of Grass are the Sepeis cynipsea. We cannot account for their appearing in such profusion on the small piece of ground in question. They are harmless. *W.—T C.* The Curculio is the Cionus scrophulariæ. The larva on the Scutellaria is not that of a moth, but of some species of saw-fly. Pray try to rear them or send us specimens. Our largest Tipula is named T. gigantea. *W.—M J B.* It is evident from your letter that the Cecidomyiæ larvæ were not the cause of the diseased state of the pea-pods. The species are very difficult to rear. *W.—Y O.* We do not think these Lachni are ever destructive to full grown trees, but it would be easy to destroy those on small trees by fumigation with tobacco smoke beneath a good-sized para-petticoat. *W. —T L.* We shall be glad for any further information respecting the Sirex juvencus, and are glad to have your approval of our labours. *W.—W S H.* Your Vine leaves are infested by the common thrips. Fumigation and syringing repeatedly are the only effectual means of getting rid of it. *W.—Moschatellina.* The goat moth will attack healthy trees. You may preserve the caterpillars in spirits of wine, or by making an orifice at the end of the body, pressing out the entrails, and then blowing air into the skin till dry. The large ones which formed their cocoons will appear in the perfect state next June or July, when the trunks of the trees should be carefully searched and the moths destroyed. *W.—F A P.* The caterpillars which have so much alarmed the old woman are those of the Death's-head moth. *W.—G M.* The insect found on the bunch of Grapes is the caterpillar of a small moth, Cochylis omphaciella. It is of rare occurrence in this country, although well known in France, but an instance was recorded in our columns last year. *W.*

IRISH PEAT CHARCOAL: *J R.* The Irish Amelioration Society, in Waterloo-place, London, profess to sell it.

NAMES OF PLANTS: *A Lady.* 1 and 11, Lastrea Filix-mas; 2, Ceterach officinarum; 3, Asplenium Trichomanes; 4, A. Ruta-muraria; 5, A. lanceolatum; 6, no specimen; 7, A. Adiantum-nigrum; 8, Lomaria borealis; 9 and 14, Polypodium vulgare; 10, Pteris aquilina; 12, A. Filix-fœmina; 13, Lomaria borealis; 15, Scolopendrium vulgare; 16, A. Trichomanes; 20, Mercurialis perennis; 24, Erythræa centaurium. *S.—Erzeroum.* 784, Centaurea Jacea? 571, C. pulcherrima, a beautiful rarity; 140, 608, varieties of C. caucasica; 243, C. depressa; 520, C. squarrosa; 509, C. cardiformis; 526, C. calcitrapoides.—*L L.* Phlox Drummondi, and some variety of Delphinium grandiflorum.—*W.* Double Achillea Ptarmica or Sneezewort.—*Cymro.* We do not know whether Bullberry and Buffalo-berry are the same; Galega officinalis.—*Usk.* Verbena officinalis, common Vervain, and Ononis arvensis.—*Peripatetic.* It is not a fungus but an Algal called Nostoc commune. Sun, air, and dryness will destroy it; dampness and shade and want of air favour it. Do not use corrosive sublimate.—*O P.* 1, Bæckea Camphorosmæ, thus named because it looks like Camphorosma monspeliaca; 2, Saxifraga flagelliformis.—*J G, Clonmel.* No. 1 appears to be Cuphea miniata; No. 2 not.—*Adelaide.* Would you favour us with the native country of your plant? It is smashed to pieces, and will be difficult to determine.

PAINT: *H S* will be obliged by any of our correspondents mentioning their experience of Carson's anti-corrosive paint for the exterior of houses; the objects being the maintenance of its colour and keeping the interior free of damp; or if any other economical paint can be recommended which will bring about the above results, with the address where it is to be obtained, or the means of making the paint and the method of its application.

PEACHES: *R W Fairbairn.* Your seedling is excellent; but we fear its total want of colour will prevent its becoming a general favourite.

PROTECTED TRELLIS: *τ.* You may now remove the sashes; by exposure to the direct rays of the sun and open air, the shoots, which you say have grown well, will become more firm than would be the case if they were kept continually under cover.‖

RINGING: *A Subscriber.* The reason why ringing brings on fruitfulness is fully explained in the "Theory of Horticulture," and elsewhere. It may be briefly described as depending upon the elaborated sap, out of which flowers are formed, not being able to descend by the bark below the ring, and being, in consequence, compelled to accumulate in the branch above the ring.

ROSES: *W W W.* They can be safely moved during the next three weeks.‡

STOVE AND GREENHOUSE PLANTS: *G G.* Consult the reports of the different metropolitan exhibitions given in our columns during the past summer; they will furnish you with the best information on the subject about which you inquire.‡

STRAWBERRY TILES. We have received three eulogiums of Mr. Roberts's contrivance, one from a neighbour of his at Brixton, and two from ladies, who sign their names differently, and post their letters in different places; but who use language to the same effect, and write upon the same paper, stamped with the same device!!!

THOM'S SEEDLING STRAWBERRY. We cannot accept any authority except our own as to the merit of what are called new fruits, nor can we assist in circulating anonymous newspaper paragraphs on such a subject. With all possible care mistakes may be made; without extreme vigilance there would be nothing but mistakes.

WIREWORMS: *Sub.* Trap them in the manner mentioned at page 261. Are you sure that it is the wireworm which is injuring the roots of your Hollyhocks? ‡

MISC.: *Roderick.* There is no fruit called the Greengage which is not the Greengage Plum. We do not know of any good practical book on English and French measures. You will find the information in Encyclopædias, and we think also in Gutch's Pocket-book.—*A Subscriber.* "Malmesbury" forgot to send his address.—*B.* Your Brugmansia swarms with red spider. Prune it hard in and wash it well with a solution of sulphur and soft soap. ‡

SEEDLING FLOWERS.

FUCHSIA: *H T.* Tube and sepals a good clear white; corolla rosy pink, and perhaps rather small; substance good; a desirable variety.*

HOLLYHOCKS: *Y.* 2, 5, 6, 11, 13, 26, 44, 68, 91, 154, 197, 200, bright crimson; 3, 4, 22, 36, purplish crimson; 15, 16, 31, 115, 199, medium-sized rose; 79, pink varied with white; 50, 63, 89, buff and salmon; 7, 8, 155, good white; 46, 78, sulphur coloured, the latter the best of the two; 130, chocolate; 87, nearly black, but very thin. The above are all worth trying again, more especially the bright crimson kinds; but all of your flowers in their present state are too small to compete with the fine kinds now in cultivation. The other numbers appear to be worthless.‡

PETUNIAS: *G B.* Withered up and quite unexaminable.*

IMPORTANT NOTICE.—EMIGRANTS are informed MARY WEDLAKE and CO. have from time to time supplied the first settlers to Swan River, Port Natal, and all the Australian Colonies, with AGRICULTURAL IMPLEMENTS; they beg an inspection of their stock, at 118, Fenchurch-street, near the Blackwall Railway. N.B. Persons becoming purchasers may have the benefit of an introduction to parties known to the firm at either of the above-named places.

MESSRS. NESBIT'S CHEMICAL AND AGRICULTURAL SCHOOL, 38, Kennington-lane, London.—A sound practical knowledge of Analytical and Agricultural Chemistry, Geology, Surveying, Levelling, Railway Engineering, &c., may be obtained in Messrs. NESBIT'S Academy, in addition to a good modern education.

Mr. NESBIT'S works on Arithmetic, Mensuration, Gauging, Land Surveying, English Parsing, &c., are published by LONGMAN and Co., and may be had of all Booksellers.

MANURES.—The following Manures are manufactured at Mr. LAWES'S Factory, Deptford Creek:

Corn and Grass Manure, per ton	...	...	£10 0 0
Clover Manure, do.	...	...	11 0 0
Turnip Manure, do.	...	...	7 0 0
Superphosphate of Lime	...	...	7 0 0
Sulphuric Acid and Coprolites	...	...	5 0 0

Office, 69, King William-street, City, London.

N.B. Peruvian Guano, guaranteed to contain 16 per cent. of Ammonia, 9*l.* 15*s.* per ton; and for 5 tons or more, 9*l.* 10*s.* per ton, in dock. Sulphate of Ammonia, &c.

PERUVIAN GUANO.—As Agents of the Peruvian Government for the importation and sale of this valuable MANURE, we think it right, for the protection of consumers and respectable dealers, to apprise them that the adulteration of the article is still extensively practised, and to recommend them to apply either to ourselves, to our agents, Messrs. GIBBS, BRIGHT, and Co., of Liverpool and Bristol, or to dealers of established character, in whose honesty and fair dealing they can place implicit confidence. ANTONY GIBBS and SONS.

THE LONDON MANURE COMPANY beg to offer as under:

LONDON MANURE COMPANY'S WHEAT MANURE FOR AUTUMN SOWING.
CONCENTRATED URATE. SUPERPHOSPHATE OF LIME.
PERUVIAN GUANO. SULPHATE OF AMMONIA.
TURKEY AND AGRICULTURAL SALT, GYPSUM, and every artificial Manure; also a constant supply of English and Foreign LINSEED CAKE of the best quality.

The London Manure Company will guarantee the Guano they supply to be free from the slightest adulteration.

Bridge-street, Blackfriars. EDWARD PURSER, Secretary.

GUANO AND OTHER MANURES FOR WHEAT SOWING.—On Sale, Guano (finest Peruvian), Superphosphate of Lime, made from Bone, Bone-dust and half-inch, Dried and Prepared Night-soil, Urate, Gypsum, &c. Also Foreign and English Linseed Cake of the best quality.—Apply to MARK FOTHERGILL, 204 A, Upper Thames-street, London.

BY HER MAJESTY'S ROYAL LETTERS PATENT.

PATENT HOTHOUSE WORKS, KING'S ROAD, CHELSEA.

E. DENCH invites the attention of Gentlemen about to erect Hothouses, &c., to the vast superiority in every respect possessed by his PATENT HOUSES, which he will warrant superior in every respect to any others. Good Glass from 16 to 21 oz. per foot, 1 foot wide, 3 feet long, furnished, and the Houses, when completed charged, from 1*s.* 3*d.* to 1*s.* 6*d.* per superficial foot, according to size and quantity; on one principle the roof is formed without wood or putty, and on another principle with wood rafters, and the glass put in with putty. Patent Sashes, requiring no paint, from 7*d.* to 9*d.* per foot. HEATING BY HOT WATER.

THE CONICAL BOILERS INVENTED BY JOHN ROGERS, Esq., are supplied and fixed by JOHN SHEWEN, ironmonger, Sevenoaks. Also all kinds of Hot Water Apparatus. For Churches and Public Buildings, Mr. SHEWEN should be consulted, his Warm Air Apparatus being safer, more efficient, and more durable than any other.

FOR WATERING GARDENS, BREWERS' USE, &c.
FLEXIBLE INDIA-RUBBER HOSE PIPES.

JAMES LYNE HANCOCK, Sole Licensee and Manufacturer of the PATENT VULCANISED INDIA-RUBBER PIPES and TUBING.

These Pipes are well adapted for Watering Gardens, conveying Liquid Manure, racking Beer and Cider, Gas Fittings, Chemical and all purposes where a perfectly sound WATERPROOF and FLEXIBLE PIPE is required.

Hot Liquors or Acids do not injure them. No oil or dressing is required in using them. They do not leak from remaining out of use, are permanently Flexible in all Temperatures, and are therefore particularly suitable for Fire Engines; and, from their not leaking, are found exceedingly useful in conveying hot or cold water to baths in dwelling houses and such like purposes.

A LIGHT VULCANISED INDIA-RUBBER HOSE is now manufactured for conducting Water and Fluids, at the following prices per foot:

Size.	¼ in.	⅜ in.	½ in.	1 in.	1½ in.	2 in.	2½ in.	3 in.
1 ply ...	0*s.* 5*d.*	0*s.* 6*d*	0*s.* 8*d.*	0*s* 10*d.*	1*s.* 0*d.*	1*s.* 2*d.*	1*s.* 4*d.*	1*s.* 6*d.*
2 ply ...	0 8	0 9	1 0	1 2	1 5	1 8	2 0	2 3
3 ply ...	0 11	1 0	1 3	1 6	1 10	2 2	2 9	3 3

N.B. Vulcanised India-Rubber Garden Hose fitted with roses, jets, and branches, complete, with union joints ready to attach to pumps or water cisterns.

All orders or letters addressed to J. L. HANCOCK, at the Manufactory (and Warehouse), Goswell-mews, Goswell-road, London, will meet with immediate attention.

STEPHENSON AND Co., 61, Gracechurch-street, London, and 17, New Park-street, Southwark, Inventors and Manufacturers of the Improved CONICAL and DOUBLE CYLINDRICAL BOILERS, respectfully solicit the attention of scientific Horticulturists to their much improved method of applying the Tank System to Pineries, Propagating Houses, &c., by which atmospheric heat as well as bottom-heat is secured to any required degree, without the aid of pipes or flues. S. and Co. have also to state that at the request of numerous friends they are now making their Boilers of Iron, as well as Copper, by which the cost is reduced. These Boilers, which are now so well known, scarcely require description, but to those who have not seen them in operation, prospectuses will be forwarded, as well as reference of the highest authority; or they may be seen at most of the Nobility's seats and principal Nurseries throughout the kingdom.

S. and Co. beg to inform the Trade that at their Manufactory, 17, New Park-street, every article required for the construction of Horticultural Buildings, as well as for heating them, may be obtained upon the most advantageous terms.

Conservatories, &c., of Iron or Wood, erected upon the most ornamental designs. Balconies, Palisading, Field and Garden Fences, Wire-work, &c.

PURE WATER raised to any height from a small stream, where a fall can be obtained, by FREEMAN ROE and HANSON'S IMPROVED RAM; less waste, by two-thirds, than those ordinarily in use. Portable Steam Engines for Agricultural purposes, Threshing Machines, Deep-well Pumps, Water-wheels, Baths, Hot-water Apparatus, and Fountains. Towns supplied with Gas or Water. Drawings and Estimates made.—FREEMAN ROE and HANSON, Hydraulic and Gas Engineers; Office, 70, Strand, London.

DR. S. NEWINGTON'S AGRICULTURAL INVENTIONS.—An Illustrated Catalogue, together with a Lecture on the Seeding of Grain, and the after cultivation of the crops, sent gratis, on application to Messrs. DUFAUR and Co., 21, Red-lion-square, London.

The Agricultural Gazette.

SATURDAY, SEPTEMBER 7, 1850.

MEETINGS FOR THE FOLLOWING WEEK.

THURSDAY, Sept. 12—Agricultural Imp. Society of Ireland.
THURSDAY, — 19—Agricultural Imp. Society of Ireland.

THE value of science to agriculture does not at all depend upon the results of individual experience. Science is just the knowledge of the things with which the farmer has to do, and the more of that knowledge he has the better will it be for him. And we are happy to say that whatever blunders may have been made in the practical management of the farm attached to THE CIRENCESTER AGRICULTURAL COLLEGE, the natural sciences have been always well taught there. Taking it for granted, then, that all those farmers in its neighbourhood, who now look with a prejudiced eye upon that institution, are already perfect as practical men, they seem to forget that the very things in which they are deficient were always attainable there. Instead of paying all their attention to the farm, with the desire of finding all the fault they could, they ought to have anxiously inquired whether the things they did *not* know were taught upon it.

The idea they hold, and with which many from a distance come, that they shall find a model farm to have grown up in the two or three years during which Cirencester College has been in operation, is absurd to begin with; yet with all the untoward circumstances it has experienced—frequent change of management—occasional uncertainty of capital, and so on—its actual condition is not as it has been represented: the College farm is deficient in certain points only when compared with the picked farms of its neighbourhood—those of Mr. ANDERSON, Mr. BOWLY, Mr. LAWRENCE, and Mr. SLATTER: to put it beneath the general farming of the district is a totally unfounded statement. The spirit which actuates the harsh criticism it receives is both mistaken and impolitic: the one because it assumes and resents a sentiment which has had no part in the establishment of the College, and the other because it tends to the injury of an institution which, were it in thorough exercise and development, would be of great national value. Nevertheless it would be a good thing if this feeling could be either checked or disarmed of its bitterness; and we submit that the likeliest method of doing this would be to separate, in some measure, the farm from the College.

Farmers, whether rightly or not, will continue to hold that the results on the former represent the teaching in the latter; and, until the one is made a paying concern, it will not be believed that the other can furnish a sound agricultural education. It is understood that considerable modifications of existing plans are about to be carried out in the general management of the College as an educational institution. May not the present be a good time to carry out some such plan as we suggest for removing from it all the odium arising from its connection with an unprofitable farm? If free access to the farm were bargained for, it might be let to a skilful and energetic tenant without any loss of its value to the school: and a portion might be reserved sufficient for any experiments which the Professor of Agriculture might consider it for the advantage of his pupils to perform.

We understand that the number of students at the College has lately declined, and some think it might be more useful as an agricultural school. And it has been suggested that there is ample room for the co-existence of two departments within the institution—an upper school, or the College, at the present charge or a higher one, as 80*l.* per annum—and a lower or agricultural school kept quite distinct, at a charge that will bring in the sons of farmers at as early an age as from 10 to 16. However this may be, and whatever the ultimate fate of the institution, surely the circumstances out of which this decline in its usefulness has arisen admit of alteration—if it be wholly owing to misconception and torpidity on the part of the public, that admits of removal; but we believe that the necessity, now so generally acknowledged, that practical skill in the performance of agricultural operations is an essential part of agricultural education; and the feeling prevalent, whether it be just or not, that the skill of the teacher is indicated by the annual cash balance of his farm management, are among the most influential of the causes that have led to this result.

CHRONICLES OF A CLAY FARM.

(SECOND SERIES, No. VIII.)

THE concluding words of the conversation which had taken place (oh dear! what a long time ago!), between my worthy guest and myself over the breakfast table gave us both an inclination to go and look at the ploughing. A Wheat stubble which had been just drained was being broken up, for the next year's Turnip fallow. It was a stiff and rather thin soil, which had, to my long remembrance, been year after year suffering a continual loss, of that kind denoted by a deposit of fine sand at the bottom of each furrow, against the lower headland, from the silting away of the lighter particles of soil with the surface water that ran down them. I never used to look at it without asking myself 'How many hundred years has this been going on? and what must be the amount of deterioration of texture (to say nothing of loss of manure), which this field has suffered in the aggregate? Query—Would it be as stiff a soil as it has now the reputation of, if it had not been always parting with its sand by this continual process of superficial *scraping?*' When I came to drain it, I found that my suspicion was correct. Every here and there the subsoil was chequered by little 'pots' of pure sand, embedded in red clay, and so full of water that the drainer was obliged to tap them carefully to prevent large masses breaking off and rushing down with the fluid that burst out of them when the sides were cut through. The effect of the drainage was already most remarkable. The workmen called it 'beautiful;' and though nothing can present a more dreary look than a fresh drained field with all the cold varieties of subsoil lying exposed along the lines of the drains, I could not help feeling the truth of the expression applied as it was *prospectively* rather than to the actual scene before the eye. It was 'beautiful' in the same sense that many a rough-*looking* act, and many a painful soul-subduing thought, and many a rainy day of life's adversities, is 'beautiful'—by its consequences; and I always liked the word, so pregnant with faith in what is unseen except by the mental eye, that 'views the Future in the Instant.' Inexperience or ignorance would have called it intensely ugly, and would have preferred the previous smooth surface of the field, dank, cold, and intractable as it was before. What a pleasant effect upon the broad field of society it would have, if a few furrow-tiles could undermine some of the cold stiff surfaces one meets with here and there, through which nothing penetrates—in which no gentle plant takes root—while the lighter and better particles Nature originally gave, keep silting away, as life advances, leaving nothing but a hard and chilly surface growing colder and more impassive every day to all the genial influences which shower warmth upon the heart that will but expand to and accept them.

"Well! You *are* a-going deep to be sure!" said Mr. Greening, following the fresh-turned furrow and picking up an antediluvian lump of subsoil now and then, and crushing it between his fingers. "Why there's plenty of sand here: this 'll be mild enough for anything presently; you don't call this a stiff soil?"

"It has lain like a stubborn brute that wouldn't rise, for work or play, ever since I have known it. It won't know itself next year! It has never borne Turnip or Barley, since the Flood—which, in fact, it has never recovered, I suppose, till the draining-tools have bled it in this way. How little one can say what a soil is, till it is drained!"

"It does one's heart good to look at it now, however," replied Mr. Greening; "does'nt it make you *happy*-like to see this sort of change, and feel that you have done it? it does me."

"So happy, that at the end of a winter's day of draining-work I have sat for hours of delicious idle reverie, with the Lamp wasting beside me as I sat alone, dreaming the day's work over again; seeing with closed eyes, the long pent-up poison oozing away down its narrow channels,—poison no longer! and thinking of the future showers that will percolate and filter through the loosened soil and subsoil three or four feet deep, like some freed and gladdened thing, doing its bounteous Maker's bidding. I hardly know how to describe the sense of high privilege the thought brings with it—of being allowed humbly to aid, as it were, in Nature's glorious development. I know of no pleasure that surpasses it—or should surpass it—except one—except *one*—except ONE!"

"Goodness help us! why that's *three!*—And what may it be, after all, that lifts the knocker so many times for one visitor?"

"Look here, Greening! do you see that poor fellow cracking his whip over the horses in that lounging devil-may-care fashion? It's his first year at plough: he was 'kipping craows' for the last two or three. Isn't that a proper amusement for a thing with a human skull, and a real live human brain inside it? That's a promoted scare-crow! Does'nt he look happy?"

"Well! he's a right to do. He's doing his duty, is'n't he, as well as you and me! You can't do without him."

"Ah! yes,—yes! that's the answer. He's a machine——, driving a machine."

"Well—no—not exactly that, neither. They tell me a plough *a'i'n't a machine.* Come, I have you there for once, however. A plough's only a tool."

"True, true: a tool worked by horses, and dragging a man after it. You never spoke truer, Greening! And here we are somewhere near the middle of the nineteenth century, and talk of agricultural *improvements!* It shames me to think of it."

"What, ashamed o' the plough! O dear, dear! Well, I a'int, and never was, nor never shall be neither, that's *more*."

——"Too much, a little bit. How do you know you *never will be?*"

"Not however till something—— Oh, ho! I know now what you're after. *You're* a-driving now! Ay, ay! Now I think of it—they tell me you're always a-driving somehow against the plough. Well, what's the matter with it? So long as it's a good un, mind! Come now, I should like to hear from your own lips what you've got to say agin' it. I can *not* understand them books, so it's no use trying; and I *do* try, that's a fact; bnt as sure as I get half way down a page I go to sleep. A lot o' Chemistry and stuff! I'll back Common Sense agin' Chemistry any day. But I *should* like just to hear you on a bit about the plough—I think I could understand that; but you must please keep the words *close-cropp'd* you know—*no raspers!* A farmer's words should be like his hedges, I always think—plain and short and smooth-like, and not too many of 'em! and then they *may* help to 'fill the bushel' after all, p'rhaps. But about the plough—I beg your pardon—you was a saying something ——"

"No, no! go on, Greening! I like to hear *you.*"

"Well, I've done, i'faith! clean *out*, like. I'm your listener for half an hour—more, if you can spare it."

"Can you promise that? I've had many a useful hint from you—Could you sit and listen to my nonsense now, just for half an hour, straight on end—no snoring allowed, mind!—and what if I were to *read it*, instead of speaking? Now don't be frightened! it isn't a book—only a few sheets of paper poked away in a drawer somewhere, and scribbled over: fancy it a long letter from your ever affectionate brother beyond the sea, or a notice from your landlord that he's going to lower your rent, and giving all his reasons for it. Don't you think you could keep your eyes open?"

"Well, I think I could. But I hope it's in 'words of two syllables:' that's all I bargain for; and I'm your man, *now*. No time like present time!"

A few short steps homewards; a long rummaging over a drawer of papers; a great deal of settling down comfortably in arm-chairs; and, I'm afraid, a couple of cigars, followed this sudden resolution; and Mr. Greening looked wide awake, as the other casting his eye rapidly down the pages of a manuscript, which looked as if a swarm of spiders had crept out of the ink-pot and been playing at leap-frog over the paper—cleared his throat and began reading his

'Private notions on Cultivation.'

'There are three kinds of 'power' employed by man. The first is *manual* power, the second is *animal* power, and the third and most recent, is *mechanical* power. Each has its own peculiar *mode of action*; and refuses to adopt that of either of the others. The power of a man, from his erect figure, and the direction of his spine, acts most effectively in *lifting*. When he works at a winch, his greatest force is in lifting the handle from its lowest point in the circle, to about half way up. In pulling at the oar, or towing a barge, he inclines his figure so as to adjust it as much as possible in a direction perpendicular to the stress. In digging, he lifts the soil more than the plough does, and in pressing the spade into the ground he still employs perpendicular force, limited only by his weight. Manual labour is in fact most powerful in *perpendicular* action.

'But when the man gives up the spade, the hoe, or the flail, and employs his horse to cultivate or thresh for him, a new application of power becomes necessary. The back-bone of a four-footed animal is *horizontal*, not perpendicular, to the ground: and the adaptation of the power must be accordingly. The horse cannot *lift* and *press* the implement of cultivation, but he can *draw it along*; so the spade and the hoe are turned into tools of *traction*, and are *drawn* through the soil, raising it with the spiral wedge-like action of the plough, very damaging to the subsoil upon which the whole stress and hardening pressure come, but cheap and expeditious compared with the spade, so far as regards the mere *inversion*, or partial inversion, of the soil; though doing little towards its *cultivation*. Again, in threshing, the application of the horse's power must still be horizontal, like his figure, and his work be done by lateral pulling. The direction of animal power, in fact, is *horizontal*: and horizontal *traction* is the only form in which it can be applied.*

'But traction is not *necessary* to cultivation, nor is it even desirable. The plough, the harrows, the scuffler, and the horse-hoe, are only processes rendered necessary by the only possible mode of applying horse-power to the turning and breaking of the soil.

'*Mechanical* power is totally different: and has no more business to be applied *to the plough*, than a horse to a spade. When horses have been taught to dig, the steam-engine may perhaps be taught to plough: but nothing will be gained by either; because it is NOT THEIR MODE OF ACTION, respectively. The laws of Matter and of Motion are imperative; and pay no service to the stupid wall-eyed prejudice of man. Mechanical power has many modes of action; but whether wind, or water, or steam, be the driving agent, the favourite motion is the *vertically-circular*. The *horizontal* water-wheel is good, but extravagant, and of limited application; but it is worth mentioning as a singular exception. Where steam is employed, vertical-circular action is almost universal. Instance the steam-paddle, the screw-propeller, the common fly-wheel, the locomotive, the circular saw, the drum of the threshing machine, the steam pump, the Cornish engine, and many others that will occur to the recollection of the engineer. When we plough the sea, by steam, we do it with the circular blades of a paddle: *why not the earth?* When we cut wood into saw-dust by steam, we do it with the revolving teeth of a circular saw; why not the clod into soil as fine, by the *same mode of action?*

'What has the laborious dragging of a plough to do with steam-mechanism, whose mode of action lies in *rapid revolution*, which applied *behind* your locomotive (which must travel forward on the hard soil), could cut a trench a foot deep, and with its case-hardened tines, rasp away the soil from the land side to any pattern of fineness, as easily as a saw can cut a board—taking a moderate bite of six or eight feet wide as it—'

"'Gently *over the stones*!'" said Mr. Greening, suddenly waking up as the door opened and the crash of a fallen tumbler announced the entry of luncheon—"'a bite six feet wide!' my heart! who was it took that, sir! What a happy tite he must have had! What, luncheon a'ready! Well, it's uncommon interesting, I'm sure. Why, you'll be quite an Inventor! It's for all the world like what my little girl reads out to me o'nights from her 'Life o' Columbus'—somewhere in the beginning part, where he talks to himself so, till they all thought him out of his wits. I'm blest if it a'n't just like Columbus, as discovered America.—You ought to take a pattern out, sir."

"Did Columbus *take out a patent*, Greening?"

"Oh my! that's capital! a pattern for America! Well, that *is* a good'un, however; no, no, I guess what he discovered was a little too big for a pattern—'Wide as a world and broad as humanity,' as our parson says—No, no! he died quite the wrong side o' money-making, now I think of it.—But I wish you'd a' *talked it*, now, instead o' *reading*: for somehow the soft back of this chair o'yourn, and that—what was it—*piping-Dickler*—oh, dear; what a word that was; it sent me right off wool-gathering—I knew it would! I just shut my eyes to think it over a bit—and I was off like a shot. What *is* the use o' them long words—theyre just for all the world like the Spanish onions,—ha'n't half as much flavour in 'em as the little uns. That's what comes o' travelling abroad now! Blesh ye, them Romans and Antidaluvians as you 'a' been amongst, do'nt know no more about farming than a lot o'cockney tailors, for all their long words. Now do, sir, just try if you ca'nt *slice it up* like, into small words, so that a plain Englishman can understand it—"

——"And make it so plain that every one as he reads shall *think he knew it before*. Ah! that's the way to write—and talk—is'nt it, Greening! Well—come—We'll talk it over in plain English after luncheon." *Talpa.*

* Except in the case of a turnspit dog, or a squirrel in a cage, where it is applied to *generate* circular motion.

ON SHELTER FOR DUNGHEAPS.

Having within this day or two received the Journal of the Royal Agricultural Society, and although time has not permitted me to peruse it carefully, I have, much to my regret, observed a passage in Mr. H. S. Thompson's report to Mr. Pusey on the "Essays on Farm Buildings" wherein he disapproves of covered depôts for manure. I have not the pleasure of knowing who Mr. Thompson is, but from his address to Mr. Pusey, I suppose him to have been conjointly a judge of the merits of several essays for a prize on "Farm Buildings;" he must therefore necessarily be considered a high authority, and any *dictum* going forth publicly from such a person cannot fail to influence the opinions at least of that part of the agricultural community (and its name is unfortunately legion) who have not given a fair trial to roofed receptacles for manure.

Had Mr. Thompson been present this spring when my manure was carting out, and had he further witnessed the effects of it on my Turnips, some of them 700 feet above the level of the sea, and none under 600, on inferior land, he would indeed be a perverse man if he still maintained and continued to promulgate what appears to me to be a mischievous dogma. Inasmuch as Mr. Thompson appears a teacher in and contributor to the Journal of the Royal Agricultural Society, I submit to him as a legitimate question whether the opinion which he has so positively enunciated, is the result of a fair trial under his own immediate inspection, or whether it be founded on the information of any person or persons in whom he places confidence, who have given a fair trial to so important a matter. Meantime I will venture to submit my own humble opinion as antagonistic to his, however conscious I may be of the little weight it will necessarily have, in comparison to that of a person chosen by the Council of the Royal Agricultural Society to be an umpire in a question so vitally important not only to agriculturists but to the nation at large—"that of the best mode of constructing farm buildings."

It certainly does concern the Council of the Society to be cautious how they give forth opinions, which may mislead both landlords and tenants; and that the opinion which goes to discountenance the erection of a roof over a midden stead is an erroneous one, I can myself from the experience of years most amply testify; but then, I am met by the weighty authoritative sentence of a selected judge, whose fiat it may be deemed presumptuous to question, more particularly when the attempt is made by a novice like myself, whose proper location is on the great waters.

Who, with an eye in his head, and gifted with a particle of the reasoning faculties generally vouchsafed by a kind Providence, can help lamenting the wasteful mismanagement of manure on most farms, and more particularly on those of farmers who all their lives have been brought up to nothing else but agricultural employment, and who follow undeviatingly the practice of their fathers? What was more common than to see what ought to be manure exposed on an eminence to the alternate heats of summer, the blustering winds, the drenching rain and snow of winter—its essence wasting its fragrance in a puddling horse pond, or working its devious course to a running stream? Does this not require reform? and what reform more appropriate than by the erection of a roof to protect the manure from the vicissitudes of the weather—sinking tanks to receive the liquid from the stables, cowhouses, and piggeries, and at least weekly, pumping it on the mass which readily absorbs it—causing no undue fermentation, and helping to consolidate the whole, as it daily accumulates by the continual addition of strata, thus converted into fertilising substances. Such is the common practice at Gilgarran, not long since noted as the most sterile spot in the county, but now producing crops equal to any in it.

When I first commenced roofing my middens I had to contend with the jeers of my neighbours, and the deep rooted prejudices of my own people, who foretold an absolute failure and wasteful expenditure. But what say they now? That the manure when cut into has the appearance and consistency of the blackest peat moss, and that the improvement in it the very first year paid for all the expense: and so has it been as respects my stackyard, which has for several years been permanently roofed. Great was the discouragement offered to me, whilst this operation was in progress; but how stands the case now? It is visited from far and near by our most distinguished agriculturists, and their praise of it and my middens are unqualified. Several spirited gentlemen are adopting my plan; and yet, when a model of my stackyard was presented for their opinion to the sage judges of one of the annual Royal Agricultural shows a few years since, they did not deem it worthy of any other notice save that of their scoffs and jeers; thus dealing "a heavy blow and great discouragement" on an improvement which has elicited the unbounded plaudits of all who have seen its practical beneficial workings. I am forced to this egotistical vindication, in order that my own humble opinion, founded on strictly practical experience, may, so far as it can have weight, encourage enterprising men to adopt improvements in a great national interest, which all avow is so lamentably in the rear in this respect of other interests which do not so materially concern the public weal. Albeit that this vindication be opposed to the opinions of men of high sounding names, who perhaps may not have given a personal practical fair trial to experiments, which they nevertheless undertake authoritatively to write down. *James Robertson Walker, Gilgarran, Cumberland, August* 20.

THE SOIL AND THE AIR.

A Village Lecture.

(*Continued from p.* 507.)

Let me furnish other proofs of the fact that most of the bulky part of our plants is derived from the air: I have already proved it by showing that there is no other source except the air from which a plant can get its combustible part, and there are two other ways in which I can prove it—I can show you that the air is heavy enough to render it very likely that it contains enough of substance to grow plants of, and I can show you that it actually does contain the very things on which plants feed.

Why has the soil been always supposed to furnish the substance of plants? Is it because there is enough of it—good heavy stuff, that you might suppose able to build up heavy substantial plants and trees? Why the air surrounding the earth is at least 20 times as heavy as all the surface soil surrounding the earth—even supposing it to be on the average 12 inches deep? Though it is so easily moved through, the air is heavy enough, I can tell you. There are 15 lbs. weight of it resting on every square inch of ground. The whole atmosphere of the globe weighs as much as a ball of lead would weigh, though it were 60 miles in diameter. You can judge in some measure of the weight of the air by the way in which it will stretch a sheet of Indian rubber extended over an open jar fitted to the plate of an air-pump. If it were held at the four corners, and weights piled upon it they would stretch it, and if heavy enough they would break it; but if it rested on a stool they could not. Just so the air above it cannot stretch it now, because it rests on the air beneath: but remove the stool and the weights will stretch it: remove the air beneath, as can be done by this pump, and the air above will stretch it and burst through it.

But we can actually weigh the air. Take a bent tube, 3 ft. long, filled with quicksilver, and invert it. Why does the liquid metal stand 30 in. higher in one leg than in the other. If the air were pressing on both ends alike, it would stand at a common level in both branches of the tube; the reason why it is standing so high here must be because there is something pressing on the one surface which is not pressing on the other—the reason why it is standing so high in the one side is because the

air is pressing only on the other. The fact must be that the weight of the air pressing on the surface of the metal in the one leg of the tube is just the same as the weight of quicksilver above that level in the other. The air is supposed to be 45 miles high, and I say that supposing this tube extended 45 miles high to the outside of the atmosphere, this leg would contain the same weight of stuff in it as that, or else the balance would not be maintained. This is in fact a balance, weighing whatever is put into one leg of the tube by the height to which it will raise the quicksilver in the other; the air pressing here raises the quicksilver there to a height of 30 inches; that is, the weight of air pressing on every square inch of the earth's surface is the same as if 30 inches deep of quicksilver rested on every square inch. Now, 15 lbs. weight of quicksilver would rest on every square inch if it were covered 30 inches deep with it, therefore 15 lbs. of air rest on every square inch of the earth's surface. If I let the air in on this end again, you will see that the quicksilver (now bearing an equal weight of air on both sides) will regain the same level in each side; so that this is in fact a measure of the weight of the air.

When made in a more portable and elegant form it is called a barometer, from two Greek words which signify a measure of weight; and the height of the quicksilver in the tube indicates the weight of the air which presses it up; and as dry air weighs heavier than damp air, when the quicksilver sinks in the tube we anticipate wet weather, and so this tube becomes a weather glass, and when furnished with a float on the surface of the quicksilver it pulls round an index figure on a dial plate, and points to rain, fair, stormy, and so on; and this is the principle on which your weather glasses act. Well then we have just the same weight of air around the globe as if the surface of it were covered 30 inches deep with quicksilver, and that is as heavy as 12 to 20 feet of soil would be; and if you were never astonished at the 8 or 10 inches of soil being able to grow repeated crops of Grass or corn or trees without wasting away under the process, surely you ought not to be astonished at the air, which is 12 or 20 times as heavy, being able to do the same thing. The leaves of the tree do not indeed stretch through the whole air in search of food, as their roots do through the soil; but then the winds are continually mixing the particles of air up and bringing fresh ones to be fed upon by the foliage of the plants and the trees, so that *that* ought to be no hindrance in the way of our believing what is really the truth, viz., that plants get everything in them which will burn up from the air, and only their incombustible part —their ashes, which will not burn, away from the soil.

But now I will prove to you that the air really does contain, in the midst of it, the very particles of which wood is composed. I have here a piece of wood dried at a red heat, under circumstances which hindered it from taking fire; it is a piece of charcoal in fact, which is nearly all that remains of the wood after the water is driven out of it. Now, I say that the tree got this charcoal from the air, first, because it could not get it from the soil, which has not anything like enough of the stuff in it, and the air is the only other thing which the plant could get at to get it from.* Secondly, because the air is heavy enough—has matter enough in it to supply many such trees or whole forests, if they were wanted, from it—for it is many times heavier than the soil from which people generally think that such trees and plants do come. And, thirdly, I believe the tree gets its charcoal from the air because the air is not only heavy enough, but it contains the right things too; it contains the charcoally particles of this black substance present in it, as I shall now prove.

Take a jar full of oxygen gas; it is not common air, though air contains it, and it is to the oxygen that the air contains that it owes its ability to burn things, and its ability to maintain respiration—the breath of life in living animals. In the air this gas is mixed with another called nitrogen, which dilutes the former so as make it fit for the ordinary conditions of human life; were it not thus diluted it would be much too violent in its action. I have here a jar full of it, and you will see that it makes use of the least spark to produce a flame; so that if the air were pure oxygen every spark would end in a conflagration.

I shall burn this piece of wood in this oxygen gas. Now, on removing the wood I find a portion of it has disappeared—it has burned up—it has united with the oxygen gas, and is now in this jar in the form of a clear gas. The gas is of very different properties now; the oxygen gas being satisfied by union with the charcoal in this way has no longer any appetite, so to speak, for union with other things of the same kind; it will not now unite with the substance of tallow, and consequently so far from encouraging that chemical action which is productive of flame, it would extinguish flame immediately on its being brought in contact with it; and therefore also, so far from encouraging that chemical action which goes on during the respiration of animals, and to which the healthfulness of a fine bracing air is owing, it extinguishes that chemical action at once, and would choke any animal that fell into it; but to this point I shall refer again.

* The argument merely proves that all the carbon in vegetables came *originally* from the air. It does not determine what proportion of any particular plant came from the air, and what from the soil. In the early stages of its growth the plant derives a good deal of its substance from the soil, and some of even the carbonic acid of the air it may absorb through its roots. To supply the land with organic matter, in the art of cultivation, is necessary, not merely for the mechanical effort thus exerted on its texture, but for its use as food in supplying the plant with a portion of its organic part.

Now, if I prove that the air contains this gas, the carbonic acid gas, as it is called, which contains the charcoally part of wood, then I shall have proved that the air contains the very substances which we find in trees and plants, and which they take from it in the act of growth. And this is the way in which I prove that. The carbonic acid gas is recognised not only by its extinguishing flame and destroying life, but by this curious property, that when united with lime it forms a chalky insoluble substance; so that if I pour some clear lime-water into this jar of it, and shake it up, to induce the lime of the water to unite with the gas, it will become white and milky in appearance, owing to the formation of this chalky insoluble substance, as you see. Now, if I can pass a quantity of common air through some lime-water, and the lime-water originally clear becomes milky in this way, it will be because it, too, contains carbonic acid, and I shall thus have proved that there is in the air a gas which contains the very particles of charcoal which our plants and our trees require for their growth. Of course the air contains a very small portion of it, not so much as $\frac{1}{1000}$ of its bulk, because if it contained much it would destroy life instead of preserving it; and I must, therefore, employ an apparatus which enables me to draw a large quantity of air through a small quantity of lime-water; such an apparatus, in fact, as I have here, where the water below falls out and pulls the air in after it through the lime-water in this crooked tube; and you see that though clear before it is muddy enough now, owing to the formation of chalk in it, or carbonate of lime; and I have thus proved that the air contains the carbonic acid gas which was necessary to form this chalk, contains charcoal—contains the substance of our plants and our trees.

The air then contains charcoal, and gives it to plants. The fact is, that carbonic acid gas is a compound of charcoal and oxygen, you saw it formed when I burned the charcoal in the oxygen; and the fact is, that in the sunshine plants absorb the carbonic acid, take its carbon or charcoal, and give back its oxygen pure to the air. But before you can see the beauty of this process, for it does appear a really beautiful thing when rightly understood, it is necessary for you to know the properties of these two gases. Carbonic acid gas is "choke damp;" it sometimes collects in old wells and pits, and would then kill any one who enters them. It is heavier than common air, and so sometimes collects in deep places. There are places where this gas accumulates on the surface of the earth. There is a valley in the island of Java, in the bottom of which there is a spring of this gas, and accordingly the valley is a lake of carbonic acid gas, and it is, in reality, what it is called, the Valley of Death. Travellers who have visited it describe it as an utterly barren basin, with a rim of remarkably luxuriant vegetation, and the skeletons of animals cover the ground beneath; they had wandered in, been choked by the gas, and died. There was a skeleton of a man lying a little way down the slope; he had unwittingly entered the fatal lake of air, been intoxicated by breathing it, for it is a narcotic poison, and lying down, had died. No one dared venture to enter the fatal air to help or to recover a friend without the certainty of sharing his fate.

Now, wherever oxygen is uniting with charcoal, it is forming this deadly destructive gas; and every fire that burns, and every dungheap as it rots, and every breath that is drawn, is simply a uniting of the charcoally substance of wood or coal or straw or food with the oxygen of the air, and is constantly giving out carbonic acid gas. And the air, though it contains but little proportionally, contains a great deal of this gas actually. There is but $\frac{1}{1000}$ part of the air that is carbonic acid gas, but then there are 42,000 tons of air resting on every acre of the earth's surface, so that there are actually 4 cwt. of carbonic acid gas—a quantity containing 1 cwt. of charcoal—in the air over every square perch of ground; and this of course increases with every breath that is drawn and every fire that is burned, so that we might suppose in the course of years the atmosphere would become loaded with this gas, and animals would be unable to live in it; and no doubt this would ultimately be the case, for besides the fires which are thus making the air unfit for animal life, animals are rapidly making it unfit for themselves. Each of us gives out carbonic acid gas with the air we breathe—our lungs are in fact a little fireplace within each of us, where our food is in great measure burnt up, and our windpipe is the chimney by which the products of that combustion are sent into the air. It is in this way that the heat of the living body is kept up, whatever the coldness of the air. Whenever carbon unites with oxygen gas, heat accompanies the chemical action, and whether it be the coal in our fireplace or the straw in our dung-heaps, or the tallow in our candles, or the food in our bodies—the union of the oxygen of the air with the charcoal they respectively contain produce heat—heat in proportion to the rapidity of the process of union and the quantity of carbon in the fuel; and so in order to increase this heat, and induce the oxygen to combine rapidly with the charcoal, we build chimneys to draw the air through the furnace, or we turn over our dungheaps to cause the air to mix with them more thoroughly, or we run about and take exercise in order to breathe the faster; and so the furnace gets hotter, and the dungheap heats more rapidly, and we get warmer: or perhaps the heat is increased by using substances which contain more charcoal to unite with the oxygen gas, and in this way coke makes a hotter fire than wood, and oil or camphine a brighter heat than tallow; and for this reason, too, the Esquimaux of the arctic regions eats enormous quantities of blubber, while the inhabitant of the hot countries of India and China lives sparingly upon Rice. The heat in every case is proportioned to the quantity of charcoal which can be got in a given time to unite with the oxygen of the air; and so the cold-country man makes a perfect oil lamp of his lungs within him, and takes boisterous exercise to keep the bellows blowing, in order to preserve his warmth; while the hot-country man of placid temper and sluggish movement eats sparingly, employing less fuel because he loses less heat.

Now, I must not forget that I ought to be referring more especially to the fact that all these people and all living animals are loading the air with the poisonous gas which comes up through the windpipe chimney from the furnaces burning inside them. But let us still further digress for one minute, just to point out the fact which thus appears, that a large portion of the food an animal eats is in reality wasted—spent as fuel—burned up within it, just to maintain its bodily heat. And the farmer might take a hint from that; of course if his feeding cattle or sheep are exposed to cold and rain, they will need to burn more fuel to keep the heat of life within them. Keep them warm artificially, and less of the Turnip and hay which they eat will be burned up within them; keep them quiet in stalls or boxes, instead of in yards or fields, where they can run about, and the bellows will not work so actively, and the fire will not burn so fiercely in their lungs, and less of the food will be spent in the mere act of burning as fuel—more will be available for the purpose for which food is given, *i. e.*, for the formation of fat and the promotion of growth. It is not unfrequently the case that a lot of sheep, folded out in cold weather on the Turnip-field, gain no flesh at all. The fact is, every bit of food that is eaten by them is burned up within them just to preserve animal heat, and the farmer might just as well have thrown it all into the fire at once; but house those sheep, or feed them in sheltered yards, where they lose heat less rapidly, they will not need so much fuel to keep themselves comfortable, and some of their food will form flesh.

But now let us return to the fact that the air is being poisoned by all this breathing and fire-burning. You will find that a very little breathing through some lime water will make it muddy enough, proving how much more carbonic acid, and how much less oxygen, there is in the air that is breathed out than in the air that is breathed in. The fact is, the air we breathe out contains 100 times more carbonic acid than the air we breathe in. A man by the union of the air he breathes in with the carbon of his food in his lungs spits out in his breath in this way in the course of a year about 1½ cwt. of charcoal, as much indeed as there is in a sack of coals. Indeed the quantity of carbon or charcoal thus added to the air every year by the breath of all the animals, human or otherwise, in Great Britain, is estimated at 2,000,000 tons weight.

Well then the air would very soon become unfit for man and other animals to live in, were it not for the beautiful arrangement that as carbonic acid gas (CO^2) is sent into the air, plants remove it. As fast as charcoal in fires and candles and in food is uniting with the health-giving oxygen of the air, and forming the deadly CO^2, the plants are decomposing this carbonic acid, and taking the charcoal forming their own selves out of it, and giving back the health-giving oxygen pure to the air again; so that thus the air is maintained fit for use. It is only in the daylight or sunshine that plants have this power however, and you know that if you want to blanch a plant, a Rhubarb plant for instance, *i.e.*, hinder it from becoming woody, *i.e.*, hinder it from decomposing the CO^2 of the air, and so obtaining charcoal to form wood, all that you have to do is to keep it from the light. And again, if Wheat is too thick and luxuriant in spring time, so as to hinder the light from getting in upon its stems, those stems will be unable to decompose the CO^2 of the air—they will be unable, that is, to procure charcoal to make them hard and woody; they will be white and succulent, without strength, and liable to be laid by the rain; but mow those top leaves off, or let a lot of sheep bite them off, and you let the light in upon those stems, and they will regain the power they had lost, and they will strengthen and harden in consequence of again being able to procure their woody substance from the air. But that they can decompose the carbonic acid of the air, and, retaining its charcoal, give off the pure healthy oxygen, can be proved. I have taken a number of Cabbages, one after another, on successive days, cutting them about midday, when they might be supposed to be full of the gas, if ever they took any at all, and exposed them under water to the sun. Very soon bubbles of gas collected in the top of the glass, and on examination they have proved, by their ability to burn things brilliantly, that they were pure oxygen. Those Cabbages had been collecting the deadly gas as I and you were breathing it out, and as every chimney over a fire was sending it into the air, and they were decomposing it and sending the healthful part of it back to the air, and keeping the charcoal to themselves. See, then, how important the air is to plants, as well as to us; it provides them with all the woody part of their substance, it provides us with the breath we live upon and the fires that warm us. See how important the process of combustion, whether slow as in the case of ordinary decomposition, or more rapid as in the case of respiration and ordinary burning, is to plants. Unless in this

manner the air was continually supplied with this poisonous gas, plants might exhaust it of all the materials on which they feed and live. See how important plants are to us; they keep the air healthy for us, deprive it of those noxious gases which would otherwise soon collect and destroy us, forming their own substance at the expence of our enemy; so that the very thing which would destroy us is made to provide us with food and with fuel through their means. See, too, how admirably the growth of evil in the natural as well as in the moral world, is checked and made productive of good in the end, by the overruling hand of God's providence.

Thus much, then, we have learned regarding the air in connection with agriculture; it provides the plant with its woody substance, it keeps up the warmth of the living animal by burning a portion of its food in its lungs.

(To be continued.)

POULTRY MISCELLANIES.

4. The Feeding of Fowls.—Although a writer, having once sent forth his performance to the public, acts more wisely, as well as in a more dignified manner, by abstaining from all notice of the criticisms that may be offered upon it; still, some explanation may without impertinence be given to the readers of the *Agricultural Gazette*, why the statistics and calculations respecting poultry-feeding, required by a correspondent signing himself "Tau," were omitted in a recent publication. A courteous and reasonable demand, like his, deserves an answer.

One reason was, that no *general* rule as to the most economical food for fowls can be given, which shall be equally applicable to all circumstances and localities of Great Britain and Ireland. Thus, I am informed that in the West of England, Indian corn can often be purchased at such rates as to make it a cheap article of poultry diet; such is not the case here in Norfolk, though Rice may be often advantageously used. There is no doubt that each of the large sea-ports, such as Liverpool, London, Bristol, Glasgow, and Cork, offer some particular advantage of the kind to their neighbourhoods, if it be inquired after. Then, farmers have their tail or drop corn, which town residents can hardly come at, and which can scarcely be said to have a market value belonging to it. Millers have an unavoidable waste and amount of droppings, which can be saved from being utterly lost in no way that I know of, except by keeping poultry and pigeons to pick it up. So, it *is* saved and converted into money's-worth; but any professional valuer would be perplexed to put a value on it, which should go safely into any statistical tables and be quoted as an authority. Again, supposing that there were only *one* article of grain or other description of food on which poultry could be fed, and that of unvarying price all over the kingdom; still, the proportional amount of hand-feeding required by an equal number of fowls varies greatly, according to the circumstances of their owner. A head of 50 birds kept at a suburban villa, with high-dressed gardens and little other elbow-room, will not be able to obtain for themselves the same amount of unpurchased food as the 50 which belong to a small farmer, who has a common in front of his yard and a young plantation at the back. The 50 that are kept on a dairy farm will fare differently from the other 50 in whose master's barn the flail is perpetually going. Cochin China fowls, too, and Malays, will consume different amounts of food from bantams; and to strike an average on a miscellaneous collection, gives, in truth, only the phantom of a precise result. The only way in which a safe calculation of the exact quantity of food eaten by a given number of fowls, is to shut up that given number, *of the same breed and age*, and note what is consumed in a given time. But the experimenter should be warned that the birds, when first confined, will probably sulk, and not eat nearly so much as their brethren at large, and so an error will be admitted that would prove of considerable importance, if the calculations founded thereon were of equal consequence with those on which astronomy, navigation, or even large mercantile enterprises rely for satisfactory results. I have therefore thought it better to give "no account of the average quantity of grain each bird might be expected to consume," than to attempt giving such an account as I feel in my conscience must mislead, if it be made the ground-work of any calculation intended to be generally applicable. The best and most usual modes of fatting various poultry, such as pea-fowl, turkeys, guinea-fowl, geese, &c., have been stated, it is hoped, with sufficient fulness; but it is supposed that every one will and must depart a little, to the right or to the left, from any printed instructions, according as he finds that his own special means may be most judiciously made use of.

To meet, however, the wishes of "Tau," as well as may be, instead of aiming at any union-house-like infinitesimal apportionment of each crumb of provender to each eater, we will give a tolerably full account of our own stud of fowls at the present date, and of the way in which they are fed and managed. If a few other poultry keepers, at distant parts of the kingdom will afterwards send the details and routine of *their* fowl establishments, comparisons may be drawn and a selection from these different methods made, to suit the requirements of any amateur.

It may be premised that my own object in keeping fowls is not mere money profit. If it were clearly proved to me that at the end of the year I lost a small sum by them, I should still go on keeping them, for convenience and amusement's sake; and so would many other country ladies and gentlemen, and clergy. If it could be demonstrated to me that the eggs laid at home cost more per score than what eggs can be bought for in Leadenhall-market, I would still indulge in the home-produced article instead of French eggs 24 for the shilling, just as one would prefer a joint of home-fatted pork, although meat, spelled with the same four letters, might perhaps be bought in a neighbouring city one-eighth of a farthing cheaper per pound. If men want to enter on the business of fowl-dealing and fatting on a large scale, as a trade to live by, let them serve a short apprenticeship, and they will soon discover the most profitable way of proceeding, according to the produce and the demand of their own special locality. But I have never professed to write for this class of very useful persons, who are in general too acute, and too practically experienced, to need much instruction of the kind from books.

Another objection with me has been not to attempt the formation of anything like a *complete* collection or menagerie of poultry—though we have always wished to have plenty, both to observe and to eat—but rather to have a succession of breeds and species continually passing in review through our premises, to have their peculiarities noted, a pen-and-ink sketch of their portrait taken, and then, when what we fancy to be the secret of their life has been coaxed out of them, or shrewdly guessed at, to dismiss them as inconvenient supernumeraries, and replace them with less familiar faces. This mode is more suited to the income, the establishment, and the brains too, of most naturalist poulterers, than to have a vast, over-crowded, unwieldy aviary population, which distracts and perplexes the student as much as it pleases the common starer. There *are* minds capable of threading their way continuously through such a wilderness of interesting objects, and of carrying along with them at the same time a collection of clear and conclusive ideas; but such minds are not the majority, any more than Knowsley or the Regent's Park contain every-day collections. What the Earl of Derby and William Yarrell can do, is not expected to be done by everybody. It is wiser to attempt the performance of a feat a little below, rather than a little above one's powers.

Just now (July 1850), our stud consists of turkeys, geese, ducks, various breeds of fowls, pigeons, with their several young, besides guinea-fowl, guans, a stork, a brood or two of pheasants and partridges, and a few pair of cage birds, altogether about 150 head. At about seven in the morning during summer, those birds which had been shut up in their respective houses the night before are let out for the day. A sprinkling of Barley had been thrown on the floor of each house the previous evening. The geese (to begin with them), are driven into a large, well screened orchard (nearly an acre), that slopes slightly to the south, and contains a good sized pond. Here they have thrown down to them a few handfuls of Barley, as much as is thought sufficient for their gradually diminishing numbers, *i.e.*, about half a quarter of a peck for ten or a dozen geese. This, however, is shared with them by such fowls as choose to fly over the fence and join the breakfast party; the ducks too will frequently creep through and under the palings; so that although two or three additional handfuls may be given on such occasions, still if every handful, or even every grain were counted, no true account could be exactly rendered of the quantity of corn appropriated by the geese. Their principal maintenance is the Grass in the orchard, and we find that during summer they are thus kept in sufficiently good condition to kill into the house. During autumn and winter they require to be shut up to fatten in the regular way. About half this quantity of Barley is given at noon, and again at sunset in the court-yard, when they are driven up for the night at about 8 o'clock.

Our ducklings are kept pretty nearly in confinement, *i.e.*, in coops with small inclosures in front, from the time that they are hatched, till they are about a quarter grown. During this infantile state, they are entirely dependent on the food brought to them, consisting of bread crumbs, mixed Barley-meal, worms, &c. As soon as they are judged sufficiently robust to take to the water, of about an acre of which they have the range, besides open drains and ditches, they are turned loose with their nurse, but are always got home at night. Previous to this complete enfranchisement, they are, of course, disciplined by a few preliminary swims in a large milkpan sunk in the ground. If their nurse be a hen, they very soon desert her and cater for themselves; if a duck, then, under her guidance, they pick up by far the greatest part of their maintenance, costing nothing but the few kernels of Barley that are thrown to them three or four times a day, to keep them in the habit of returning home with tolerable frequency. Now it is impossible to make any calculation of what these birds consume, or are maintained by, that can afford real instruction. I cannot properly enter into any balance sheet the insects, worms, seeds, and water-weeds on which my ducks grow, get flesh, and even fat, although they are all the produce of my own premises. *De minimis non curat Lex.* The law careth not for crumbs and atoms. A farmer who wants to know the exact profit and loss on each duck and hen, would, we take it, be penny, or rather farthing wise, and pound foolish; that is, if his time and thoughts are worth money to him. And what most baffles us, is, that these savings which poultry get from off their walk, to the sparing of the Barley sack, perpetually vary. Thus, from Midsummer to Michaelmas, ducks cost very, very little to keep, where they have a proper range; and so do other poultry. Nature is then most liberal, but when the ground is petrified by frost and covered with snow, it is a different affair. Fowls are then at their most costly time. A calculation of the expense of keeping them at either period cannot but mislead. And as the greater number of ducks do not live six months, their yearly average consumption cannot be taken.

In the same way, turkey-chicks, and common chickens, are with us assiduously fed on their proper diet, their mothers being cooped, and dependent on the grain given them. As the younglings gain strength, they are gradually released; and, when finally turned adrift, have the range of more than 8 acres of lawn and grove, where their mothers and themselves find abundance of nutriment, which, though valuable, cannot be charged in any bill for the maintenance of the growing families. During the time the mothers remain cooped, a person goes round to them as often as thought needful, that point being much regulated by their respective ages, with a supply of suitable food. It mainly consists of hard-boiled egg chopped up with Lettuce and Onions, bread crumbs, boiled Rice (costing 1*s.* 4*d.* a stone) as a variety, Barley and fine pollard either mixed with cooked Rice, or by themselves mixed with a little water, as dry as can be to bring it to a consistence. Little chickens are treated to a few kernels of Wheat. The most economical way of distributing grain is to scatter it on the bare ground, and to give no more at a time than the fowls will quite consume; and we find that the only mode of preventing the sparrows from getting much more than their fair share (their really fair share would be none at all), is to remain with the birds and chicks while they are eating, till they are quite satisfied, and to repeat the visit at a short interval. Young chickens never should go more than two hours at most without a supply of food; for adult birds three times a day is plenty. It does not appear to me that extreme precision in stating the weights and measures of the articles used as food for live stock is so very necessary or expedient. For creatures that have either to work hard, or to grow, or to get fat, a little too much food is better than a little too little. We should prefer even some waste by sparrows rather than see our poultry stunted in their growth, or checked in their moulting, or moping about in ill-conditioned plumage. Full grown guinea fowl that have a range (and they should not be kept otherwise), require no more corn for their maintenance in health and full laying powers, than what they will have when the poultry is assembled by the corn measure at morning, noon, and night. With us, the least profitable birds are, we believe, the pigeons, of which there are about 40. Besides the corn which these get at the general mess, they are entertained with Peas (at the rate of about a peck a week), in their private apartment the pigeon-loft, to which, however, they are not at all confined. They are fed at an extra rate to prevent them from trespassing on our neighbours' fields. Pigeon pies in sufficiency could be had at a less cost, and the sale of choice pairs is not resorted to as a means of lessening the expense of keeping the flock.

The commissariat department of every rearer of a general stock of poultry must be arranged, not as for a regular army, where the men are all of a certain equal height, and are supposed to be of a certain equal capacity of stomach; but as for a mixed multitude or rabble, such as the followers of Peter the Hermit, or a disorganised riotous populace, consisting of old and young, male and female, healthy, sick, and lame. To the entire mass of this feathered band of insurrectionists (and very riotous they do become as the pangs of hunger continue to pinch them), it may be advised that three feeds of corn a day be administered till they are tolerably satisfied. It is an error to believe that poultry will eat corn to repletion; they will turn from that when they feel they have had a sufficiency of it, to pounce upon the fly, drag out the half-hidden worm, or crop the sprouting Grass. The waste of giving corn to fowls consists in throwing them down a large quantity at once, more than they care to have, and then leaving them to themselves, instead of doling it out handful by handful, and stopping the distribution as soon as appetite begins to flag. They should not be allowed to leave a grain. The juniors and the prisoners, and the invalids, must have separate attentions, which we are not expected to particularise here. For poultry that is put up to fatten loose in a small shed (really a good and more healthy way than fatting coops with separate compartments, for we never see a return of the birds which die instead of fatting from this incarceration), for poultry so confined no feeding trough is better than that figured as for turkeys in the "Ornamental Poultry," and a former volume of the *Agricultural Gazette*; but even the degree and kind of fatness expected in poultry is a matter of local taste and fashion. Most country people like a fowl, or a duck, that has been kept at large in high condition, either at the barn-door or in the pond, without any confinement at all; thus making an approach to the edible qualities of game. Londoners prefer birds that have never stirred, except in a dark cellar, nor used their wings, except to help them to a perch 3 feet from the ground, at most. This inaction of the muscles gives a peculiar tenderness to the flesh and unctiousness to the fat, which is much valued by metropolitan purveyors. As far as the digestion of the eaters is concerned, it would be well if the parties could exchange their tastes. The caponish and luscious peculiarity of the fowls supplied by the best London

poulterers, requires a little fresh air and exercise to settle comfortably; while the lightness of the barn-door flesh, if not eaten too soon after slaughter, is more suitable to a sedentary stomach. How hard, then, it is to dictate which is "the best mode of feeding and fatting" when connoisseurs differ so widely as to the result most worthy to be aimed at. *D.*

Home Correspondence.

Ought Farm-yard Manure to be decomposed before Led to the Field? is a question that has been discussed by a farmers' club, of which I am a member, and, by a show of hands, was decided in the affirmative. Boussingault, Thaer, Schwertz, Coke, and others have admitted the disadvantages attending the decomposition of farm-yard manure; yet the turning of the manure heap until, as some farmers say, black butter becomes black snuff, must be familiar to all that have passed through rural districts; and the "rivulet of blackish fluid, which is either wholly evaporated or lost in the ground," cannot be now foreign to their senses. We know, or ought to know, the essence of the manure is contained in the liquid; indeed, if allowed to remain long enough, the whole of the dunghill would run away in a liquid state; so that when practicable, and where attended with pecuniary satisfaction by its efficacious action, a person cannot be sane who would follow the practice of his grandfathers. M. Gazzeri ascertained that horse-dung lost more than half the dry matter it contained in the course of four months. Professor Johnston found, by the time the straw is half rotten, this loss amounts to one-fourth of the whole weight, while the bulk is diminished one-half. To increase its quantity and preserve its quality ought to be the aim of all. Half a yard of rotten dung ought to be equal in its effects to a yard of unfermented dung; yet the latter, when ploughed in in the autumn, has been found to produce better crops on all tenacious soils than the former, weight for weight. Soils of this texture are benefited by the gases evolved during fermentation, and by its opening tendency. "Some have even gone so far as to maintain that fresh excrements were injurious to vegetation. Proofs to the contrary are readily obtained; it is enough to recollect that in the grazing and folding of sheep and kine, the dung and urine pass directly into the ground of our pastures and fields, and who shall say that the land is not benefited by what it thus receives? Unquestionably fresh manures in excess prove injurious to vegetables; but as much may be said in regard to the best fermented dungs." (Boussingault.) Were we not guided by experience, perhaps we should be led to imagine there would not only be a saving of the ammoniacal salts, phosphates, &c., by applying it fresh to the soil, but that all soils would be equally benefited by being thus treated. Not so. The chemical action of the manure will be equally efficacious on light and heavy soils, but this is more than counteracted by the injurious mechanical action. Whilst unfermented dung will prove most beneficial to our clays, half-rotten dung will be most efficacious to soils of a medium texture, and rotten dung to our light ones. Decomposed farm-yard manure is no better adapted for every soil than one man is adapted for every profession. *George Summers, Stoke Wake, Dorset.*

Clover Failure.—Your remarks on my suggestions as to the probable cause of the failure of Clover, has led me to examine this subject more deeply. With our present knowledge on this mysterious subject, we can only avoid those enfeebling processes that tend to weaken the plant, and assist the injurious influences that cause the failure of the crop. This year one case only has come under my observation in this neighbourhood. The Clover in this field was fed too late, and saturated with water throughout the winter. Although I detected Orobanche growing on Furze, not far distant, with its peculiar brown or reddish scales, and didynamous monopetalous flowers—not a trace of it was to be found in this field. When sown, and when standing for a crop, there are few plants that depend so much on the weather for their success. Clover will grow luxuriantly even on sandy soil, in a wet summer, provided they are ploughed deeply, well manured, and in a low situation. I think most people will agree with me, that Clovers are much less precarious, in unfavourable seasons, on soils of close texture—on soils containing a portion of clay with an admixture of calcareous matter—when ploughed deeply, and well manured, than on any other soil. Most modern authorities affirm this assertion, but I trust to my own experience for its exactness. I reiterate my belief—the present culture of many is not deep enough to ensure its successful growth, in unfavourable seasons. These I take to be the causes of occasional failure; but there is a mystery yet to be solved. *George Summers, Stoke Wake, Dorset.*

Anbury.—Mr. J. Mainwaring Paine asks if any of your correspondents have suffered from the finger and toe blight in their Swedes this season. It has been very severe on the lower green sand in this neighbourhood, the stratum to which it is confined. It is prevented by a liberal application of the scrapings of roads made with calcareous gravel. An account of this was sent by me and printed in your journal about two years ago. If Mr. Paine requires further information, I shall gladly give it. *J. Clutterbuck, Long Wittenham, Abingdon.*

Disease in Turnips.—Attention has been directed to the serious losses which the Turnip growers suffer from the disease commonly called "fingers and toes." I have studied the subject for some years, and can corroborate the opinion of the Scotch farmers, that the only cure for this disease is to give the land a bare fallow, or to grow a crop of Potatoes, so that the Turnip crop may occur at an interval of 8 or 10 years, instead of 4 or 5, as usual. This bare fallow, or Potato crop, will protect the following crops of Turnips during several rotations. Lime is useful, though it is not so effectual as the above plan. If the Turnip fields be examined every year, it will be observed that if this system be not adopted, the "finger and toe" disease will spread further and further over the field, at each return of the Turnip crop. The diseased part of the Turnip sometimes contains the grub of an insect; but whether this is the cause of the disease, or the diseased Turnips are a favourable place for the development of the insect, we are unable to say. Such questions as this well deserve the attention of our agricultural societies, especially those which are now in the habit of distributing large sums of money in prizes for cattle; the comparative merits of the different breeds are now sufficiently well understood. Without for one moment undervaluing the benefit conferred upon agriculture by the prizes for cattle, we would recommend that prizes should be offered of sufficient amount to induce men properly qualified by previous study to devote their time to the elucidation of this disease of "fingers and toes," and a host of other similar evils from which the farmer sustains very serious losses. A 5*l.* or 10*l.* prize on this subject would only produce an essay that would be dear at the money; but let 100*l.* be offered, and there is some chance of the question being settled. As an instance of the benefit to be derived from such an inquiry as this respecting the "finger and toe" disease, we may mention that some portion of the Olive crop in France was yearly found to be destroyed by insects. A scientific gentleman was appointed by the French Government to investigate the subject, and by his suggestion (in those districts liable to this insect) the Olives are now pulled just before being quite ripe. The insects at this time have not reached maturity, and the crop is by this means quite preserved. There can be no reason why a similar investigation of the "finger and toe" disease should not be similarly useful. *T. C. L.*

The Cow Parsnip (Heracleum sphondylium).—Allow us to offer a few remarks in reply to your correspondent "Scotia" on the Heracleum sphondylium, and its uses for horticultural purposes. Although a common British plant, yet it is one of the most useful for cattle food, more especially for pigs and cows, which fatten upon it, also rabbits. We have some time since introduced and claim to be the first who suggested its general cultivation on the waste bogs, &c., in Ireland. With a view of confirming our ideas on this point, we have endeavoured this summer to improve it, and estimate its value, by the test of cultivation, from its seeds; and we are glad to say our expectations are fully realised; so much so, that we have obtained an extraordinary amount of green food from a small space of land. By judicious management it may be cut three times a year, as Lucerne. Its seeds must be sown in autumn or early spring, as it requires to lay a considerable time in the damp soil before it germinates. We shall feel pleasure in answering any of your inquiring correspondents relative to the improvement and cultivation of this native plant. Enclosed is a packet of our cultivated seed for your acceptance. *Hardy and Son, Maldon, Essex.*

Allotments.—Sir Arthur de Capel Brooke, Bart., has in the parishes of Great Oakley, Cottingham, and Middleton, 350 acres of land occupied by 170 tenants. The quantities of the holdings vary from 20 poles to 2 acres; but the greater portion are half acres. The smaller allotments, as roods and half acres, are either dug or forked with a strong three-pronged fork, 14 inches long and 8 inches wide. The acres are ploughed. The produce on those which are dug or forked were from 6 to 8 quarters last year per acre. The Wheat crops on these allotments this year are exceedingly good, but I do not think the quantity will be so good as last year. The heavy crops are much beaten down by the heavy showers. I observed both this and last year the best crops upon these allotments were produced from those plots which were dibbled with from 3 to 4 pecks per acre. The forward-sown Barley is also good. The Peas and Beans are partially injured by the fly. The Potatoes are much worse diseased than last year. It may not be improper to state that the crops now growing upon these 350 acres will be equal if not superior to any growing on the same quantity of land in this country respecting quantity and quality, when it is considered that 10 years ago this portion of land was woods in Rockingham forest, thickly planted with timber and underwood. The vast change that has been effected by the industry of the people in bringing the same into such a superior state of cultivation is praiseworthy to them, and must be a great satisfaction to the worthy baronet. *Jas. Miller.*
